Due to the extensive viewership, press attention, and extended discussion of issues in the campaign, scholars have paid considerable attention to political debates. For example, an estimated total of 53 million viewers watched the first presidential general election debate of 2008. 63 million were estimated to have watched the second debate, the largest number since the second presidential debate of 1992, with 69.9 million viewers (Moraes, 2008). Scholars have lavished considerable attention on presidential debates (books include, in chronological order, Kraus, 1962, 1979, 2000; Bishop Meadow & Jackson-Beeck, 1980; Bitzer & Rueter, 1980; Martel, 1983; Swerdlow, 1987; Jamieson & Birdsell, 1988; Lanoue & Schrott, 1991; Hellweg, Pfau, & Brydon, 1992; Hinck, 1993; Carlin & McKinney, 1994; Friedenberg, 1994b, 1997; Benoit & Wells, 1996; Schroeder, 2000; and Benoit et al., 2002). The Racine Group (2002) examined the literature on political election debates and concluded that, “few

deny that viewers find them useful and almost no one doubts that they play an important role in national campaigns” (p. 201). Loudan also has compiled a useful bibliography on political debates (2010b).

Televised presidential debates have several advantages for candidates and citizens. Debates are beneficial for candidates because they provide an extended amount of time for candidates to share their messages relative to television spots. Both candidates and citizens benefit from the extra time spent clarifying issue positions. Debates also provide free airtime for candidates to spread their messages, which is particularly important for candidates with smaller budgets and fewer television advertisements. Of course, even candidates with huge budgets can participate in debates. Candidates are able to reach millions of viewers nationwide that they might otherwise not be able to target.

Today, in the United States, participation in presidential campaign debates has become an expected part of the campaign (although the number of debates in which a candidate participates has varied from one in 1980 to four in 1960). As noted above, the first general election debate occurred in 1960. In 1964, President Lyndon Johnson declined to debate. Nixon, perhaps in part because of his loss in 1960, did not debate in 1968 or 1972. However, in 1976, President Gerald Ford decided to debate Jimmy Carter and the United States has had debates in every campaign since – as well as vice presidential debates in most years.

Debates also have advantages for citizens such as providing a somewhat more candid view of candidates other than from the media. Benoit, Hansen, and Verser (2003) argue that debates are unique in their influence over voters because they allow face-to-face communication between candidates. This format also allows for a direct comparison of issue positions and policy proposals. Unlike television spots, speeches, web pages, and direct mail brochures, debates offer a relatively unscripted performance of the candidate (Benoit, 2007). Candidates have less control over the content of the debate; even with prior knowledge of questions they are less certain what other candidates will communicate. Thus, debates provide a more candid view of candidates. Additionally, candidates do not have control over the production elements of this medium. For example, Scheufele, Kim, and Brossard (2007) argue that split screen shots – one candidate shown speaking and the other reacting in real time – allow viewers to see unintended nonverbal communication by the candidates.

The Nature of TV Spots and Debates

Benoit’s (2007) functional theory of political campaign discourse has been applied to political advertisements and debates. This theory posits that political campaign messages are intended to persuade voters that one candidate is preferable to another. This goal can be facilitated by the three functions of political campaign messages: *acclaims* (positive statements about one’s self), *attacks* (negative statements about

one's opponent), and *defenses* (refutations of attacks). These functions can be enacted on two topics: *policy* (governmental action, past and future, and problems amenable to governmental action) and *character* (the candidates' traits or personalities).

Functions and Topics of Political Advertising

Research (Benoit, 2007) on US campaigns (1952–2004) found that presidential primary advertisements used acclaims (72%) more than attacks (27%) and rarely used defenses (1%). The same relative proportion of functions occurred in general election presidential TV spots: acclaims (59%), attacks (40%), and defenses (1%). In both campaign phases policy was discussed more than character (primary: 54% to 46%; general: 62% to 38%). Roughly similar results have been found for non-presidential advertising (e.g., gubernatorial, senate, house) and for TV spots in other countries (Benoit, 2007).

We note that the emphasis on both acclaims and policy may seem high; however, news coverage emphasizes both attacks and character more than the candidates do in their advertisements (see Benoit, Stein, & Hansen, 2005). Generally similar results for function and topic have been observed for political leaders' debates in other countries (Benoit, 2007).

Functions and Topics of Political Debates

Research (Benoit, 2007) on US presidential debates has found comparable results (although defenses are consistently more common in debates). Presidential primary debates (through 2004) used 64% acclaims, 31% attacks, and 4% defenses. General election debates (1960, 1976–2004) used 57% acclaims, 33% attacks, and 8% defenses. Again, candidates in these messages tend to discuss policy more than character (primary: 68% to 32%; general: 75% to 25%).

Thus, in both forms of communication – TV spots and debates – positive statements about the candidate who is the source of a message are the most common function, although attacks on the opponent occur with some frequency as well. Responding to attacks (using defenses) is relatively rare and more common in debates than advertisements. Candidates generally focus on policy rather than character in their campaign discourse.

Campaign Media Effects

Today, the United States population is over 309 million (Census Bureau, 2010). It is clearly impossible for presidential candidates to meet even a tiny fraction of the

voters; so it is vital for candidates to use the media to reach voters (this is true of campaigns for other offices besides president, of course). For example, Herrnson (2004) observed that

With the typical [congressional] district containing approximately 646,000 constituents, candidates who wish to run competitive campaigns cannot rely solely on communications that involve direct voter contact, to say nothing of the difficulties faced by Senate candidates and an entire state's voting population. (p. 233)

Candidates may use the media to reach voters; however, the media have an opportunity to filter and comment on the candidates' messages. TV spots and debates allow candidates the opportunity to reach many voters without the gatekeeping of the media.

It is important to keep in mind that a given message does not reach every potential voter. Some voters choose not to watch debates; this choice is facilitated by the fact that many networks do not carry debates and because other media (DVDs, the Internet) are now available to citizens. The fact that presidential candidates can target where (in which media market) their advertisements are broadcast means some voters can not be exposed to a given campaign message. Furthermore, Stroud (2007) notes that "A substantial proportion of the public [...] consumes media sharing their political predispositions" (p. 358); some voters may elect not to use a given medium. Additionally, different voters can interpret a given message in divergent ways, which means the effect of a message can be mediated by voters' beliefs, values, and attitudes (including, of course, political ideology). Oliver and Krakowiak (2009) observe that "Effects of media on viewers are obviously not uniform – some individuals may be strongly influenced whereas others are impervious. [...] Individual characteristics may also heighten or intensify media influences, or may even provide a necessary condition for media influences to occur" (p. 525). Clearly, we must not expect that political advertisements will affect all viewers equally.

Minimal Effects Theory

The People's Choice (Lazarsfeld, Berelson, & Gaudet, 1948) is the classic source for the concept of "minimal effects" arising in the study of the effects of presidential campaigns on voters. Lazarsfeld et al. (1948; see also Berelson, Lazarsfeld, & McPhee, 1954) investigated a group of voters during the 1940 presidential election. The authors contended that campaigns have two main effects on voters: "activation," or "bringing their latent political attitudes to the surface," and "reinforcement," or "telling them what they wanted to see and hear" (p. 94). Only a few voters experienced another effect, "conversion," which was a change in preference from one candidate to another.

Another classic work was written by Klapper (1960), who argued that mass media are more likely to reinforce attitudes than to convert people from one candidate to another: “persuasive mass communication functions far more frequently as an agent of reinforcement than as an agent of change” (p. 15; echoing Lazarsfeld et al., 1948). Klapper suggested that these effects were largely due to *selective exposure* (people tend to consume messages which agree with their attitudes), *selection perception* (people tend to interpret using their existing attitudes), and *selective retention* in memory (information which agrees with a person’s attitudes should have more impact than discrepant information). Voters with less interest in the campaign tend to have less knowledge about the candidates. Thus, the voters who are most susceptible to persuasion (those with less knowledge) are less likely to pay attention to the campaign. Campbell (2000) wrote about the “minimal effects conundrum”: “Those who are most attentive to campaign information are the least open to persuasion by it and those who are most open to persuasion by campaign information are the least likely to be attentive to it” (p. 12, emphasis omitted). Zaller (1997) discusses this idea in greater detail:

The least aware rarely change their attitudes because, although likely to accept whatever they receive, they pay so little attention to politics that they rarely receive any new communication; the most aware receive new communication but are too critically inclined to accept its message, and so they maintain their attitudes unchanged; this leaves moderately aware citizens most susceptible to influence – they pay enough attention to politics to get net information but are not sufficiently astute to be able to react critically to it. (p. 299)

It is possible that those who are moderately aware could be less committed to their political attitudes; it may not be simply a lack of astuteness that makes such people more persuadable. Thus, early work on mass media generally and political campaigns in particular tended to minimize the effects of messages on voters and concluded that changing attitudes was much less common than activating or reinforcing attitudes.

In the 1990s, Finkel (1993) renewed the argument that the most likely effects of campaigns are reinforcement and activation of existing attitudes. He noted that “the *potential* does exist for campaigns to move individuals away from their vote dispositions” (p. 18, emphasis original), and he reported that conversion (changing vote preference) does occur in some voters. However, these effects tended to occur for both candidates with little net change in the campaign he studied (e.g., some voters who initially favored Reagan shifted to Mondale and others moved in the opposite direction).

A relatively new approach was developed by Campbell (2000), who advanced the theory of the “predictable campaign.” He notes that several factors tend to reduce the potential impact of election campaigns. First, many voters are relatively stable partisans (who will probably vote for their own party’s nominee). Second, some

voters make their vote choice early in the campaign. The state of the economy, which is known by voters before the campaign, is another factor in election outcome. Incumbency also exists prior to the campaign and (particularly in the House of Representatives) can be a significant advantage for candidates. Campbell argues that these considerations have a tendency to reduce the importance of the campaign. Campbell then observes that:

US presidential politics are very competitive. Usually the two major party candidates are relatively well-known. Both are relatively well financed. Both receive a good deal of media coverage. Both are taken as serious options by the voters. (p. 22)

The effect of highly competitive campaigns for the White House is a “leveling effect”: “Campaigns should generally have the effect of narrowing the difference between candidates” (p. 23). However, this does not rule out the possibility that a campaign could benefit one candidate over another.

Campbell (2001), looking for shifts in support that occurred during campaigns (postconvention polls to election day) argues that two campaigns, 1948 and 1960, were decisive, meaning that the candidate leading after the conventions lost the election after the general election campaign. He also indicated that three other campaigns (1976, 1980, and 2000) may have been decisive. He also concluded that there were significant shifts in support during nine other elections (1952, 1956, 1964, 1968, 1972, 1984, 1988, 1992, 1996), “but not enough or in the direction to have changed what appeared to be the electorate’s precampaign preference” (p. 446). So, his analysis provides evidence that voting preference can shift during the campaign, and that these shifts may be enough in some years to change the outcome of the election.

Zaller (1996) suggests that two reasons can explain why previous research has had a difficult time finding large media effects on the vote:

Failure to meet the prerequisites of most successful scientific enterprises, namely good measurement of variables that actually do vary. [...] Failure to develop sufficiently incisive models of the effects of competing communication. Almost all work has involved essential linear models that are [...] incapable of capturing many of the mass persuasion effects that may plausibly occur (p. 59).

Holbert and Benoit (2009) develop a theory of political campaign media connectedness, which considers multiple media simultaneously and argues for examination of both direct and indirect effects of political campaign messages (direct effects of a message in one medium and indirect effects of one medium via another medium). Although competing campaigns may mask the true effects, we lean toward Zaller’s (1996) conclusion: “The true magnitude of the persuasive effect of mass communication is closer to ‘massive’ than to ‘small to negligible’ and that the frequency of such effects is ‘often’” (p. 18). Thus, we believe media effects on politics can be important so it behooves us to investigate the effects of political TV spots and debates.

Effects of Television Spots

Because presidential (and other) candidates rely so heavily on television advertising, extensive research has been conducted on this medium. Effects studies of this campaign medium concern various topics such as issue knowledge and candidate issue positions, truth in advertising and negative ads.

Benoit, Leshner, and Chattopadhyay (2007) conducted a meta-analysis of political advertisements, comparing student and non-student populations when possible, assessing the effects of spots on issue learning, perceptions of character, attitude towards candidate, agenda setting, and interest in the campaign. Finally, they also assessed effects on turnout and vote choice. (We also report information about the data on which their conclusions are based to help appreciate the strength of these claims.) They found viewing political advertisements significantly affects issue learning: 13 sets of data with an n of 4,873 yielded a mean effect size of .21 (Benoit et al., 2007). They reported that students learn more from ads than other viewers, but both groups showed significant issue learning. Six data sets ($n = 2,061$) examined the effects of watching ads on perceptions of candidate character. The weighted effect size was significant at .19. Seven studies with an n of 1,113 found that ad viewing has significant effects on attitudes toward candidates ($r = .17$). Again, studies using students as participants had larger effect sizes than other studies, but the effect for both groups was significant. Three studies with a combined n of 351 found significant agenda-setting effects (watching ads increased the importance to voters of the issues addressed in the ads); the effect size was .19. Research also investigated whether viewing televised political spots increased interest in the campaign. Nine studies ($n = 4,561$) yielded a significant effect size: .22. Twelve data sets with a combined n of 8,266 found a small but significant effect size for increased turnout of .07. Three studies ($n = 1,067$) found significant effects of ad watching on vote choice with an effect size of .19. There can be no doubt that watching political advertisements can have significant effects on viewers.

Perhaps one of the largest areas of *polisplot* research concerns positive and negative advertising. Research on negative advertising is somewhat questionable. For example, some research on negative advertising utilizes coding schemes that often code the whole ad as negative or positive (Kaid & Johnston, 2001). Benoit (2007) argues that many ads include both positive (acclaims) and negative (attacks) statements in ads; many ads also discuss both policy and character. Coding each theme in a campaign message – as opposed to using the entire ad as the coding unit – provides a more accurate measurement of ad content. Some scholars, such as Ansolabahere and Iyengar (1999) have found that negative advertising results in the demobilization effect and that negative ads can induce political cynicism (Ansolabere & Iyengar, 1994). Ansolabere and Iyengar (1999) argue that citizens dislike negative ads, called mudslinging, and this in turn causes them to think negatively about candidates producing the ads, as well as candidates being attacked in the ads. For these reasons,

they argue that citizens feel less inclined to go to the polls and participate in the political process.

However, meta-analyses on advertising effects do not show significant decreases in voting intention from viewing negative advertisements. Meta-analyses on phenomena that have amassed a large number of studies are often preferable when available, because this analysis compiles individual results of studies and averages results for clearer picture of the phenomena (Rosenthal, 1984). With the exception of two election cycles, political advertising has been significantly more positive than negative (Benoit, 1999). Two meta-analyses demonstrate that negative advertising is not significantly more powerful than positive advertising (Allen & Burrell, 2002; Lau, Sigelman, Heldman, & Babbitt, 1999). Lau, Sigelman, and Rovner (2007) in a subsequent meta-analysis found that negative advertising might even produce a slight mobilizing effect, although not statistically significant. However, they argue that negative campaigns do have statistically significant negative effects on political efficacy and government trust.

Benoit (2007) argues that negative advertising may produce a voter trade-off. Some individuals may be disinclined to vote after viewing negative ads (with negative advertising decreasing turnout for those voters), but others could be more inclined to vote after viewing negative ads, voting against mud-slingers to punish them (increasing turnout for that group of voters; see Martin, 2004). One way that scholars have attempted to wrestle with the continued replication and contradictory findings is refinement of experimental stimuli. For example, Dardis, Shen, and Edwards (2008) tested exposure to issue and image attack ads and length of exposure. They found that greater lengths of exposure to issue ads decreased self-efficacy (which is thought to be positively related to voting). Another approach in light of this controversy, is to study the mechanisms behind negative advertisements and the appeal for parties and politicians. Obviously, despite several meta-analyses and numerous continued studies, it seems unlikely that scholars will resolve the debate regarding a global evaluation of the effects of negative advertisements. However, scholars are making attempts to refine research in this area and dig deeper in the causal mechanisms behind our reaction to these campaign strategies. There can be no question that presidential television advertising warrants further scholar inquiry.

Effects of Debates

Effects-based research on political debates is diverse. This section will provide a brief synopsis of various studies and conclude with a discussion of the meta-analysis that has combined similar research in this area.

Due to the importance and the unique nature of debates, many scholars continue to investigate candidate trustworthiness, persona, and persuasiveness in this message form. The first study to explore issue information acquisition during primary debates (Pfau, 1988) used a pre/postdesign and found significant results for candidate issue-

position learning. A unique approach was employed by Pfau and Kang (1991), who assessed the effects of relational communication in debates using an experimental design. Dependent variables consisted of general attitudes toward a candidate, likelihood for voting, competence, sociability, and character. The authors found that dimensions of relational communication measured in survey responses were significant predictors in evaluations of candidate attitude and likelihood to vote for a certain candidate. One study that combines these variables of trustworthiness and persuasiveness is by An and Pfau (2004). The authors used inoculation treatments (which refute arguments that will appear in a subsequent attack) predebate viewing to assess whether treatments would increase resistance to counterattitudinal messages (thus decreasing the effectiveness of those attacks) in debates. Findings from their study suggest that inoculation helps prevent decreases in candidate favorability by respondents.

Subsequent studies continue to tout the importance of debates for several participatory variables. McKinney and Chattopadhyay (2007) found that debate viewing increased political information efficacy, a factor influencing political participation. When independents and "undecideds" watch debates they learn issue and character information, leading to greater confidence in their ability to cast votes. Additionally, viewers have the opportunity to see all candidates for a given party, and studies report that equal issue-knowledge acquisition occurs for most candidates, not just the viewer's preferred candidate (McKinney & Carlin, 2004). Debates also have the potential to agenda-set by increasing the salience of issue stances and character traits (Benoit, McKinney, & Holbert, 2001).

Meta-analysis has been used to cumulate research on the effects of televised political debates. One variable concerns whether debate viewers learn about the candidates' issue positions after watching a debate. In general election debates, 18 measurements of this variable were cumulated from 13 studies with an n of 7,202 (Benoit, Hansen, & Verser, 2003); the weighted effect size was .256. Those exposed to televised political debates experienced significant increases in issue knowledge. Six sets of data from two studies ($n = 3,153$) found that debates increase the salience of issues to voters, with a weighted effect size of .187. General debates also had a significant effect on voters' issue preference – for example, does the voter support NAFTA or oppose it – (4 studies, $n = 625$, effect size of .136). Watching televised debates has an agenda-setting effect – making the particular issues discussed in debates more important to viewers. Three studies with an n of 216 yielded a weighted effect size of .291. Ten studies with 17 measurements found that viewing debates affected perceptions of the candidates' character ($n = 5,426$; effect size = .266). Tests investigating perceptions of candidate competence were not significant. Finally, effects of watching televised debates on vote choice were significant (25 data points from 14 studies, $n = 8,876$, mean effect size = .146). A few studies have also investigated the effects of watching primary campaign debates. Two studies with five unique data points ($n = 187$, weighted effect size .833) found that viewing primary debates significantly increased issue knowledge. Debates in this campaign phase influenced character perceptions (2 studies with 3 data points, $n = 169$, effect

size = .799). Furthermore, vote preference was related to debate viewing with an effect size of .541 ($n = 386$, 4 studies with 5 sets of data). So, the weight of research supports the conclusion that debates had substantial effects on those who chose to view them, with effect sizes ranging from .136 to .291 in the general election and .541 to .833 in the primary campaign. Although we have fewer studies (with a smaller n) of primary than general debates, it appears that viewing televised primary debates has a much larger effect. Presumably voters have more information and more strongly held attitudes by the time the general election debates are held.

Conclusion

Arguably, televised political spots and debates are the two most important campaign media today. Millions of dollars are spent on political advertising and millions of voters watch campaign debates. The Internet is increasing in importance over time (see Chapter 23), but it does not yet rival these more traditional campaign media in influence. With a population of over 300 million, candidates in the United States (as well as in individual states and other countries) must use the mass media. Both of these campaign media allow candidates to reach millions of potential voters. Meta-analyses of the research on these media demonstrate that political advertisements and debates have significant effects on voters – many with impressive effect sizes. Viewing political television advertisements increases issue knowledge, influences attitudes toward candidates, affects agenda setting, increases political interest, increases turnout, and affects vote choice: negative ads are not significantly more persuasive than positive ads. Watching televised campaign debates increases issue knowledge, increases issue salience, increases issue preference, affects agenda setting, influences perceptions of the candidates' character; effects are much larger for primary than general election debates. Furthermore, Holbert and Benoit (2009) have argued that it is important for future research on political campaigns to examine multiple media and investigate indirect as well as direct effects. Contemporary political campaigns (especially, but not exclusively, at the presidential level) match powerful candidates and campaigns. However, the idea that campaigns have “minimal effects” is simply wrong (see the recent exchange on this topic: Bennett & Iyengar, 2008, 2010; Holbert, Garrett, & Gleason, 2010). Clearly, more work remains to be done on the important effects of campaign media.

News and Political Entertainment Effects on Democratic Citizenship

Patricia Moy, Michael A. Xenos,
and Muzammil M. Hussain

ABSTRACT

For decades, political communication scholars have sought to better understand the various impacts of mediated communication on political behaviors that constitute the essence of democratic citizenship. Focusing on the key concepts of voter turnout, political participation, civic engagement, and political conversation, this chapter explores how various forms of media content shape individuals' political behaviors. It examines the extent to which these behaviors are a function not only of traditional news media, but also of political entertainment content, which in recent years has provided citizens with increasingly diverse perspectives about the political world. Discussion of these effects – and how they can change over time – is couched within larger issues related to the evolving media and political landscapes.

Manifestations of Democratic Citizenship

Driven by strong concerns about the state of democracy, political communication researchers consistently tackle a vast array of questions related to citizens' thoughts, attitudes, and behaviors. How do individuals understand and feel about issues in the world? To what extent and in what venues do citizens express their opinions? Under

what circumstances do they come to take action about problems in their community? The thrust of these intellectual undertakings relates to the role that communication plays in helping individuals to be knowledgeable and active citizens. An examination of findings from the last three quarters of a century reveals an increasingly nuanced set of relationships. No longer are large numbers of audience members influenced homogeneously by a few media messages. Rather, changes on a number of fronts – namely, the balkanization of media outlets, the fragmentation of content, and the growing recognition that individuals have certain predispositions that interact with message content – have necessitated another scrutinization of media effects on democratic citizenship.

Against this backdrop, we explore how citizens' use of contemporary media shapes their political behaviors. We are interested in the effects of individuals' consumption of not only traditional news sources, but also entertainment content that can have a political impact. Exemplified by *The Daily Show*, *The Colbert Report*, *The Late Show with David Letterman*, and skits that appear on *Saturday Night Live*, such content – which we refer to here as “political entertainment” or “political comedy” – has not only proliferated, but also witnessed a steady growth in viewership. With mass audiences turning more and more to such content for information about public affairs, elections, and other aspects of the political world (Brewer & Cao, 2008), scholars have been motivated to revisit the extent to which political entertainment shapes citizens' behaviors.

This chapter begins with an explication of key concepts that occupy a unique space in the political communication literature – voter turnout, political participation, civic engagement, and political conversation – and how these behaviors are shaped by traditional news media outlets. After a brief introduction to the newer forms of political entertainment content that exist today, we identify their effects on political behavior as well, focusing on some key mechanisms of influence. Our conclusions highlight a few fruitful areas of research that merit attention as we seek to enhance our understanding of how both traditional and non-traditional media bear upon political life.

Studies of citizen behavior are motivated by the desire to better understand and enhance democratic life. After all, democratic theory is predicated on the assumption that citizens possess adequate and equal opportunity to express their preferences, argue for their self-interests, and participate in the decision-making process (Dahl, 1989). Simply put, citizen engagement in politics lies at the heart of democracy – and studies of political communication. However, ascertaining the extent to which citizens are engaged in politics is muddled by scholars' differing approaches of what constitutes “political.” Scholars initially equated political engagement with *political participation*, most commonly reflected in behaviors that include voting, contacting elected officials, and taking part in protests or demonstrations. These acts initially were differentiated based on how easy or difficult citizens found them to perform (Milbrath, 1965). Subsequent research on political participation, however, moved away from this unidimensional view to identify four activity clusters: (1) voting; (2) electoral campaign activity (e.g., persuading others how to vote, attending political

rallies, and contributing money to a party or candidate); (3) cooperative activity, such as forming a group to solve a problem; and (4) citizen-initiated contacts, such as writing a letter to an elected official (Verba & Nie, 1972; Verba, Schlozman, & Brady, 1995). With few exceptions then, political participation traditionally has referred to citizens' actions reflecting a vertical (upward) communication from citizens to political institutions and elites (Moy & Hussain, 2011).

Any focus on behavioral manifestations of political engagement will identify voting as a key participatory act, traditionally viewed as "the entry-level stage of involvement" (Crotty, 1991, pp. 20/21). Concern with voting stems from the fact that it legitimizes the system (Niemi & Weisberg, 1993), and despite varying levels of turnout in the past several decades, is the most widespread form of political participation. While it may be the most widespread and egalitarian form of political participation, voting is also the act that conveys the least amount of information (Verba et al., 1995). If political participation were to be explicated based on the level of information each act conveys, then voting would rank quite low on this scale. After all, knowing that a citizen cast a vote or how he or she voted sheds no light on the motivation behind the vote. Voting, in other words, allows the politician minimal insight into the concerns of the electorate. Other forms of political participation, however, have the potential to convey considerably more information; for example, contacting a public official allows one to not only express concern for a specific issue, but also communicate the direction and intensity of opinion about that issue.

Like voting and other forms of political participation, *civic participation* affords citizens the opportunity to communicate concerns about their self-interests and the well-being of the group or community to which they belong. Civic participation refers to the *horizontal* communication between citizens to bring about improvement in their communities. Such participation is motivated by the desire to work toward a public good, but often involves interacting with others and typically does not involve electoral politics (Zukin, Keeter, Andolina, Jenkins, & Delli Carpini, 2006). Studies of civic participation have operationalized the concept to include volunteering in the community, giving to a community charity, attending town hall meetings and discussing the needs of the community, and working on a community project (see Moy & Hussain, 2011, for a review).

With its emphasis on horizontal communication, the concept of civic participation often has been viewed in the same light as *civic engagement*, which includes citizens' non-political activities as well as their sense of belonging to and trust in the ability of the community to mobilize and resolve collective problems (Kim & Ball-Rokeach, 2006). Similarly, *social capital* concerns citizens' relations to each other and how they work together effectively to meet shared goals (Coleman, 1990; Putnam, 1995a). Scholars have identified social capital as having two dimensions: social trust (or trust in others) and social connectedness (sometimes called "civic engagement"), reflecting the extent to which citizens connect with their communities (Putnam, 1995b). These connections typically tend to be measured by the number of civic associations to which one belongs, but scholarly debates over the operationalization of this concept

have raised questions regarding how best to capture informal community participation (see Moy, Scheufele, & Holbert, 1999 for a review). Regardless of the indicators employed, there is a general consensus that networks of civic engagement cultivate social trust, which in turn facilitates the ability of citizens to work collectively.

In many ways, the common threads between concepts like civic participation, civic engagement, and social capital reflect a larger trend in political communication research. Recent years have witnessed a resurgent interest in studying how citizens interact with each other to form individual opinions and achieve common goals. These interactions come in various guises, as noted earlier, but all involve some form of political talk. Indeed, if voting is the form of political engagement that conveys the least amount of information, interpersonal discussion of politics with others falls at the other end of the spectrum. As a communicative act, political discussion or deliberation allows citizens to express detailed information about their interests. It also helps citizens form high-quality political opinions (Cappella, Price, & Nir, 2002; Gastil & Dillard, 1999) as well as social identities that enable them to think collectively through political issues (Walsh, 2004). In the context of national political campaigns, political talk generally serves to “filter [...] information from the macro political environment” in beneficial ways (Pan, Shen, Paek, & Sun, 2006, p. 317). Not surprisingly then, political talk has come to figure prominently in contemporary research on media and democratic citizenship. After all, interpersonal discussion of politics is linked to participation in public forums and other forms of political engagement (Kim, Wyatt, & Katz, 1999; Knoke, 1990; Leighley, 1990; McLeod, Scheufele, & Moy, 1999). Indeed, the absence of regular and meaningful deliberation can lead to political alienation, not to mention poor public policy (Moy & Gastil, 2006).

What constitutes meaningful deliberation? With its Aristotelian roots, face-to-face conversation may be at the heart of democracy, but contemporary scholars believe that not all talk is equal. On the one hand, sociable conversation occurs with like-minded others and has no real goals. Problem-solving conversation, on the other hand, is more democratic; it often involves non-like-minded others and is public in nature. In this model of conversation, the act of speaking to others is a means to the end of good government, which presumably focuses on the common good (Schudson, 1997). Regardless of whether the deliberation occurs in formal town hall meetings, semi-structured online chat rooms, or informal interpersonal settings, the study of political talk reflects an emphasis on horizontal communication between citizens that can shape participants’ understanding of public good, their understanding of the issues involved, and perhaps policy.

Effects of Traditional News Media

Efforts to map the influence of “traditional” news media on various forms of political participation and civic engagement have generated relatively consistent findings,

despite different conceptualizations and methods adopted by scholars. Of course, to define a medium or outlet as long-standing is a moving target. By “traditional,” we refer to newspapers and television, the two media that have provided news about public affairs and the political world and have captured the attention of virtually all scholars interested in media influences on the aforementioned forms of citizenship. And although the Internet has not existed for as long as the other two media, it does serve the critical function of keeping the public informed about current affairs, especially as traditional news organizations have moved online to reach potential audiences every minute of the day.

Just as citizenship can be operationalized in numerous ways, scholars have taken different approaches to the study of media use. Survey measures of the concept, which provide the basis for most of the research in this area, have tapped respondents’ exposure to a given medium (e.g., the number of days one reads a newspaper or the number of hours one watched television the previous night), attention to specific content (e.g., international news), and motivation to use that given medium (e.g., how often one uses the Internet to learn about community events). In addition, research study designs vary greatly. Some opt for experiments employing media-based stimulus materials that differ in content (e.g., newspaper campaign coverage that is oriented primarily toward policy stances vs. campaigning strategies), while others rely on cross-sectional survey data. Such theoretical and methodological inconsistencies may generate differences in findings.

Mass media use – in particular, exposure and attention to public affairs content – tends to be positively related to political activity that defines citizenship. Such use typically enhances the likelihood of engaging in electoral and campaign-related behaviors (McLeod & McDonald, 1985; McLeod et al., 1996) as well as civically oriented acts (Moy, Manosevitch, Stamm, & Dunsmore, 2005). The mechanisms underlying these relationships may differ, however.

Newspapers

In the nineteenth century, Alexis de Tocqueville (1884) theorized that newspapers promoted civic engagement in the United States. A century later, cross-medium comparisons sustained this conclusion, typically painting newspapers in a better light than television. This is true of the earliest research relating use of the two media to the likelihood of voting. “When practiced jointly, newspaper reading and television watching are associated with very high rates of turnout, but television may ‘add’ less to the combination than newspapers” (Glaser, 1965, p. 85). In the first two decades when television appeared on the media landscape, between 1960 and 1976, turnout declined only 1.5% for those most reliant on newspapers, compared to over 10% for those least reliant on newspapers (Shaffer, 1981). And data from the Center for Political Studies reveal that of the most politically apathetic, nearly three-quarters (74.8%) reported television to be the medium they used most often; the corresponding

figure among the most politically involved was 58.9% (Bennett, 1986). Positive relationships between newspaper use and citizenship continue to emerge: Newspaper reading tends to be associated with higher levels of civic engagement (Shah, Cho, Eveland, & Kwak, 2005), voting (Wilkins, 2000) or the intent to vote (Drew & Weaver, 2006), and political conversation (Kim, Wyatt, & Katz, 1999).

These positive effects are not only direct effects, but also can involve different mechanisms of influence. Reading newspapers can increase what citizens know about politics (Robinson & Levy, 1986, 1998), and increased knowledge is associated with greater political activity (Bennett, 1986; McLeod et al., 1999). Newspaper reading also imparts information as to how citizens can actually participate (Lemert, 1981), which in turn can increase the likelihood of partaking of traditional acts of participation. Citizens who read newspapers also tend to become more integrated into their communities, which in turn increases their level of investment in seeing that local problems get resolved (Stamm, 1985). In addition, newspaper reading can facilitate unintended political discussion (Chaffee & Mutz, 1988) that can interest less engaged citizens. In general, those who discuss public affairs issues within their social networks experience differential gains; that is, these individuals are more likely to participate than those who engage in either newspaper reading or political talk alone (Scheufele, 2002).

Television

Unlike the relationship between newspaper reading and political behavior, watching television news tends to elicit more negative associations. Moreover, that the effects tend to be mixed may stem from the use of different measures and/or the range of content available through this medium. For example, watching campaign news on television has been negatively related to the likelihood of voting and other forms of conventional political participation (McLeod et al., 1996). However, exposure and attention to national and international news on television has not been related to either voting or political participation (Eveland & Scheufele, 2000). Yet other research has found that watching “hard” or serious news on television correlates positively with participation in formal electoral politics (e.g., voting and belonging to political parties; Wilkins, 2000). The effects of watching televised news can be positively related to political participation: This type of media consumption translates directly into greater attendance at political meetings, contacting public officials, working on campaigns, and writing letters to the editor (Scheufele, Nisbet, Brossard, & Nisbet, 2004). Thus, although the evidence is far less conclusive than for newspapers, the bulk of the literature suggests television news can facilitate various forms of political participation, particularly when the content is germane and viewers’ attention is sufficient.

Like newspaper reading, watching television news equips citizens with knowledge regarding current events, policy issues, and political actors; armed with this

knowledge and information, citizens are more likely to engage in political action. As well, the very nature of the medium allows television news viewing to facilitate political action. With its reliance on visual cues, broadcast stories often involve compelling visuals and sound bites that generate political interest, another commonly identified antecedent to engagement in political activity. Visuals may also have more powerful effects in the long run as individuals learn to process visual cues before they learn to process verbal cues, and thus audiovisual cues can reach a much broader audience, starting at a much younger age (Graber, 1996). While print media are deemed superior in terms of the amount of political information they convey to audience members, newspaper stories have grown longer and increasingly oriented toward analysis and interpretation (Barnhurst & Mutz, 1997), some of which may be beyond the level of understanding and interest of average citizens.

With respect to civic engagement, scholars have long debated how television can have an impact. In his time displacement hypothesis, Putnam (1995b) contended that the time citizens spend watching television has driven them away from their communities. According to this line of reasoning, the act of television viewing has privatized citizens' leisure time and inhibits participation outside the home; after all, one cannot at the very same moment sit at home watching television and serve as a intramural volleyball coach. Therefore, where citizens once were socializing with one another, working on community projects, and joining bowling leagues, with the penetration of television, they now are engaging in singular activities and "bowling alone" (the title of Putnam's [2000] seminal book). Despite the intuitively appealing nature of this argument, researchers have found no support for the time displacement argument. The time that citizens spent watching television had a direct negative impact on civic engagement; it did not decrease levels of engagement through perceptions of time pressures (Moy et al., 1999). Moreover, despite the prevalence of entertainment fare on television, it is media content not time spent with the medium, that appears to make a difference (Norris, 1996), as illustrated later in this chapter.

Today, as measures of television viewing and political behavior and analytic techniques have become more sophisticated, a nuanced picture of effects has emerged. Television news viewing enhances citizen activity indirectly (McLeod et al., 1999): A television news story generates political discussion, which leads citizens to turn to newspaper coverage of the issue, and reading the news increases political knowledge, which heightens one's belief that the system is responsive. Perceptions of efficacy then make it easier for citizens to take action. When it comes to deliberative conversation, the effects of television news are not as optimistic (Moy & Gastil, 2006). The more citizens watched television news, the more open to political conflict they reported themselves to be. Unfortunately, watching television news was also associated with lower levels of understanding of others' views. Because deliberative conversation is characterized in part by the use of logic, clarity of expression, turn-taking, openness to conflict, and the understanding of differing viewpoints, this finding

suggests that television news shows – a genre that now includes much incivility in political discourse – may be moving viewers toward an understanding of political talk that is less than ideal by deliberative standards.

The Internet

The rise of the Internet to political prominence has spawned a debate that has yet to be answered fully. Will new media technologies promote democracy by lowering the cost of communication and participation (Rheingold, 2000) or will they merely be an extension of the existing polity and not lead to significant changes in political behavior (Margolis & Resnick, 2000)? Early empirical research in this area generated inconsistent findings. For example, use of the Internet was shown to be unrelated to voting (Bimber, 2001) and to increase voting (Tolbert & McNeal, 2003); both studies, however, found Internet use to increase the likelihood of engaging in other forms of political participation.

But as scholars' understanding of what it means to "use" the Internet has grown more sophisticated, so has their understanding of the medium's political implications (see Chapter 23). Socially, informationally, or politically motivated uses of the Web increased civic participation behaviors, while using the Internet for household or social recreational use detracted from civic participation (Moy et al., 2005; Pasek, Kenski, Romer, & Jamieson, 2006; Shah, McLeod, & Yoon, 2001). Among the general US population, exposure to online campaign information was associated only with acts of civic participation. And among citizens who expressed greater interest in politics, exposure to online campaign information was associated with higher levels of civic participation, political participation, and political talk (Xenos & Moy, 2007).

Today, the Internet is like television in that it offers citizens a vast menu of content choices. Unlike television, however, the breadth of choices on the Web appears to proliferate with each passing week. As candidates, campaigns, and causes spend increasingly more time shaping their online presence so as to garner support, and as citizens consider reading blogs and joining social networking sites *de rigueur*, scholars are forced to revisit the effects of the Internet on democracy. The breadth of the Internet allows not only for obtaining information from different websites, but also for engaging in different activities online. As Gil de Zuniga, Veenstra, Vraga, and Shah (2010) noted, the range of political activities available to the public goes beyond the traditional measures of participation that scholars have employed for nearly a half-century. Indeed, as technology has developed, so too has views on what it means to produce and consume messages. Blogging allows citizens to become message producers, to express themselves to a potentially unlimited audience, to inform, and to mobilize. Similarly, political engagement has become increasingly common online via the use of social networking sites, according to a Pew Internet and American Life study (Smith, Schlozman, Verba, & Brady, 2009).

Political Entertainment and the Evolving Media Landscape

The fragmentation of content in today's communication environment is evident in the proliferation of websites and television channels, with many dedicated to a particular issue, obsession, or quirk. Concomitant with this multiplying of sources is how the same content is conveyed across different outlets. For instance, a political advertisement that gets aired once in a small market can receive national coverage by virtue of being included in an adwatch that is covered on network news (in which, for instance, a political analyst comments on the ad), taped and uploaded to YouTube, and referenced in numerous political blogs and "tweeted" through social networks. The clearly delineated media environment of the twentieth century is no longer.

Against this continually shifting media landscape, political communication scholars have turned their attention to examining the political effects of "infotainment," sometimes referred to as political comedy or political entertainment. The contemporary incarnation of political comedy – as reflected in late night talk shows – has gained political traction as candidates attempt to convey messages about themselves and their policies to audience members who are not typically politically engaged. Moreover, politicians can convey these messages without the filter of a journalist, whereby they risk having carefully crafted messages reduced to a sound bite. Consequently, the viewer who previously could escape the political world by turning to entertainment content has lost the ability to do so.

But political comedy is not a product of contemporary broadcast media. Laughter has long played a role in political discourse. Ancient Greek comedies, as exemplified by the works of Aristophanes, entertained audiences by satirizing political and social life equally (Bates, 1903; Heath, 1987/2007). In *L'Homme aux quarante écus*, Voltaire employed satire to criticize certain economic and political perspectives. These two exemplars from markedly different time periods illustrate just how political comedy has preceded the accounts that interest political communication scholars today. With their focus on electronic media, political communication scholars begin somewhere in the territory of Richard Nixon's 1968 utterance of "Sock it to me?" on *Laugh In*, or with references to *The Smothers Brothers Comedy Hour*. Typically, this quickly gives way to more contemporary pop-political culture reference points such as Bill Clinton's appearances, in 1992, on *The Arsenio Hall Show* and MTV, Al Gore's and George W. Bush's appearances on late night and daytime talk shows in 2000, and John Edwards' formal announcement of his presidential candidacy on *The Daily Show* in 2003. Undoubtedly the list soon will include mentions of Tina Fey's unforgettable *Saturday Night Live* parody of 2008 Republican vice presidential candidate Sarah Palin's interview with Katie Couric, which seemed to capture the public's attention as much as the original event it was meant to mock.

These iconic events signal how politicians have become increasingly reliant on popular, entertainment-based media outlets as means to reach potential voters.

These landmark appearances also draw attention to the explosion of media (television) channels. In 1968, the year in which Nixon appeared on *Laugh In* to soften his image, television audience members could access half-a-dozen channels (Bogart, 1972). Nearly a quarter-century later, however, when Clinton aimed to reach a younger audience by donning a pair of Ray-Bans and playing the saxophone on the *Arsenio Hall Show*, the media landscape had changed drastically. Cable channels had penetrated over half of all television households (Prior, 2007), offering viewers access to CNN, HBO, Showtime, Nickelodeon, Lifetime, and a host of other networks. This proliferation of specialized cable channels in the 1980s and 1990s would continue into the new millennium. What had started as a low-choice, broadcast-dominated communication environment with ample opportunities for incidental learning and widely shared political points of reference (Prior, 2007) had evolved into a balkanized media landscape with highly segmented audiences.

This “stratamentation” (stratification with fragmentation), as Bennett and Iyengar (2008) term it, does not necessarily mean that audiences are shrinking. Politicians’ appearances in televised political comedy today, even if viewed by relatively few in its original broadcast, can reach millions via television network websites, blogs linked to the footage, and YouTube. Multiple exposure to the same content consequently has challenged scholars to pinpoint when and under what conditions citizens were exposed to the content in question, and to ascertain the effects of such content.

Regarding the effects of political entertainment on political behavior, research in this area is characterized by mixed findings. On the one hand, Prior’s (2007) research suggests that the mere presence of entertainment options in the media landscape may dampen political engagement among significant portions of the public and exacerbate inequalities in participation. Consistent with this line of reasoning, a number of studies have found either null or negative relationships between “non-traditional” news sources and engagement or participation variables. These sources include political comedy shows such as *The Daily Show* and *Saturday Night Live* (Cao & Brewer, 2008) as well as late night talk shows like *The Late Show with David Letterman* and *The Tonight Show* (Moy, 2008; Pfau, Cho, & Chong, 2001). Furthermore, entertainment-oriented content that includes sitcoms, dramas, as well as talk shows has a direct negative effect on civic participation (Keum, Devanathan, Deshpande, Nelson, & Shah, 2004).

On the other hand, political entertainment programming has produced democratically desirable behavioral outcomes. These positive effects appear in the form of either direct relationships with traditional political engagement variables, or with variables that are highly associated with participation such as expertise, efficacy, and attentiveness. For example, Cao and Brewer (2008) found positive associations between attention to political comedy shows and certain political activities such as attending campaign events and joining organizations. Additionally, in a comprehensive study of multiple forms of mediated political communication in the 2004 presidential campaigns, Pfau, Houston, and Semmler (2007) concluded that, “the influence of television entertainment talk shows such as *Late Night with David Letterman* and

The Tonight Show with Jay Leno was associated with greater likelihood of participating in the democratic process” (p. 125).

Given the relative dearth of studies that link political entertainment or non-traditional news sources directly to political behavior, scholars have taken to examining the process by which such a relationship can emerge and identifying other politically relevant factors that might influence behavior. For example, during a campaign season, watching entertainment talk shows can influence viewers’ political expertise and attitudes about democratic processes in general (Pfau et al., 2007). In addition, exposure to political comedy can increase viewers’ confidence in their own political abilities (Baumgartner & Morris, 2006) and stimulate interest in the world of politics and campaigns (Feldman & Young, 2008). Political attitudes and cognitions, particularly those related to political trust, matter as trust and engagement tend to move lockstep with each other. The evidence is mixed regarding how viewership can affect trust in traditional news media (Baumgartner & Morris, 2006; Moy & Pfau, 2000), but a recent study revealed that exposure to comedy shows is negatively associated with general levels of political trust, while exposure to talk shows is associated with greater trust in political parties (Tsfati, Tukachinsky, & Peri, 2009). These findings have strong implications for how consumption of political entertainment content can influence behaviors, with the process turning on the specific content of interest and the extent to which citizens trust particular institutions and/or officials.

Other patterns in the literature hinge upon individual-level predispositions such as political attentiveness or interest. In positing his gateway hypothesis, Baum (2003) theorized that exposure to content on a given issue in political entertainment programming will enhance interest in and consumption of additional news about this issue in traditional news. Studies undergirded by the gateway hypothesis assume that some viewers may be drawn to this type of content as a result of political interest, while others may select it more for entertainment value, creating an opportunity for incidental effects. Survey data from 2002 and 2004 support this assumption, at least for programs such as *The Daily Show*: A nontrivial proportion of that program’s viewers registered moderate to low levels of interest in politics (Cao, 2010).

The variance in political interest among political entertainment viewers has been leveraged into methodologically diverse research that speaks indirectly to media effects on political behavior. Both surveys and experiments document a process in which viewers with lower levels of attentiveness or political interest can experience unique gains in political attentiveness and learning relative to the already-savvy viewers who share their taste in television. Although the precise mechanisms of these effects remain somewhat unclear, most related research in this area tends to assume that politics wrapped in an amusing package simply makes engagement with political information more appealing and/or less taxing for those without a strong preexisting interest in politics (Cao, 2010; Parkin, 2010; Xenos & Becker, 2010). And if political interest is linked to political activity, then those with initially low levels of interest would become more participatory. Not all studies find differential patterns of

association that run in this direction, however. In an early study of exposure to late night comedy and daytime talk show programs during the 2000 presidential race, Moy et al. (2005) found that among viewers who were highly interested in politics, a significantly greater association existed between exposure and political activities such as voting and political discussion. That is, viewing political entertainment enhanced the likelihood of engaging in politics among those already predisposed to do so.

Taken together, this corpus of literature clearly identifies some potential for positive associations between viewing political entertainment content and behaviors that reflect engaged citizenship. But it is also clear that work in this area has found increasingly more contingent effects that require continued theorizing, and that scholars should not treat this particular genre of media content as a unitary phenomenon (Mazzoleni & Sfardini, 2009). Ultimately, with greater and greater blurring of the traditional boundaries between news and entertainment, such research will be increasingly important to address the changing media landscape.

Conclusions

For decades, political communication scholars have sought to better understand the various impacts of mediated communication on political behaviors that constitute the essence of democratic citizenship. Efforts that explore media effects on political and civic behaviors in their numerous manifestations have yielded a substantial set of insights. And, these insights continue to evolve. Research has documented a generally positive relationship between consumption of, or attention to, mass-mediated public affairs content and participatory behaviors. Over time, this work has come to identify the many ways in which these relationships may vary based on audience member characteristics (e.g., their level of political efficacy, their need to survey the political environment, and the extent to which they deeply process the information consumed) and/or the modes and types of communication in question.

The shift toward nuanced and sometimes highly differentiated findings stems from the set of dramatic changes in the mass media environment (and correspondingly, the mass media audience) over the past half-century. Notions of a mass audience began as one served by a relatively simple (broadcast) communications system. However, with the growth of cable television and web-based technologies, this general notion has given way to a complex mosaic of systems infused with a rich digital infrastructure. These technological changes present scholars of media effects and political communication with a target that is not only moving, but also morphing and multiplying.

As Bennett and Iyengar (2008) contended, this stratamentation has serious implications concerning the very core of how scholars think about media effects research. As numerous strands of inquiry have shown, individuals today rarely sit down to see what is on television as so many did in earlier eras. Rather, they are increasingly apt

to select a specific news broadcast precisely because they expect it to provide a particular set of ideological frames, or view a comedy program as a direct function of their preference for such content over news (Iyengar & Hahn, 2009). In other words, gone is the assumption that news content, or any other programming, can be treated as relatively independent of an individual's consumption of, or attentiveness to, that content. Stratamentation similarly complicates the intuitive approach of related experimental research in which participants are randomly assigned to view one frame or another, or a comedic versus a serious treatment of a given issue. Though others are not as convinced of the seriousness of these implications (Holbert, Garrett, & Gleason, 2010), it is clear that stratamentation poses serious issues for media effects, in particular, media effects research focused on democratic citizenship.

Theoretical and methodological issues of endogeneity notwithstanding, it is worth identifying a number of substantive issues related to the fragmentation of mass media and the mass audience. As much as social and technological changes bedevil clear thinking about media effects as traditionally understood, they are implicated in a number of other patterns closely related to the collection of outcome variables we have focused on in this chapter. These issues and patterns lead the way toward fruitful areas of new research on the relationships between political communication and democratic citizenship.

The first deals with "infotainment" or political comedy programming, and how its unique properties may create an exception to the patterns typically associated with stratamentation. To explain, at the crux of most discussions of fragmentation is the notion of perfect (or at least increasingly perfect) media filtering. As Prior (2007) argued, an abundance of media choice has created a world in which it is easy for entertainment seekers to consume only frivolity and for political junkies to be exposed only to hard news. In other words, audience members can now efficiently translate their content preferences into personalized consumption. However, as noted by Holbert et al. (2010) and conceded somewhat by Bennett and Iyengar (2010), politically oriented entertainment programming is hybrid in nature, satisfying both news and entertainment preferences. As such, the mix of entertainment and information provided by programs such as *The Daily Show* or politically themed skits on *Saturday Night Live* works mischief with the notion of perfect filtering. This is demonstrated by the research on "gateway" effects reviewed earlier, including how entertainment-seekers receive political information and cues as a side effect of watching political comedy. At a minimum, such examples identify a safe harbor in which traditional conceptions of incidental exposure and media effects may continue to make sense. At a more general level, however, they serve to remind us that perfectly homogenized niche audiences may not be the only or inevitable outcome of media fragmentation.

A second issue that will clearly figure prominently in future research is how fragmentation has been occurring not only in terms of media content preferences, but also along ideological or partisan dimensions. The latter both threatens and offers opportunities for central aspects of democratic engagement. On the one hand,

ideological and partisan fragmentation poses serious threats to deliberation at the aggregate level. As many citizens occupy smaller and smaller niches, the groups to which they belong and identify may simply talk more and more past each other. Opportunities for true deliberation may be reduced to the enclave level, where the chances of civil encounters with those who hold opposing views are minimal (Sunstein, 2001). More informal interpersonal political discussion may be equally threatened. On the other hand, there is an inherent tension between deliberative engagement and more action-oriented participatory behaviors. The normative assumption behind deliberation, one that is borne out empirically, is that deliberation can enhance levels of political participation (Jacobs, Cook, & Delli Carpini, 2009). Yet as much as “hearing the other side” may delight deliberative theorists, it also is associated with less, rather than more, of other core forms of political activity such as voting (Mutz, 2006). As with any growing body of research, empirical inconsistencies may stem from different theoretical, methodological, and operational perspectives that themselves may be grounded in differing normative assumptions. Although existing efforts have provided key insights into these dynamics, it is clear that additional research into the full implications of ideological and partisan fragmentation for democratic engagement will be necessary for some time into the future.

Last but not least, understanding media effects on democratic citizenship requires a clear delineation of what constitutes meaningful political engagement. Just as recent years have witnessed an exponentiation of media forms, content, and channels, as well as the many communications patterns associated with these changes, there is an expanding menu of ways to participate. Citizens’ engagement in both vertical and horizontal interactions can now manifest online and offline. Citizens can now engage in political talk, not only through face-to-face encounters, but also via mobile telephony and a myriad of computer-mediated venues. Moreover, with the advent of Web 2.0 technologies, citizens can increasingly provide political information and commentary to other citizens, loosening the monopoly on such communication previously enjoyed by a limited field of “professional communicators” (Page, 1996; Xenos & Kim, 2008). Today, the ease with which citizens can communicate and take action online – from emailing to paying bills to donating to a campaign – suggests that voting may no longer reflect the entry-level stage of involvement that Crotty (1991) believed.

In addition to posing a variety of basic questions about what *counts* as a useful political engagement variable, broader trends related to these shifting modes of citizen engagement have drawn attention to how conceptions of citizenship may shift over time as well. In particular, contemporary youth are abandoning traditional models of citizen engagement in which a strong sense of duty motivates largely institutionally structured participation and engagement. Instead, they are favoring more individualized politics that involve self-actualization and personal growth (Bennett, 2008). That young adults are also the ones turning to the web and staying connected is not insignificant, particularly as technology has bestowed upon society a 24/7 news cycle and traditional print and broadcast forms of news have melded.

Moreover, younger citizens are the ones to turn media consumption into media production. It is clear then that future scholarship will be unable to abandon fundamental normative discussion about what it means to participate and be a good citizen.

In conclusion, while political communications scholars have undoubtedly amassed a significant collection of insights into how media affect democratic citizenship and civic engagement, it is clear that unanswered empirical and normative questions remain. At each end of our most familiar equations, key players and concepts are in flux. Moreover, sociotechnical changes are calling the very form of those equations into question. What remains constant, however, is the importance of understanding the mechanisms and processes by which citizens interact with media and each other in order to learn about political issues, form opinions, and act in ways that communicate their preferences.

Exploring Relations between Political Entertainment Media and Traditional Political Communication Information Outlets

A Research Agenda

R. Lance Holbert and Dannagal Goldthwaite Young

ABSTRACT

A wide range of entertainment media content has been shown to influence some of our most important democratic outcomes. In addition, political communication scholarship is beginning to look at how certain entertainment-based media outlets function alongside more traditional political outlets (e.g., TV news, debates). In today's complex media environment, it is apparent that audience members do not experience entertainment media or news in complete isolation. There is *hybridity* across individuals, across genres, and across texts. Studying how various forms of political information work together, and how people make sense of them in tandem, is essential to understanding the broader role of media in politics. This chapter offers a plan of action designed to allow political communication researchers to engage in a theoretically grounded, systematic study of how entertainment media relates to, informs, and interacts with more traditional public affairs media within the context of politics.

The Rise of Political Entertainment

The study of political entertainment media has grown exponentially in recent years (e.g., Baumgartner & Morris, 2008). Political communication scholars studying media influence historically did so solely in the context of news (e.g., Bennett & Iyengar, 2008). But more recently, scholars have begun to recognize and stress the importance of entertainment content as an agent of political influence as well (see Holbert, Garrett, & Gleason, 2010). Among the kinds of political entertainment that have garnered scholarly attention are: late night talk shows (e.g., *The Late Show with David Letterman* or *The Tonight Show with Jay Leno*), daytime talk shows (e.g., Oprah), political satire programs (e.g., *The Daily Show with Jon Stewart*, *The Colbert Report*), entertainment-oriented news programs (e.g., *Entertainment Tonight*), situation comedies (e.g., *The Simpsons*; see Cantor, 1999), as well as dramatic TV programming (e.g., *Law & Order*; Holbrook & Hill, 2005). These diverse forms of political entertainment media have been shown to impact the full range of the hierarchy of effects, from salience (e.g., relative importance of a political issue; see Young, 2006), to knowledge (e.g., knowing the number of US troops deployed to Iraq; see Baum, 2003), to attitudes (e.g., feeling thermometer rating of President George W. Bush; see Holbert et al., 2003a), to behaviors (e.g., voting; see Cao & Brewer, 2008). It is clear from this empirical research that political entertainment content has the ability to generate democratic influences.

In spite of the abundance of confirmatory evidence in this arena, the study of the effects of political entertainment continues to lack a systematic approach, a cohesive theoretical perspective (Holbert, 2005), and an acknowledgement of broad historical, political and technological shifts underlying the growing phenomenon. The pages that follow will explicate the advances made in this emerging area of research – across studies of content, audiences, and effects. But more importantly, this chapter will identify ways in which each of these areas of study might better contribute to the broader conversation concerning political entertainment's role in today's political world. Areas of promise across the field are identified and the benefits of subtle, complex theoretical approaches are explored. Finally, the chapter articulates the imperative need for scholars in this domain to allow historical context to inform their models of media effects, and to work across epistemological traditions to capitalize on the wealth of insights emerging from our colleagues in more humanistic traditions.

In the Message is the Mechanism: The Importance of Content

Scholars have begun to systematically quantify the content within and across political entertainment programming. In fact, content analyses of some of the more popular

(and hence potentially influential) political satire programs (e.g., *The Daily Show*) have revealed important patterns and contrasts in theme and substance. Research by Fox, Koloen, and Sahin (2007) suggests that *The Daily Show* provides political information as substantive as the nightly broadcast television news programs found on the major US television networks. A recent content analysis of the same program by the Pew Research Center's Project for Excellence in Journalism finds that Jon Stewart's content is akin to that of a cable TV news program, with a focus on national politics, the press, and purposefully selected news items from the day (see <http://www.journalism.org/node/10953>). Such analyses will help effects scholars explicate the mechanisms that account for the various levels of impact of these programs, which, in the absence of such content analyses, would be left to mere speculation. One realm in which the importance of content analytical approaches has become apparent in the development of effects mechanisms is in the study of late night political jokes (see also Chapter 14). Studies exploring patterns in themes, targets, and topics across various late night comedy programs (Niven, Lichter, & Amundson, 2003) have aided in the development of fruitful theoretical mechanisms of cognitive effects of late night political jokes (Young, 2006).

It is interesting to note, however, that the subtleties in content and theme even within subgenres of political entertainment (e.g., late night political humor) render this task complicated, but increasingly necessary. For example, while a number of studies examine the effects of "humor" on a range of political outcomes (e.g., Nabi, Moyer-Gusé, & Byrne, 2008), it has become clear that there are several different types of political humor (e.g., satire, sarcasm, irony) and hence, to treat humor as monolithic is problematic, both conceptually and empirically (Hmielowski, Holbert, Jain, Lather, & Morey, 2011a). One necessary element to a theoretically driven effects paradigm in the context of political entertainment would involve large and systematic content analyses within and across political entertainment genres. For example, Baum's (2003) content analytical work on the nature of coverage of foreign crises on "soft news" programs offered useful and widely cited insights on the breadth and depth of political entertainment's treatment of issues like war. Such work is needed in other avenues of our political entertainment landscape to begin to develop the systematic approach alluded to at the outset.

Beyond the world of quantitative content analyses, the humanistic traditions have made great strides in advancing a conversation about the content of political entertainment. Cantor (1999), for instance, argues that the political messages offered on a show like *The Simpsons* exist on multiple levels. The first level consists of explicit and concise explicitly satirical political arguments. These statements are often memorable for audience members, but come and go rather quickly. On a recent episode of *Family Guy*, for example, two of the main characters find themselves back in time in Nazi-occupied Poland. While there, they observe that one of the Nazi soldiers is wearing a McCain-Palin political button on his lapel (see <http://www.youtube.com/watch?v=AIWTB8POnkg>). These bits of content offer explicitly valenced political arguments (e.g., that McCain-Palin supporters are closeted Nazis). However, Cantor

argues that the more subtle, and potentially more profound, political influence of a show like *The Simpsons* rests elsewhere. For example, *The Simpsons* places all public policy and political issues in the context of the nuclear family (i.e., how the traditional family is impacted by these issues). It is this broader frame through which politics is presented that Gamson (1999) defines as “lifeworld content.” Such subtle and diffuse meta-narratives are inherently tied to the genre of entertainment, and may prove to have longer-lasting effects on a citizenry than more traditional political information like news.

As long argued by scholars in the critical-cultural tradition, the political importance of popular entertainment rests in the many nuanced political messages that reside within and across texts (e.g., Press & Cole, 1999). These political messages can be linked to such public policy issues as gay rights, women’s rights, abortion, and the environment (to name just a few examples; see Holbert, Shah, & Kwak, 2003b). Indeed, many of the assertions advanced by critical-cultural scholars have received empirical validation. As Holbert et al. (2003b) have stated, “many of the relationships suggested by these scholars appear to have measureable consequences” (p. 58). In short, there are many rich insights offered by critical-cultural scholars that can translate over to the offering of empirical questions that could provide understanding about a wide range of effects of political entertainment media content (see Condit, 1990 in relation to Holbert et al., 2003b).

Nowhere is this previous point better illustrated than in recent humanistic-oriented work on some of our most popular political entertainment programming, *The Daily Show* and *The Colbert Report* (Gray, Jones, & Thompson, 2009). Baym (2005, 2009) argues that *The Daily Show* represents a new style of journalism and that elements of *The Colbert Report* mix together basic elements of play that are central to entertainment with factual information that is more traditionally found in news. While many scholars see the content and form of these shows as accessible and hence democratizing (Jones, 2009), not all scholars agree. Hart and Hartelius (2007), for example, argue that the nature of the political messages being offered on *The Daily Show* can inspire greater cynicism within young voters, a cohort already highly skeptical of politics in general. There is some empirical support to back up this claim (e.g., Baumgartner & Morris, 2006), but the nature of these effects as normatively positive versus negative is still very much in debate (Young, 2007).

The Who: The People Watching “The What”

Beyond the currently fragmented study of content and effects, the study of political entertainment would benefit from expanded and detailed analyses of the audience: *Who* is watching these programs? *Why* they are watching? And *how* do the characteristics of these viewers affect the extent to which they are affected by the viewing experience? Young and Tisinger (2006) offer the most systematic secondary analysis

(using both Pew and NAES data) of what best predicts exposure to programs like *The Daily Show* and *Saturday Night Live*. Their findings suggest that younger people, and those listening to talk radio and consuming news online, are more likely to watch such political humor programming. In spite of these findings, the authors are only able to account for 14% of the variance in late night TV viewing among those who have a stated preference for *The Daily Show*. Clearly, there is much more we as political communication scholars need to do to better understand who is consuming this material and why.

A more recent study by Hmielowski, Holbert, and Lee (2011b), using statewide primary survey data, has been able to account for 50.7% of the variance in audience exposure to TV political satire (i.e., *The Daily Show* and *The Colbert Report*). The authors found that a parsed multiple-regression equation using only four predictor variables was able to account for *almost half* (48%) of the variance in exposure to televised political satire. Those four variables were: age (negative predictor), liberal cable TV exposure (positive predictor, i.e., MSNBC programming), satirical situation comedy exposure (positive predictor, i.e., *The Simpsons*, *Family Guy*), and affinity for political humor (positive predictor). The latter of these predictors, *affinity for political humor*, is a newly explicated individual-level audience characteristic designed to predict one's engagement with different kinds of political entertainment. Such innovative techniques illustrate the kind of subtle constructs that will prove useful to scholars studying political entertainment audiences in the future.

In addition to satisfying our mere curiosity regarding who is watching and why, capturing some of these individual-level audience characteristics has proved particularly beneficial to the development of theoretical mechanisms accounting for political entertainment's influence. Traditional political constructs like political knowledge, interest, and efficacy have been found to shape the extent to which viewers are affected by political entertainment in terms of various political outcomes including construct salience (Young, 2006), attitudes toward candidates (Baum, 2003), perceptions of news (Holbert, Lambe, Dudo, & Carlton, 2007), information seeking (Xenos & Becker, 2009), and participation (Cao & Brewer, 2008). Thus, the effects of political entertainment depend in part on prior levels of political knowledge, interest, and efficacy.

More subtle moderating effects are beginning to emerge through the study of both content and audience. For example, highlighting the complementary and reciprocal influence of political satire on perceptions of news (and *vice versa*), Holbert et al. (2007) illustrated that the effects of viewing political satire on viewers' perceptions of news was contingent on the order in which these programs were viewed. Much of this work has assessed the role of audience characteristics in shaping short-term outcomes (e.g., Cao, 2006). The next step involves expanding the subtle psychological and contextual constructs that shape how and to what extent political entertainment-based media effects unfold over time (e.g., transportation – i.e., the degree someone becomes consumed within a narrative; cue discounting – i.e., discarding of heuristics; cognitive elaboration; affect; political orientation like ideology or party identification).

Understanding how different kinds of people are affected by media content is not a goal unique to media effects scholars. Understanding how different kinds of people derive different meanings from media texts has also been a goal – albeit with a very different rhetorical frame – of those in the humanistic traditions for decades. As argued by cultural scholars (see Jones, 2010) the construct of the passive “audience members” ought to be reconceptualized as active participants in the consumption of political content. As scholars like Jones (2010) and Van Zoonen (2005) suggest, the act of consuming political information is a participatory act. “For better or worse,” argues Jones, “the most common and frequent form of political activity – its actual practice – comes, for most people, through their choosing, attending to, processing, and engaging a myriad of media texts about the formal political process of government and political institutions . . . ” (p. 23). In these terms, viewers are participating in the deconstruction and reconstruction of messages to create their own political understandings. Indeed, as illustrated in the concept of polysemy, media scholars have long argued that popular entertainment’s political influence resides in the multiplicity of political meanings that coexist within a single text. Hence, the role of viewer message construction is paramount. While the individual act of “decoding” mass media texts has its roots in this critical cultural tradition, empirical studies of the “conditional effects” of media messages continue to illustrate the importance of “message deconstruction” in shaping the outcomes experienced by different viewers. In other words, both research traditions have recognized the potential for different audience members to respond differently to the same media text.

The implications of viewers’ active construction of political meaning is well-illustrated by the popular satirical comedy program, *The Colbert Report*. A recent study by Baumgartner and Morris (2008) found that the effects of this program may not be as intended by the show’s creators. *The Colbert Report* is a satirical representation of a conservative political talk show (e.g., *The O’Reilly Factor*). The show’s host, Stephen Colbert, takes on the role of ultra-conservative talk show host throughout the program and never breaks from this ironic style of presentation. Baumgartner and Morris find that this style of presentation may lead viewers to retain more positive attitudes toward political conservatives, hence suggesting that the audience does not recognize the true intent of the satirical messages within the show. Another study by LaMarre, Landreville, and Beam (2009) found that liberals and conservatives perceived the content of the *Colbert Report* as equally funny, but for very different reasons. Liberals found the show funny because of the way in which conservative commentators were being mocked, while conservatives found the show funny for the way in which Colbert was making fun of liberals. The former group embraced the show for its intended purpose of being a satirization of conservative talk shows, while the latter group embraced a more literal translation of the program. In the end, both groups were able to find what they wanted to find in the program, indicating that these types of biased processing effects need to be taken into account in the study of political entertainment effects (see also Vidmar & Rokeach, 1974).

Even the creators of political entertainment seem to understand that, unlike the often strategic political discourse offered in the traditional elite-dominated “political spectacle” (Edelman, 1988), in the world of polysemic political entertainment, viewers construct or discover diverse political meanings within a single text. Jason Reitman, director of such acclaimed politically-themed films as *Juno* and *Thank You for Smoking*, has observed that both the ideological right and ideological left perceive his films as supporting their *own* viewpoint. It is the nuanced and complex nature of entertainment that allows for this multitude of interpretations (Moyer-Gusé, 2007). And, it is in these complexities and multitudes that the importance of political entertainment effects rest – albeit with new and complex methodological challenges.

Effects Mechanisms: Areas of Promise

We have firm empirical evidence that a variety of political entertainment messages can produce a wide range of democratic outcomes (see Chapter 21). However, the study of political entertainment effects has been fragmented and lacking in coherent theoretical approaches. A few of the most promising areas of research have, as recommended in earlier sections, integrated systematic analyses of programming content and audiences (or consumers), and have explicated subtle theoretical mechanisms, including interactive effects based on audience characteristics. This kind of approach is thriving in the study of political humor, for instance, as researchers have sought to categorize and quantify the content of political humor, satire, and irony, and develop micro-level information processing mechanisms to account for political effects within and across humor type (Nabi, Moyer-Gusé, & Byrne, 2008).

Another promising area of effects research has approached the study of fiction and narrative. Here, scholars have empirically defined what constitutes “narrative” compared to non-narrative content and have developed the concept of “transportation into a narrative world” to refer to the experience of being absorbed into a given story. Scholars are recognizing that the process of transportation may account for narrative’s ability to affect cognitive processing and attitude change (Green & Brock, 2000). This exploration of the unique influence of fictional content has suggested that fiction may be categorized quite differently in the brain, and hence be subject to less scrutiny than non-fictional messages (Wheeler, Green, & Brock, 1999), a conclusion that has profound implications for the study of fictional or narrative style political entertainment from *The West Wing* to medical and crime dramas, to fictional films about politics or war.

Finally, we turn to the promising work by scholars integrating the seemingly incongruous worlds of emotion and information processing. For decades, the separation of news and entertainment was steeped in the notion that the former was rational and the latter emotional (see Delli Carpini & Williams, 2001). Just as the boundaries between these two genres have eroded, so too have the boundaries

between the study of emotion and reason in political communication (Neuman, Marcus, Crigler, & MacKuen, 2007). Indeed, the broader discipline of media effects has produced extensive evidence confirming the usefulness of integrating the study of emotion into information-processing mechanisms of mass communication effects (e.g., Nabi, 1999). According to this research, emotions like fear, guilt, and more recently, anger (Moons & Mackie, 2007) have the ability to inform how viewers categorize and cognitively process media messages. Given the abundance of evidence in this burgeoning field and the intimate relationship between entertainment and emotion (Tannenbaum, 1980), we urge scholars to seek to integrate this emerging theoretical perspective into the systematic study of the content, audiences, and mechanisms responsible for democratic outcomes – across and within political entertainment genres.

Hybridity

Political communication scholars in more humanistic traditions often emphasize the notion that the influence of political information in myriad forms is diverse, omnipresent, complex, and subtle. In spite of this, political media effects scholars to date continue to examine the most overt political outcomes (e.g., voting, favorability of political candidates, political knowledge) and the most overt political forms of entertainment (e.g., *The Daily Show*, *The West Wing*, *The Colbert Report*), but without attention to the subtleties or complexities underlying the phenomenon as a whole. This is not surprising, nor is it particularly worthy of scorn, *per se*. More often when a new area of study gains traction, as the empirical study of political entertainment has over the last decade, scholars first offer a series of novel or interesting effects and various strands of disparate research agendas. Over time, the body of work created through these disparate approaches comes to reveal trends, themes, and – important to our conversation here – important gaps.

One issue that falls into this latter category – gaps in the research agenda – concerns how political entertainment media relate to more traditional political communication information outlets, like news, in the generation of processes of effects (Holbert et al., 2007). Far too many scholars (including the authors of this chapter on occasion) have adopted a competitive framework in looking at the role of entertainment *versus* news relative to a host of democratic outcomes (e.g., Prior, 2005): Which increases political knowledge more? Which is more “substantive?” Which encourages more political engagement? This competitive framework has been counterproductive, as it seems to fundamentally misunderstand – and empirically misrepresent – our ever-evolving political media landscape. Instead, we must understand *how all forms of political content function in coordination with one another* in the production of a range of media effects. As Chaffee (1986) argued long ago, communication breeds more communication. It is here in these complementary dynamics that we

will find an accurate representation of how our citizens interact with their political worlds (see Holbert & Benoit, 2009). Such an approach will illuminate the evolutionary dynamics of the variety of political messages in the new media landscape, hence facilitating a broader, more systematic understanding of the role of media in politics.

Indeed, the audience does not interact with entertainment and news as distinct or competing genres. The people who consume political entertainment *are* the people consuming “traditional” political entertainment (Hmielowski et al., 2011b; Young & Tisinger, 2006). The unique addition of Baum’s “gateway hypothesis” (2003) to the body of political entertainment scholarship has shown the advantages of effects models that emphasize the complementary worlds of political entertainment and news. Several studies have confirmed the utility of such a hybrid approach, revealing that political entertainment content can serve as a “gateway,” leading to greater consumption of news content (Baum, 2003; Xenos & Becker, 2009; Chapter 21, this volume). In short, the limited evidence amassed to date points to entertainment and news functioning together in relation to the citizenry.

In spite of these early forays into the hybrid world of political media effects, as a discipline, we have yet to address what this complementary dynamic means for the study of media’s political influence. To develop such a framework, effects scholars must first contextualize their orientation to the study of political entertainment effects in the historical, economic, and technological roots of this hybrid phenomenon. Just as a keen understanding of the content and audience of political entertainment has informed the development of important effects mechanisms to date, so too must these larger issues of history, economics, and technology begin to inform the development of effects models across the hybrid media landscape.

Causes and Characteristics of Hybrid Political Media Environment

Much of the conceptual work underlying this discussion comes to us from scholars of culture, who, through observation, case study, and historical analysis, have begun to articulate the characteristics and causes of the emergent hybrid political entertainment landscape. Work by numerous prominent scholars in this area (Baym, 2009; Delli Carpini & Williams, 2001; Gray, Jones, & Thompson, 2009; Jones, 2010), has successfully framed the discussion of political entertainment in terms of the economic, cultural, and technological transformations that lead to the hybrid political entertainment environment we know today. We summarize this discussion to provide effects scholars with the necessary introduction to begin to think more broadly about the very patterns of effects they seek to understand.

The hybrid media environment we find ourselves immersed in today is a sharp contrast from that to which citizens turned even two short decades ago. The obvious

difference is the profusion of media options made available in the digital media environment, and the decline in the popularity – and hence power – of the once dominant big three networks (ABC, CBS, and NBC). Yet, as explicated by Delli Carpini and Williams (2001) and Baym (2009), this shift goes far beyond the simple increase in media options experienced by the average citizen. Throughout the bulk of the twentieth century, the dominant perspective of the political world was founded on a strict separation between elites and the masses, and, correspondingly between news and entertainment. This tradition, borne out of social scientific approaches to the study of individual and crowd behavior (LeBon, 1896; Lippmann, 1922) emphasized the need for people to be organized and governed by elites, or “experts,” as Lippmann argued, lest they become victims of whimsy or other dangerous forces, fears that many saw confirmed by the rise of the Nazi party in Germany during the 1930s.

The notion that the masses needed to be protected and instructed also shaped the nature of journalism throughout the century. Journalism became a profession, governed by “institutional structures and processes” (Delli Carpini & Williams, 2001, p. 165) concerning the strict division between opinion and “fact” and between news and entertainment, as well as protective mechanisms designed to limit the influence of money on the production and content of news itself (Schudson, 1998). Throughout television’s first decades in the home, scarcity of resources and broadcast spectra, as well as the prohibitive cost to produce and air television content led to the concentration of broadcast power in the hands of just a few large networks. What accompanied this focused concentration of power was a stable hierarchy separating the news producers, on the one hand, from news consumers, on the other. It also facilitated a standardization in news formats and governing principles, including the implicit understanding across the networks that “network newswriters [. . . were] in the business of public information, a distinct enterprise from the networks’ wider profit-seeking strategies” (Baym, 2009, p. 11). Scholars argue that such policies “protected” journalism from the pressures of audience “wants,” leaving news decisions framed instead in terms of audience “needs” (Baym, 2009); hence reifying the news/entertainment distinction on yet another level.

Through a complex and rapid set of concurrent transformations starting in the late 1980s, however, these seemingly fixed guidelines and definitions quickly began to break down. Chief among them were the policies of the media deregulation of the 1980s, which extended into the late 1990s, as well as the simultaneous advances in digital communication technologies including cable and the Internet. Deregulation that began in the 1980s had far-reaching implications for the nature of media industries as a whole (Bagdikian, 1992), leading to increased consolidation of ownership among media conglomerates. With the Telecommunications Act of 1996, the expansion of media monopolies snowballed, the protected class of public affairs programming was rendered obsolete, and news programming that had otherwise been protected from economic pressures found itself squeezed for ratings and revenue (McChesney, 1999). As argued by Delli, Carpini, and Williams (2001), this process of

increased centralization of ownership “into a handful of international communications conglomerates with interests in film, music, cable, and broadcast television increases the pressure for profit and further blurs the line between news and entertainment” (p. 166).

This blurring of lines between news and entertainment and between what people need and what people want was simultaneously nourished by technological advances in cable and digital technologies. With a proliferation of channels and modes of access not bounded by time or space, media conglomerates began to acquire holdings across genres and platforms. Meanwhile, because digital media are decentralized by design, it soon became clear that their power and influence would be difficult to harness, hence mitigating the impact of the once-powerful mass media gatekeepers (see Baym, 2009). The migration of control over political information away from political elites increasingly challenged their already waning political authority (Delli Carpini & Williams, 2001) and began to allow for other voices and genres to emerge as popular and legitimate sources of political information and understanding (Jones, 2010).

We argue that it is imperative that political entertainment effects scholars understand this historical perspective and allow it to inform their work. The existence of the political entertainment genre that we study today is inherently tied to the “post-network era” because the very transformations (in policy and technologies) that eroded the networks’ centralized authority, gave rise to the hybrid political entertainment landscape in the first place. As a result, an important synergy exists between declining network or journalistic authority on the one hand, and the rising authority of alternative voices and genres on the other. These concurrent shifts have invited – even encouraged – citizens to construct political meaning through multiple (if not infinite) channels, a phenomenon that was richly documented in the work of Delli Carpini and Williams dating back to 1994. Fortunately, there is increasing acknowledgment among scholars, journalists, and elites, that people *are* actively constructing meaning from these varied sources. At the same time, at least among cultural scholars, there is a salient recognition that none of these programs or genres exist in isolation from the others (see Gray, Jones, & Thompson, 2010).

And so, we return to our aforementioned call for effects scholars to take into account the complementary relationship between mass-mediated political texts. We do so, however, not simply because individuals are consuming various forms of political information (Hmielowski et al., 2011b; Young & Tisinger, 2006), but because political content across the spectrum of mediated political information is by and large *symbiotic*. News programs adopt entertainment norms to meet growing demands for profit (Hickey, 1998) and increasingly report on political entertainment programming and its effects as news (Feldman, 2007). Meanwhile, overtly political entertainment programs (like *The Daily Show* or *Real Time with Bill Maher*) make explicit use of political “news” both in the coverage of political events and in the deconstruction of norms governing politics and news (Baym, 2003; Jones, 2010; Young, 2007). In addition, entertainment programming at large incorporates political topics, events,

narratives, and themes (Van Zoonen, 2005). Jones (2010) and Van Zoonen (2005) are among the growing number of scholars who highlight how such entertainment engages subtle political themes in a manner consistent with how ordinary citizens think about politics. By tapping into political themes through anecdote, emotion, humor, and narrative, such programming may “enable a closure of the estrangement between politics and citizens” (Van Zoonen, 2005, p. 7).

Increasingly, scholars are suggesting that the integration of politics into entertainment programming is far from accidental. Such hybridity in content may be a response to the traditionally symbiotic relationship between the press and politicians (Young, 2007) or to the traditionally elite-dominated political culture of the past (Van Zoonen, 2005). Indeed, Edelman’s (1988) *Constructing the Political Spectacle* suggests art – and perhaps by extension, entertainment – can serve as a *counterdiscourse*, or remedy, to the political theater that dominates mainstream political culture. Outside of the political world dominated by elites, entertainment might allow more people into the world of political meaning and understanding. By reframing politics into an accessible language of anecdote and emotion, political entertainment might help further shift ownership of “political meanings” away from elites to citizens (see Jones, 2010; Van Zoonen, 2005).

Conclusion: A Bright Future for Effects Research

From an empirical standpoint, the question is “Why do these observations matter?” and “What do we do with them?” Unfortunately, for quantitative media-effects scholars working in the domain of political entertainment, these observations complicate traditional effects models that dominate our work to date. However, rather than embracing a new paradigm of “minimal effects” (e.g., Bennett & Iyengar, 2008, 2010), we believe these observations open a door to a multitude of rich and fruitful areas of effects mechanisms to pursue.

Consider, for example, the empirical implications of the following observations of critical-cultural scholars: Jones et al. (2010) state, “Texts do not take on meaning for any reader in a vacuum. Rather, a reader will always make sense of texts relative to other texts, ‘socially’ or ‘intertextually.’” (p. 18). The concept of “intertextuality” speaks of the need to understand how engagement of politically-oriented entertainment content functions *alongside* the various types of more news-oriented messages audience members are consuming. *The Daily Show* does not function in a vacuum relative to news. In fact, *The Daily Show* only exists because of the news (Baym, 2005). In addition, we know that those who are engaging with *The Daily Show* are knowledgeable about politics and consume various forms of traditional news material. In terms of how readers make sense of texts “socially,” it is clear that a wide range of social events (e.g., war, economic distress, electioneering) serve to shape how we react to entertainment content with political themes. In fact, even what we deem to

be “political” changes as a function of social, cultural, and temporal context. How we come to define any one message as “political” or “nonpolitical” is determined in large part by macro-level factors and the individual’s perceptions of and experience with those factors – both of which are inherently shaped by social influences. And so, we see that understanding these *social* and *intertextual* processes of media effects is essential to capturing the complex reality of effects in the hybrid media environment. This is rich ground from which to generate multiple lines of media effects research, much of which will require scholars to work across several levels of analysis.

Also speaking of the *social* and *intertextual* nature of the new media experience, Jenkins (2006) stresses that, “Convergence represents a cultural shift as consumers are encouraged to seek out new information and make connections among dispersed media content . . . Convergence occurs within the brains of individual consumers and through their social interactions with others.” (p. 3–4). The notion that people make connections between “dispersed media content” is essential. In this new media environment, a young voter in the 2008 election who is in search of political meaning and understanding will almost certainly craft links between dispersed media content as varied as: Obama’s now historic March 18, 2008 speech on race given in Philadelphia, *The Simpsons* episode in which one of Homer’s best friends, a character of African-American descent, becomes his boss, user-generated content on YouTube that expresses individual reactions to the Obama speech, or a documentary film by Neo-Nazis promoting White supremacy. It is the meaning constructed at the crossroads of these pieces of content (and influenced by the preexisting mental models brought to the various media experiences) that will influence how this person will come to think about multiple-attitude objects, ranging from race relations in the United States, to the president, to the prospect of having an African American chief executive. Ultimately each of these perceptions informs this person’s political behaviors as well as other attitudes that extend far beyond the immediate issues at hand.

Jenkins’ (2006) and Jones’ (2010) emphasis on the social nature of new media experiences will become even more relevant as our digital media environment continues to evolve (and with it the nature of our political messages). In the era of blogs, Facebook, and email, citizens no longer consume a newspaper article, magazine exposé, talk radio show, or hour-long television drama in relative isolation. Our consumption of media (no matter what form) is – and will increasingly become – a social act. As Plato stated long ago, we are political beings because we are social beings. Our media have become more social, and, by default, have also become more political. The complexity of connections we, as political and social beings, make will increasingly determine the makeup and feel of our own political identities.

Such observations explicitly denounce the notion that the influence of political entertainment can be found in individual messages alone. If “texts do not take on meaning in a vacuum,” then we seem to face the daunting task of assessing the impact of the landscape as a whole. Yet, when explicated in concrete operational terms, this seemingly impossible task of assessing media impact in light of *intertext-*

tuality, becomes a thoughtful and manageable exercise – one that will likely lead scholars to some novel and profound avenues of research. The methodological challenge for media effects scholars is clear: Running experiments or conducting surveys at this social and intertextual *crossroads* is a messy business. Nevertheless, we must continue to challenge ourselves to conduct our research where it will generate the greatest utility and insights. To date, the study of entertainment media and politics has excelled at picking the lowest hanging fruit, but it's time to get out the ladder and begin to seek out that fruit which is most ripe.

We would like to stress that the insights offered by our critical-cultural peers need not be seen as orthogonal to basic social scientific theory. Take for example the advice offered by Jones (2010): Scholars ought to, “. . . be aware of the multivocality of media texts, as well as attempt to understand the complex readings and relations that audiences make and have with television, including their abilities to negotiate, appropriate, employ, and appreciate many different types of programming forms that include politics” (p. 15). Consider this observation in light of the tenets of one of our most basic theories of persuasion, the elaboration likelihood model (ELM). Petty and Cacioppo's theory (1986) emphasizes the importance of the cognitive activity of the message recipient, stressing how a message's persuasive power functions in large part due to the motivation and ability levels of the message recipient (or deconstructor). Jones' observation urges scholars to consider the myriad of motivations and abilities audiences bring to the political entertainment media experience. Here, he is suggesting that these individual motivations and abilities shape how message consumers deconstruct and reconstruct the meaning within political content. In the language of media effects scholars, Jones is referring to the process of *elaboration*. Elaboration as defined by Petty and Cacioppo (1986) is the activity of generating cognitive responses in response to a given message. However, elaboration involves extending one's cognitive activity beyond what is offered in the message alone, instead seeking to connect this new information with preexisting sociological, psychological, and contextual mental frameworks. The meaning that ultimately results from this process often extends far beyond the original message as encoded by its producer and sender. Our point here is to highlight how the integration of more critical-cultural work into our empirical effects-based traditions does not mean abandoning existing theory. In fact, we will most likely find our existing theories to be rendered richer and more meaningful as we explore these links across our epistemological traditions (Hmielowski et al. 2011a).

What we propose is an integrated approach to political entertainment effects that incorporates the tenets of extant research on media-to-media relationships (Holbert & Benoit, 2009), better utilizes existing insights from critical-cultural scholarship, exhibits an awareness of historical, economic, and technological context, and employs an integration of existing cognitive and social psychological theory. In so doing, we seek to capture and reflect the context surrounding the media experience, as well as individuals' perceptions of the complex media environment. In essence, this broad model would:

- 1 Understand and acknowledge the rich historical, economic, and technological context underlying today's hybrid political entertainment landscape.
- 2 Consider the *social* and *intertextual* realities of the new media experience.
- 3 Use these frameworks to inform the development of effects mechanisms rooted in cognitive and social psychology.
- 4 Integrate the role of multiple messages (intertextuality) in the effects process (either directly through measurements of exposure or indirectly through measurements of audience perception, or content hybridization).
- 5 Emphasize the audience experience as one of active meaning construction.
- 6 Incorporate detailed studies of audience (characteristics and motivations) and content in this broader contextualized approach.
- 7 Deduce an appropriate cognitive and social-psychological mechanism to explicate the operative processes and their hypothesized effects.

Such an ambitious agenda cannot be undertaken by a small group of scholars with disparate message-focused research projects. What is required is a healthy marketplace of ideas shaped by a critical mass of scholars who are willing to work across epistemological boundaries. Once more, this work should not be undertaken solely within the United States or in Western democracies. Such a research agenda should take on a global perspective as broad issues being raised in this chapter are not bound by place or time (e.g., Tsftati, Tukachinsky, & Peri, 2009). This kind of collaboration is particularly difficult given that such research is being conducted across a multitude of disciplines and using a variety of methods and terminologies. However, we hope that through the publication of this chapter in such a comprehensive text, we can help to develop new and improved lines of communication. Through the integration of ideas across discipline and method, we see a bright future for scholarship in the area of politics and entertainment. The challenges are great, but so too is the potential for profound developments in our understanding of citizens' interactions with their political worlds.

NOTE

- 1 The authorship order is alphabetical – each author contributed equally to the chapter. The authors would like to thank Jayeon Lee (MA, University of Texas at Austin), doctoral student in the School of Communication at The Ohio State University, for her article collection efforts. We would also like to thank Mao Vang and Stefanie Best for their efforts during the final editing stages.

Digital Democracy

How the Internet Has Changed Politics

Leticia Bode, Stephanie Edgerly, Ben Sayre,
Emily K. Vraga, and Dhavan V. Shah

ABSTRACT

Over the past two decades, the Internet has increasingly become part of the everyday life of US citizens. This chapter considers the impact of the growing use of the Internet on media use and political behaviors. Specifically it addresses the theoretical, practical, and empirical consequences of various uses of the Internet for sociability, social capital, online formats of news and politics, political blogs, online public spheres, and political messaging. We further consider the emergence of online spaces as sources for information and social interaction, and the implications of these spaces for democracy. Highlighted in this discussion is the advent of social media (e.g., blogs, Facebook, YouTube), and the corresponding development of new spaces in which citizens may “do” politics.

Using the Internet

Over the past two decades, the Internet has increasingly become part of the everyday life of US citizens. Seventy-one percent now report using the Internet on a daily basis, and their activity online is no longer limited to emailing and checking NCAA scores (Pew Internet & American Life Project, 2009). Citizens are using the Internet in new ways: to find information and products, to entertain themselves, and to communicate

with others in ways that extend beyond email. And with each passing year, the Internet offers more opportunities for information and communication than ever before. As it continues to become part of the everyday existence of most US citizens, it becomes increasingly important that we understand the role of the Internet in communication and politics.

The Internet has fundamentally changed the way we communicate and interact with the world. Twenty years ago, email was not a reasonable substitute for a phone call or letter. Fifteen years ago, you had to mail checks to pay bills. Ten years ago, no one watched videos online, and five years ago, it was “normal” to lose touch with friends over the years. Now we have instant communication, greater bandwidth, and a more networked and integrated Web 2.0. For better or worse, the Internet impacts the way US citizens go about their daily lives.

That impact has spread into the realm of politics as well. Candidates increasingly rely on the Internet to raise money and to connect with voters (Pew Internet & American Life Project, 2008; Trippi, 2004) and once in office, use the Internet to provide access to an ever-increasing range of information on governmental policies and activities. But if candidates, politicians, and the public rely increasingly on the Internet for information, this raises the question: How does the Internet change politics?

The Internet, Sociability, and Politics

Platonic theory suggests that politics, stripped to its core, is an interaction between people. To understand the impact of new media on politics, we must first understand whether and how people have changed their interactions as a consequence of the development of new media. Moreover, sociability is linked to the mutual generation of social capital, which has been the focus of a great deal of research on online communication and politics because of its relation with civic and political participation (Wellman, Quan Haase, Witte, & Hampton, 2001; Chapter 21, this volume).

Sociability and Interaction

The impact of the Internet on sociability was one of the first questions addressed by a new brand of academic: the Internet scholar. There was great concern that time spent on the Internet would displace time spent interacting with friends and family. On the other hand, the Internet offered the potential for *increased* interaction, lowering the cost of communication, and limiting some of the problems caused by distance.

Most well-known of the scholarship indicating a negative relationship between Internet use and sociability is a study by Kraut and colleagues in 1998. Employing longitudinal data, the authors suggested that their data supported a time displacement theory for Internet use: time spent online was taking away from time spent in

person interacting with one's social circle, leading to depression and loneliness.¹ Although these impacts were relatively small, the findings fueled the debate about the potentially negative relationship between Internet use and sociability. However, Kraut's time displacement theory was challenged by Wellman and Hampton (1999), who argued that the Internet was not displacing communication with family and neighbors but was instead replacing time spent alone at home. They concluded the Internet actually facilitates the establishment of ties with multiple social milieus, and fosters cross-cutting ties across social groups.

By 2001, however, scholars began to agree on one core principle – it matters not only *whether* one uses the Internet, but *how*. A series of major works were published in 2001 and 2002, acknowledging that “utopian claims and dystopic warnings based on extrapolations from technical possibilities have given way to more nuanced and circumscribed understandings of how Internet use adapts to existing patterns, permits certain innovations, and reinforces particular kinds of change” (Dimaggio, Hargittai, Neuman, & Robinson, 2001, p. 307). With this in mind, Nie performed a meta-analysis that suggested a spurious relationship existed between sociability and Internet use, and instead indicated that the same factors that promote sociability (namely education and wealth) also correlate with Internet use (Nie, 2001). Conversely, he also found some support for a time displacement theory to explain findings of a negative relationship between Internet use and sociability, which was corroborated by research which followed (Nie & Hillygus, 2002). Other studies contributed to a more refined understanding of the impact of Internet use on sociability, suggesting that the impact differed depending on the strength of the social tie in question (Papadakis, 2003; Pew Internet and American Life Project, 2000). In general, research since this time has found positive impacts of Internet use on well-being and sociability (BCS, 2010).

More recently, research has moved to explore emergent venues, including wireless Internet “hotspots” and social network sites, to answer new questions related to politics and sociability. If people are online not only in traditional places (such as the home or the office), but also in parks and public spaces, are they likely to become more insulated from the outside world? On the one hand, people using wireless Internet in public spaces are less exposed to diverse others because they are less interactive in that physical space. On the other hand, those users are likely to communicate with more diverse acquaintances online than are mobile phone users (Hampton, Livio, & Sessions, 2009). Therefore, preliminary research suggests that the expansion of the Internet to new locations can have mixed benefits.

The growing use of social network sites (SNSs) has also been acknowledged by the scholarship on Internet use, politics, and sociability. Early results indicate SNSs tend to have positive impacts on sociability. Notley (2009) finds that online social networks provide “at risk” youth with valuable opportunities for social inclusion. Others find that for the average youth, online social networks have become essential to daily life: “serv[ing] as a space for: (1) emotional support, (2) relational maintenance, and (3) self-presentation” (Greenhow & Robelia, 2009, p. 1141). A notable

exception is a Chinese study, which found depression in youth correlated with Internet use (Rabin, 2010).

Although Internet use is now generally considered to have positive consequences for sociability and interaction with others, some scholars still worry about the Internet's impact on society as a whole. Cass Sunstein has written extensively about his concern that the customizability of the Internet will lead to an echo chamber, in which people are exposed only to like-minded others and the topics that they choose (2008). The concern is that such customization leads to polarization and limits some of the benefits of cross-cutting messages that exposure to a diversity of viewpoints should promote, like tolerance (Mutz, 2006).

Sociability and Social Capital

Another aspect of sociability is social capital (see Chapter 21, this volume). Drawing upon the work of Putnam (2000), we conceive of social capital as the connectedness of individuals, the ties within and between groups, and the norms of trust and reciprocity in these connections. Understood this way, social capital has political consequences, as it is correlated with civic and political behaviors such as volunteering and voting (Shah, 1998).²

Generally speaking, scholars have found a positive relationship between Internet use and social capital. In a case study by Syrjanen and Kuuti, "IS [information systems] aided the formation of an infrastructure for social interaction, through collective conversation, action, and interaction space, which can be seen to facilitate the creation of new knowledge and thus the formation of social capital" (2004, p. 41). Others agree, suggesting that Internet use provides an additional forum for social capital, rather than transforming or diminishing it overall (Quan-Haase & Wellman, 2004).

Others argue that the Internet has a more nuanced impact on social capital, and its generation depends on the type of Internet use in question. For example, using the Internet for information-seeking purposes has been linked to positive social capital generation, whereas recreational Internet use has the opposite effect (Shah, Kwak, & Holbert, 2001). Similarly, the amount of Internet use also matters, as heavier users are more likely to participate politically and civically (Wellman, Quan Haase, Witte, & Hampton, 2001). Moreover, the type of community generated online may also have disparate impacts on social capital generation: communities based on geographic associations are likely to increase face-to-face interaction, whereas more disperse communities may decrease social capital (Blanchard, 2004).

New research on Internet use and social capital has also focused on the burgeoning use of social network sites. Ellison and colleagues find that Facebook use not only promotes traditional social capital, but also results in a new kind of social capital, "high school social capital," relating specifically to maintaining ties after geographical relocation (Ellison, Steinfield, & Lampe, 2007). Other studies considering social net-

working sites also find support for various manifestations of social capital, including life satisfaction, social trust, civic engagement, and political participation (Valenzuela, Park, & Kee, 2009).

Summary and Future Research

Research on the relationships between Internet use, sociability, and politics has come a long way. As Wellman puts it, it is now that “the real analysis begins with more focused, theoretically-driven projects” (2004, p. 127). New trends in Internet proliferation, and the further incorporation of Internet use into the daily lives of most people are likely to modify the relationships we now see. Importantly, we should focus on developing theories that can be applied to future changes to the Internet. One thing is clear: “The Internet is helping each person to become a communication and information switchboard, between persons, networks, and institutions” (Wellmann, 2004, p. 127). Understanding the changing dynamics between the Internet, institutions, and individuals will be paramount for future research investigating Internet use, social outcomes, and political behavior.

News and Politics Online

As the Internet has developed and expanded, the focus of research has gone beyond the question of general Internet use and its effects to consider how people are using the Internet as a source of political information, and to what effect. A basic tenet of democratic theory is that voters’ choices must be based on informed thinking about political issues, so it is only natural that as online media have gained attention at the expense of offline outlets, political communication scholars have increasingly scrutinized the performance of the Internet as a source of political information.

Early research on online news was characterized by two extreme viewpoints: utopians anticipating the emergence of direct democracy as a result of the world of information and communication that would be at everyone’s fingertips (see, e.g., Coombs, 1998), and their dystopic counterparts predicting a cacophony of misinformation, narrowcasting taken to undemocratic extremes, and the general displacement of publicly significant news and information in favor of an expanding set of entertainment distractions (see, e.g., Sunstein, 2008). Bruce Bimber’s (1998) “accelerated pluralism” is a significant exception to early research regarding online news.

Noting that the overall media system was already undergoing a process of fragmentation, Bimber’s contention was that the introduction of online news would have the effect of speeding up this process. Bimber acknowledged the tenuousness of prognosticating about the future of a medium in its infancy, but expressed some doubt that the Internet would undermine the influence of established elites, and did

not see the Internet as something that would “restructure the nature of community.” Grounding his account in models of political participation and psychology, Bimber granted some chance that the Internet would foster media that were more independent from elites and interest groups and more representative of the public, and he argued that it would greatly expand the accessibility of public information. However, what Bimber most confidently anticipated was a diminishment of established media’s capacity to set the political agenda. The new media system would be less effective for established institutions and more tailored to the aims of issue-based group politics.

Bimber’s early doubts about the Internet enabling a populist infusion to politics are still debated. For example, recent presidential campaigns have revolutionized fundraising by making use of the Internet. In 2000, McCain enjoyed some surprise online fundraising success after performing well in early primaries. Four years later, Howard Dean rode an unexpected wave of online campaigning and fundraising to emerge as the early frontrunner in the Democratic nomination campaign, relying to an unprecedented extent on large numbers of small donors. In 2008 Obama set new records in fundraising for a presidential campaign garnering more than \$650 million. More than half of that money came from increments of \$200 or less, much of which was collected online (Luo, 2008).

Based on campaign fundraising alone, there does seem to be evidence of the Internet providing a boost to populist strains of US politics. At this stage, however, it is trickier to gauge the extent to which the Internet is changing the nature of community organizing and group formations – the other of Bimber’s two doubts. Online political communities can be found in the blogosphere, in social networks, and on the websites of political campaigns, but the goals of political organizing – mobilizing people to attend rallies, and turn out on election day – are still largely offline phenomena, suggesting that effective online organizing must still pair with real-world activities to be successful. The dynamics of political campaigns are in flux, and the Internet is by no means the only factor.

Exploring the psychological impact of online news, several studies have examined the varying effects of online news due to differences in information structure and consumption. In one experimental study comparing knowledge acquisition from paper and online versions of a story, Althaus and Tewksbury (2002) found that, in contrast to the regularity of professional TV and print publications, the lack of coherent, consistent cues online, as well as the decreased organization of information, resulted in less integration of information. They argued that newspaper readers had learned cues that differentiated a long-form story “above the fold” on the front page and a short item relegated to a back section of the paper. Online formats, at least at the time, had not developed such consistent cues. Along those lines, early studies showed decreased learning as a result of the “non-linearity” of news websites (Eveland & Dunwoody, 2002). More recent work, however, suggests that the nonlinearity of websites does not inhibit learning in its entirety, but changes the type of learning that takes place. Although linear sites (which mimic print news) encourage

factual learning, nonlinear sites increase knowledge structure density – allowing a more interconnected understanding of the world (Eveland, Cortese, Park, & Dunwoody, 2004).

The early utopian view of online news championed the low cost and increased access to political news and information. Recent research, however, has shed empirical light on how individuals actually consume online information. The notion of “googlearchy,” put forward by Hindman, Tsioutsouliklis, and Johnson (2003) examined the popularity of websites using complex searching and crawling tools, counting links in a manner similar to search engines themselves (also see Hindman, 2009). They argue that the Internet seems to be dominated by a very small number of websites, in spite of a multitude of sites available. However, it is unclear whether this finding holds in the changing environment online, where search engines are but one means of arriving at a particular website.

Summary and Future Research

Looking forward, many questions need to be explored further about the nature of news and politics online. While early online political information was dominated by major news sources with an offline presence, the nature of political information available online is changing. Today’s Internet users are confronted with a cacophony of online information, including traditional news, blogs, user-generated sites such as Wikipedia, and more. Research must now focus on how these burgeoning news sources – often without an offline presence – compare to their more traditional antecedents.

A second trend to consider is the growing concern that traditional media cannot make money providing content online at no cost. If the professional media follow through with increasingly sincere threats to make users pay for online information, it could mean that a brief era of egalitarian access to information will end as information becomes accessible only to those users who are willing to pay for it. It is also worth remembering that the influences of the Internet on politics are still just a subplot in the large domain of how politics is playing out in these times, regardless of the tools and methods being used.

Blogs

Although traditional news sources remain among the most visited websites, people are increasingly seeing the Internet as a place for more than news (Pew, 2008a). Many now visit a variety of online information sources, including political blogs. According to Farrell and Drezner (2008), a blog can be defined as “a web page with minimal to no external editing, providing on-line commentary, periodically updated

and presented in reverse chronological order, with hyperlinks to other online sources” (p. 2). The growth of political blogs in the last decade has been astounding: from a relatively unknown medium in 2004, when Howard Dean’s blog “changed politics” (Trippi, 2004) to their heavy use in 2008, when over a quarter of US voters used blogs for political information, an increase that is likely to continue, as younger voters are most likely to turn to blogs for information (Pew, 2008b).

The rise in political blogs has not gone unrecognized by scholars. Research has emphasized two domains: the content available on blogs, including the motivations of bloggers, the potential for selective exposure, and perceptions of media credibility, and the consequences of blog readership for processing and learning, interpersonal trust, and participatory democracy.

Content on Blogs

One of the primary roles of political blogs is to provide readers with information from other sources, inserting commentary on traditional news and serving a watchdog function over the government (McKenna & Pole, 2008). This content closely matches bloggers’ reported extrinsic motivations – informing people about relevant information, serving as a political watchdog, and critiquing mainstream media (Ekdale, Namkoong, Fung, & Perlmutter, 2010). Although internal motivations (such as formulating new ideas) are also important, it is extrinsic motives which lead bloggers to post information about political candidates and to participate offline, establishing a clear link between bloggers’ reported goals, blog content, and political blogger relations with the larger political sphere (Ekdale et al., 2010).

The ability of readers to self-select into content is an important consequence of the new media environment (Mutz, 2007). People often take advantage of this ability, using primarily ideologically congruent news sources and political blogs (Iyengar & Hahn, 2009; Veenstra, Sayre, & Thorson, 2008), especially among those who perceive the media to be hostile to their views (Hwang, Schmierbach, Paek, Gil de Zuniga, & Shah, 2006; Hwang, Thorson, Borah, Cleland, & Perlmutter, 2007). The ability to select agreeable content may partially arise from the structure of blogs: blogrolling – or creating links to other blogs – allows blogs to link to like-minded spheres, and is especially prominent among conservative blogs (Adamic & Glance, 2005). However, substantial skew remains in these blogroll links, with a few highly ranked blogs receiving many links in, leaving a long tail of blogs with few links (Farrell & Drezner, 2008).

It is not only important to consider how bloggers *believe* they relate to a larger political sphere, but also to examine how blogs *actually* influence the environment. If blogs have the ability to alter the agenda of the mainstream media it may be less important that blogs are highly skewed and people are selecting into agreeable content. However, research on the agenda-setting power of blogs suggests the relationship is complex: while blog coverage – and posts on these blogs – can sometimes

lead to more coverage in the news media, this relationship does not emerge for all issues and may even be negative when journalists move away from topics they think blogs have covered too extensively (Wallensten, 2007, see Chapter 1, this volume).

Implications of Blog Readership

The ability to expose oneself to primarily like-minded information may drive the perception among blog readers that blogs are one of the most credible sources of information (Johnson & Kaye, 1998, 2004). Because people tend to rate agreeable information as more credible (Kunda, 1987), they are likely to see the blogs they read – which tend to agree with their views – as highly credible.

But the question of media credibility does not stop there. Given that bloggers' goals include critiquing the mainstream media, and that blog content reflects this goal (Ekdale et al., 2010; McKenna & Pole, 2008), it is also important to examine how credibility is understood when multiple sources of competing credibility are contained on the same page. Research suggests that the blog context in which a news article is found can affect ratings of story credibility, even when the content of the news story is consistent (Greer, 2003; Thorson, Vraga, & Ekdale, 2010). Evaluations of news story credibility and source credibility – such as the website on which the story is found – are highly correlated (Greer, 2003), so that a news article found on a “credible” website like that of the *New York Times* should be rated more highly than the same story found on a less reputable website. However, beyond the source cue, the tone and position of the site also have an influence: repurposing of news content on an uncivil or politically incongruent blog highlights the credibility of the news story (Thorson et al., 2010). Of course, the target of the attack should matter: critiques of the news story itself, rather than political actors or policy proposals, may instead emphasize its flaws and lessen news credibility.

It is not only perceptions of the news story that change when it is moved into a new context. Changes in the formatting and structure of information online can also impact memory. Eveland and Dunwoody (2001, 2002) developed the theory of structural isomorphism, which suggests that the structure of the Internet, including use of hyperlinks, has the ability to mimic memory structures, altering the nature by which information is gained. However, these differences may not affect everyone equally: blog readers appear to have more closely linked mental networks on political issues, making them more susceptible to an ethical frame of a news story (Veenstra, Sayre, & Thorson, 2008). If the online information structure mirrors memory structures, more research is needed investigating how this interacts with people's predispositions to affect learning and opinion formation.

Examining one type of structural format unique to political blogs, the close juxtaposition of blog commentary and neutral news information may impact citizen learning. When a neutral and a persuasive source are closely intertwined – a format available on many political blogs – the possibility for source confusion in learning

new information arises. When individuals are not motivated to carefully process the information – such as when they are lower in need for cognition or exposed to congruent blog commentary – they are more likely to confuse the source of their information (Vraga, Edgerly, Wang, & Shah, 2011). The effects on fact recall and source identification from changes in structure and tone are not limited to college students: even readers of political blogs are less able to identify the source of their information when faced with a more interspersed structure (Vraga, Edgerly, Wang, & Veenstra, 2009).

The question of whether political participation correlates with blog exposure is also important. Research suggests that political blog readers are highly participatory, and that this participation occurs in both new online expressive styles of participation, as well as more traditional offline formats (Gil de Zuniga, Veenstra, Vraga, & Shah, 2010). Exposure to like-minded blog commentary is an especially strong predictor of participation, mirroring offline research that suggests exposure to homogeneous opinions promotes greater political engagement (Hwang et al., 2007, Mutz, 2006).

Not all of the information encountered on blogs is likely to occur within this homogeneous echo chamber. Some researchers suggest that fears about the echo chamber online are overstated: although people do show some tendency to self-select congruent stories, the tendency to avoid incongruent stories is weaker than expected, and once confronted with incongruent information individuals spend substantial amounts of time reading it (Garrett, 2009). Furthermore, even attempting to view only congruent information does not mean that individuals avoid the opposition: in fact, blog posts may be more likely to mention the opposing party than their own (Koop & Jansen, 2009).

When exposed to attacking commentary, especially that couched in an uncivil tone, both positive and negative emotional reactions are aroused. When a blogger takes an uncivil tone in attacking the opposition, people feel proud of the blogger, whereas when their own party is being attacked, they feel angry (Fung, Vraga, & Thorson, 2011). This emotional arousal is differentially linked to action tendencies – anger spurs desires to “get back at” the blogger and mock her efforts, whereas pride deters people from these actions (Fung et al., 2011). Furthermore, negative emotional arousal is also linked to changes in social identity, less open-mindedness, fewer discussions with the other side, and greater desire to participate politically (Thorson, Fung, & Vraga, 2008; Vraga, Thorson, Fung, & Meyer, 2009). Ultimately, the arousal that can result from exposure to attacks on political blogs can result in both beneficial and harmful outcomes.

Summary and Future Research

Thus, scholarly research has begun to investigate the effects of this new form of media content available online. Research has demonstrated that blogger motivations

have a substantial impact on the content they produce online – and differences in this content affect media perceptions, learning of new information, and desire to participate politically. Although citizen-authored communications have always been a part of political life, the growing readership and potential agenda-setting power of political blogs may be an important source of bottom-up communication led by the public. Future research needs to more closely examine not only who is publishing political blogs, but also who is commenting, to better understand this potential for the public to influence politics.

Of course, blogs are not the only, or even the most popular, location for citizen activity online. More and more people report increasing use of social networking sites, not only to connect with friends, but also to search for information and express their political preferences (Bode, Borah, Vraga, & Shah, 2009; Pew, 2008b). Therefore it is also important to study other sites of social interaction online to truly understand the potential of the Internet.

Online Public Sphere and Political Messaging

A growing line of research explores the transformation of the public sphere from one intrinsically linked to physical space to one existing in a virtual arena (Janssen & Keis, 2005). Dahlgren (2005) identifies three dimensions that impact the viability of an online public sphere. In the structural sphere, the Internet has institutional features – ownership, control, regulation, financing, legal protection – that direct attention to or from particular communication spaces. The representational dimension concerns the output of the media: fairness, accuracy, completeness, plurality of views, framing, and agenda setting. At the interaction level the Internet affords individuals opportunities to engage with media messages and with other individuals. According to Dahlgren (2005), the “cyber transformation of the public sphere” (p. 151) has been marked by growing commercialization of the Internet (structure) that serves to constrain use of media for civic purposes (representation), and overshadows deliberative exchanges with so many non-political ones (interaction). Still, the Internet does offer possibilities for quality information exchange and improved civic engagement via online civic messaging (emailing a politician, organizing a social activity, etc.).

Formal Settings That Guide Online Deliberation

Many studies have explored the Internet’s ability to link citizens for deliberative discussion. Jensen (2003) studied www.nordpol.dk, a Danish site designed to reduce barriers of communication between citizens and politicians. He found deliberation to more accurately characterize horizontal exchanges (citizen–citizen, or politician–politician), whereas vertical communication was characterized by information sought

(citizen–politician) and provided (politician–citizen). Although politicians and citizens characterized the experience as a democratic success, it existed amid low overall participation among Danish citizens. Similarly, Cappella, Price, and Nir (2002) found that participating in a year-long online discussion during the 2000 presidential election elevated participants' argument repertoire; online interaction and group deliberation helped people state arguments for and against their own position.

Iyengar, Luskin, and Fishkin (2004) applied their deliberative poll (DP) framework online to test its ability to produce more informed individuals. Using voice recognition software, the weekly discussions were voice- rather than text-based and used a moderator to manage the speaking queue. As with face-to-face DP, participants were encouraged to submit questions to a group of experts, and answers were posted before the next meeting. The authors found that compared to a control group, online DP participants knew more about candidates and policy and showed more policy-based voting. This result may be especially telling considering the desired results were observed with a modest intervention of five one-hour online meetings.

Expression through Informal Social Channels

Interactive messaging tools (email, instant messaging, online chat rooms) provide individuals with opportunities to share political information and perspectives. Online communication can also help individuals organize to direct their actions toward common concerns. For example, 40% of email users in 2008 received an email encouraging political involvement, and 1 in 10 used email to encourage others to get involved in politics (Pew Internet & American Life Project, 2009).

Results are mixed on whether online discussion facilitates high quality interactions (Koop & Jansen, 2009). Some research has found that discussants in political Usenet newsgroups expressed viewpoints in a civil and polite manner (Papacharissi, 2004), chat rooms exemplified norms of viewpoint diversity and idea exchange (Stromer-Galley, 2003), and most postings on bulletin boards were related to or responding to earlier messages (Rafaeli & Sudweeks, 1997). However, other research suggests a tendency for Internet users to reject opinion diversity and provide content that is of little substance: online bulletin boards serve as ideologically congruent communities of interest, (Uslaner, 2004); online forums offer debates of the "Did so" "Did not" variety (White, 1997); and campaign blogs offer primarily negative posts, few reasons, and discouragement of opponents offering substantive comments (Meraz, 2006).

Social media sites are also becoming a forum for political expression and influence. According to data from the United States, 19% of Internet users post material on political or social issues or use social networks for civic or political activities (Pew Internet and American Life Project, 2009). Social media sites like YouTube and Facebook allow users to express views to a larger audience and reach out to other users and groups. Recent work by Bode, Borah, Vraga, and Shah (2009) suggests political use of Facebook predicts political participation and political engagement,

and at increasing rates, during an election cycle. Similarly, in the 2008 elections YouTube played an influential role in terms of volume and tone of videos (Cortese & Proffitt, 2009) and in mobilization of young voters (Dalton, 2009). A comprehensive study of YouTube and California's Proposition 8 found that YouTube functioned as a space for same-sex marriage supporters to express themselves after the election (Thorson, Ekdale, Borah, Namkoong, & Shah, 2010). Videos were characterized by diverse reason-giving in commentary (Edgerly et al., 2009), and YouTube videos influenced traditional mass media coverage of Proposition 8 (Sayre, Bode, Wilcox, Shah, & Shah, 2010).

Other studies of YouTube present a more skeptical outlook on the site's ability to introduce new content and engage in political discussion, with Turkheimer (2007) and Milliken, Gibson, O'Donnell, and Singer (2008) finding negative political clips generate more attention, suggesting people may be drawn to sensational political videos on YouTube. In an experimental study, Towner, Dulio, and Pazdro (2009) found exposure to user-generated content on YouChoose '08, YouTube's official 2008 election page, increased cynicism among viewers. One study found YouTube videos averaged 1.6 comments per video (Carlson & Strandberg, 2007), and another that these comments were often negative in tone (Milliken et al., 2008).

Summary and Future Research

A key issue for political and civic expression online is its ability to carry over to the offline environment. Recent research has sought to clarify the relationship between online expression and offline civic behavior. Shah, Cho, Eveland, and Kwak (2005) found online and offline media both spur interpersonal political discussion and online civic messaging which predicts subsequent civic participation. The results of Shah et al. (2005) suggest the Internet's low barriers to entry for political and civic expression do not diminish its predictive power for offline civic activities.

Conclusion

The Internet is not likely to disappear, nor is its growing influence in the political realm. Whether it is the use of Twitter to coordinate Iranian protests, the record-breaking campaign to raise money for Haiti relief via text message, or the growing amount of government data available online, the Internet is facilitating sociability and political behavior in new and important ways. As a scholarly community, we must continue asking questions about how and why this occurs and investigate the potential implications of such changes.

Communication is essential in order for political life – voting, campaigning, and volunteering – to take place. The Internet is important for politics because it lowers

the costs of communication and reduces the barriers of time and space, facilitating new kinds of communications. As Klotz puts it, "Interactivity makes the Internet a formidable medium for politics. Disseminating information, mobilizing, and citizen interaction lie at the heart of politics. The Internet is, therefore, well suited for political use" (2004, p. 5). The Internet can encourage voting (Tolbert & McNeal, 2003), allow for online political activities (Best & Krueger, 2005), and encourage political participation (Polat, 2005). It offers a place to communicate with individuals and with the general public (Ekdale et al., 2010; Stromer-Galley, 2003). Each of these behaviors contributes to democracy; the role the Internet plays in politics therefore cannot be denied.

However, much work remains to be done. The Internet is a frustrating beast to study, because it is a different creature from day to day. There is always a new innovation – social networking sites, video-sharing sites, microblogging sites – that alters what people are able to do online, thus changing the political culture online as well. Scholars must continue to press forward on questions examining online politics, even when they are difficult to study and rapidly changing. Furthermore, scholars must put more effort into developing models for the effects of Internet use that bridge disciplines, making these theories better equipped to deal with the shifts the Internet will bring to politics as the medium continues its one constant: change.

NOTES

- 1 Kraut came to different conclusions in a later paper, in which he determined that initial negative effects dissipated after the first years of Internet use. See Further Reading.
- 2 Though it is important to note that social capital does not always result in positive outcomes.

Advances in Public Communication Campaigns

Charles K. Atkin and Ronald E. Rice

ABSTRACT

This chapter presents an overview of the recent literature on the persuasive effects of public communication campaigns. The scope of the review is substantial, ranging from traditional media to new technologies and from US settings to developing countries. The campaign topics primarily deal with health promotion, along with prosocial behavior and environmental reforms. The chapter examines key theoretical concepts, processes, and strategic guidelines, including campaign design, evaluation (formative, process and summative), types of effects (direct and indirect), messages (prevention vs. promotion vs. informational vs. persuasive, and appeals), message sources, mediated communication, and quantitative dissemination factors. The chapter then illustrates these guidelines with three campaign foci: drug use, smoking, and risky drinking.

Studying Public Communication Campaigns

Public communication campaigns encompass strategies for producing effects on knowledge, attitudes, and behavior across a variety of domains, including political, prosocial, environmental, and health outcomes. Definitions of public communication campaigns typically specify the following components: Purposive attempts to inform,

persuade, or motivate behavior changes in a relatively well-defined and large audience, generally for noncommercial benefits to the individuals and/or society at large, within a given time period, by means of organized communication activities involving mass and online/interactive media, and often complemented by interpersonal support (Rice & Atkin, 2009). The theories, designs, and impacts of media-based public campaigns have been summarized by Abroms and Maibach (2008), Atkin (2001), Backer, Rogers, and Sopory (1992), Noar (2006), Rice and Atkin (2009), and Snyder and Hamilton (2002). This chapter focuses primarily on the role of media campaigns in health promotion, because political effects are covered elsewhere in this volume (Section V: In the Political Arena) and because the theory and literature on health campaign effects are far more advanced than for environmental and prosocial effects. The communication strategies described in this chapter complement and augment the components of the social marketing framework presented in Chapter 25.

The content coverage emphasizes persuasive aspects of campaigns, which are the more consequential and well-studied aspects compared to awareness-oriented or instructionally oriented campaign strategies. Because the research literature indicates that campaigns typically have only limited direct effects on behaviors, a key priority throughout the chapter is to identify concepts, processes, and strategies for increasing the effectiveness of public communication campaigns.

The strategic guidelines presented in this chapter draw upon models, processes, generalizations, and recommendations in the voluminous quarter-century research literature on campaigns and related forms of persuasive communication. Key book-length theoretical perspectives and reviews include Atkin and Wallack (1990), Edgar, Noar, and Freimuth (2007), Hornik (2002), Maibach and Parrott (1995), O’Keefe (2002), Rice and Atkin (2001), Salmon (1989), Stiff and Mongeau (2003), and Witte, Meyer, and Martell (2001).

The following sections briefly describe the main phases and components of communication campaigns: Campaign design, evaluation (formative, process and summative), types of effects (direct – focal segment, prevention/treatment – and indirect – interpersonal influencers, media and policymakers), messages (promotion/prevention, informational/persuasive, qualitative dimensions, persuasive incentive appeals), message sources, mediated communication (interpersonal, mass, digital/online), and quantitative dissemination factors. The chapter then provides a brief summary of a major campaign from each of three campaign foci: drug use, smoking, and risky drinking.

Campaign Design and Management

Campaign design begins with a conceptual assessment of the situation to determine opportunities and barriers and to identify which outcome behaviors would be performed by which people (Atkin & Salmon, 2010). The design specifies *focal segments* of the population whose practices are to be changed, and the bottom-line *focal*

behaviors that the campaign ultimately seeks to influence. The next step is to trace backwards from the focal behaviors to identify the proximate and distal determinants, and then create *models* of the pathways of influence via attitudes, beliefs, knowledge, social influences, and environmental forces. The next phase is to examine the model from a communication perspective, specifying *target audiences* and *target behaviors* that can be directly influenced by campaign messages. A sophisticated campaign will seek to impact the most promising pathways, guided by a comprehensive plan for combining manifold components, and an appropriate theoretical framework matched to the desired outcome and the relevant audiences and social systems.

Among the notable frameworks are the Ajzen and Fishbein (1980) theory of reasoned action, which combines attitudes and norms along with belief expectancies and values to predict behavioral intentions; campaigns can influence beliefs about the likelihood of experiencing positive and negative outcomes and other components of the theory. Ajzen, Albarracin, and Hornik (2007) present models that incorporate reasoned action approaches into the theory of planned behavior; this provides insight into the pathways of influence from campaign messages to behavioral outcomes. Likewise, viewers exposed to messages depicting rewards for actions exhibited by credible role models are more likely to perform similar behaviors, according to Bandura's (1986) social cognitive learning theory.

The integrative theory of behavior change (Cappella, Fishbein, Hornik, Ahern, & Sayeed, 2001) applies a combination of the health belief model, social cognitive theory, and theory of reasoned action in a campaign setting. The transtheoretical model (Prochaska & Velicer, 1997) identifies subgroups based on their current stage in the process of behavior change (precontemplation, contemplation, preparation, action, or maintenance). Slater (1999) integrates the application of media effects, persuasion, and behavior change theories in a stages-of-change framework. Over time, campaigns target specific audience segments at different stages of progression, which is now more feasible with new technology such as interactive websites.

Diffusion theory (Rogers, 2003) describes how new ideas and practices spread through interpersonal networks and the influential role played by opinion leaders. Opinion leaders tend to have greater exposure to media messages about a domain such as health, and are more likely to exercise informal influence over the attitudes and behaviors of friends and family members. A relevant application from the persuasion field is the dual processing conceptualization articulated in the elaboration likelihood model (Petty & Cacioppo, 1986) and the heuristic systematic model (Eagly & Chaiken, 1993); campaign strategists may design varied campaign stimuli operating via peripheral as well as central routes to attitude change. Glanz and Bishop (2010) review behavioral science theories used in public health interventions and campaigns.

Formative Research in Campaign Design

Effective design relies on the background information about the focal segments and interpersonal influencers collected in formative evaluation (Atkin & Freimuth, 2001).

Formative research is important in order to bridge the substantial gap between campaigners and their audiences, in terms of level of involvement in the topic, information holding, and attitudinal orientations. The first stage of formative evaluation involves preproduction information gathering to learn more about the situation and audiences. Databases, focus groups, and custom surveys provide useful understandings and insights into audience predispositions (e.g., current behavior patterns, values, attitudes, beliefs, and knowledge), channel usage patterns, and evaluations of prospective messengers and appeals. For community-based campaigns, researchers analyze communication networks, patterns of opinion leadership, and relationships among businesses and government agencies (Bracht, 2001).

In lieu of collecting customized preproduction information, designers can utilize available research programs with standard inventories of demographic and psychographic variables for use in campaign development. For example, the Centers for Disease Control and Prevention (CDC) licenses the annual American Healthstyles survey for audience analysis (CDC, 2009), and the Health Information National Trends Survey (HINTS) provides access to research on a representative US sample of adults on variables such as channel usage and risk perceptions (National Cancer Institute, 2009).

The second stage of formative research involves pretesting of rough message presentations to generate qualitative reactions in focus group discussion sessions and to measure quantitative ratings in message testing labs. Pretesting helps to determine whether the audience regards the message content and style positively (informative, believable, motivating, convincing, useful, on-target, enjoyable) or negatively (preachy, disturbing, confusing, irritating, dull). For example, pretesting can detect problematic elements that may trigger psychological reactance on the part of the audience, which can produce the dreaded boomerang effects that reinforce counter-productive behaviors.

Process Evaluation of Campaign Management

Process evaluation assesses both the design and management of the campaign, the extent to which designed elements have actually been implemented, and ways in which the campaign program can be improved for subsequent designers and implementers (Steckler & Linnan, 2006). Process evaluation is useful for maintaining ongoing awareness of, and identifying lessons for overcoming, social and structural obstacles, in community, workplace, school, state, and national campaigns. Such evaluation is often required by funding agencies, and provides valuable insights for subsequent campaign designers.

Summative Evaluation of Campaign Effects

After a campaign has been implemented, summative evaluation research is performed to assess outcomes. Valente (2002) summarizes the basic methodologies,

including field experimental, cross-sectional, cohort, panel, time-series or event-history designs, although qualitative components and mixed-methods evaluations provide unique, additional, and triangulated insights (see also Mertens, 2010; Noar, Palmgreen, & Zimmerman, 2009). Summative research can be conducted both during and after major campaign phases. Indeed, rigorous summative research requires designing-in evaluation activities right from the start, including baseline, ongoing (including usage data for online and interactive activities), end-of-campaign, and longer-term measures. At the individual level, evaluation researchers typically measure exposure and learning as well as effects on attitudes and behaviors. The preponderance of evaluation data suggests that campaigns are capable of exerting moderate to powerful influences on cognitive outcomes, less influence on attitudinal outcomes, and still less influence on behavioral outcomes (Atkin, 2001; Snyder & Hamilton, 2002). Further, behavioral outcomes tend to vary in proportion to such factors as the dose of information, duration of campaign activities, integration of mass and interpersonal communication systems, and integration of social-change strategies (enforcement, education, and engineering).

There are a number of reasons why a campaign does not attain a strong impact. Audience resistance barriers arise at each stage of response, from exposure to behavioral implementation. A major problem is simply reaching the audience and attaining attention to the messages (Hornik, 2002). Audience members are also lost at each subsequent response stage, including misperception of susceptibility to threatened consequences, denial of applicability of message incentives to self, defensive counterarguing against persuasive appeals, rejection of unappealing behavioral recommendations, and sheer inertial lethargy. Effectiveness of public communication campaigns is limited when receivers regard messages as offensive, disturbing, boring, stale, preachy, confusing, irritating, misleading, irrelevant, uninformative, useless, unbelievable, or unmotivating.

Evaluation may also assess the impact of the campaign on policymakers, organizations, and the community level. These outcomes usually involve alterations in environment factors (such as access to health resources, or changes in broader systems) that produce improvements in society (Rice & Foote, 2001). The population-wide consequences are typically examined via evaluation of aggregate changes in behavioral patterns to determine how fluctuations correspond to environmental variations.

Salmon and Murray-Johnson (2001) make distinctions among various types of campaign effectiveness, including *definitional effectiveness* (e.g., getting a social phenomenon defined as a social problem or elevating it on the public agenda), *contextual effectiveness* (e.g., impact within particular contexts such as education vs. enforcement vs. engineering), *cost-effectiveness* comparison (e.g., prevention vs. treatment, addressing certain problems over others), and *programmatic effectiveness* (e.g., testing campaign outcomes relative to stated goals and objectives).

It should be noted that campaign effectiveness is increasingly defined using relative rather than absolute standards. For example, a campaign may be deemed "effective" if it meets the objectives set by its planners. Indeed, some prescriptions for attaining

greater impact suggest that campaign planners set readily attained objectives. This does not improve campaign performance *per se* but it lowers the bar of expectation and, in so doing, increases the odds that the campaign will be viewed as a success.

Direct Effects on Focal Subpopulations

Most campaigns aim messages directly at the *focal segments* – at-risk subpopulations who might benefit from the campaign. The potential for direct effects depends on the relative prevalence of various types of receptiveness among target audience segments. A fundamental receptivity factor is stage of readiness to perform the practice; campaigns typically achieve the strongest impact with triggering or reinforcing messages designed for people who are already favorably predisposed. Another key audience segment includes those who have not yet tried the undesirable behavior but whose background characteristics suggest they are “at risk” in the near future; many may be receptive to persuasive messages. Those committed to unsuitable practices are not readily influenced by directly targeted campaigns, so a heavy investment of resources to induce discontinuation tends to yield a marginal payoff. Among focal targets, there are demographic, social, and psychological-based subgroups such as higher vs. lower income strata, high vs. low sensation-seekers (Palmgreen, Donohew, & Harrington, 2001), those experiencing psychological or social obstacles in accomplishing certain behaviors (Dervin & Frennette, 2001), and members of different cultures (Horner, Romber, Venable et al., 2008).

Indirect Effects on Interpersonal Influencers and Policymakers

A second effects strategy is to initiate an indirect or multistep flow by disseminating messages to potential *interpersonal influencers* who are in a position to personally influence focal individuals (Rogers, 2003). In a third effects strategy, the campaign may seek to alter the environment indirectly by aiming messages at societal and *organizational policymakers* who are responsible for devising constraints and creating opportunities that shape focal individuals’ decisions and behaviors (Wallack & Dorfman, 2001). Rather than relying predominantly on direct persuasion, campaigners may attain greater impact by investing effort and resources in campaign components affecting indirect or secondary target audiences who can (a) exert interpersonal influence on focal individuals or (b) help reform environmental conditions that shape behavior. According to Salmon and Atkin (2003), mass media campaigns have considerable potential for motivating personal influencers in close contact with the focal individuals, as well as producing effects on institutions and groups at the national and community level.

The interpersonal influence process has been demonstrated in numerous projects utilizing the two-step flow from media to opinion leaders, a cornerstone of the

diffusion of innovations model (Rogers, 2003). Campaigns aim at opinion leader audiences because they tend to be more receptive to campaign messages, and their indirectly stimulated activities are more likely to be effective than campaign messages directly targeted to the focal segment. Interpersonal influencers can impact behavior through activities such as dispensing positive and negative reinforcement, exercising control via rulemaking and enforcement, facilitating behavior with reminders at opportune moments, and serving as role models. These types of interpersonal communication provided a significant boost to the media-oriented campaigns in the seminal Stanford heart disease prevention project (Flora, 2001); behavioral impact was greater in a condition where the mediated messages were supplemented by intensive face-to-face instruction and informal interpersonal influence. One key advantage of opinion leadership is that the influencers can customize their messages to the unique needs and values of individuals in a more precise manner than mediated messages.

Valente, Hoffman, Ritt-Olson, Lichtman, and Johnson (2003) showed that first identifying student opinion leaders and then creating groups by assigning students to their nominated leaders was a more effective structuring procedure in a school-based tobacco prevention program than either having a teacher naming the leader and group members, or randomly assigning group members to an opinion leader nominated by students. Students in the first condition had more improved attitudes and self-efficacy, and decreased intention to smoke, compared to the random condition. The effectiveness of social network-oriented media campaigns, typically targeted to friends and family members of the focal individuals to be influenced, is reviewed in the health domain by Abroms and Maibach (2008). Examples of the impact of social agents can be found in HIV prevention interventions (Durantini, Albarracin, Mitchell, Earl, & Gillette, 2006) and parent-child communication about alcohol (Surkan et al., 2003).

Individuals' decisions are strongly shaped by the constraints and opportunities in their societal environment, such as monetary expenses, laws, industry practices, entertainment role models, commercial messages, social forces, and community services. Policymakers in government, business, educational, medical, media, religious, and community organizations can initiate interventions that alter the environment. Thus another means of integrating media and interpersonal communication is to organize campaign activities at the community level, which can engage stakeholders to interface with government agencies, schools, or businesses (Bracht, 2001). Some reformers combine community organizing and media publicity to advance healthy public policies via *media advocacy* (Dorfman, Wallack, & Woodruff, 2005; Wallack & Dorfman, 2001). The media advocacy approach seeks to frame public health issues to emphasize policy-related environmental solutions rather than the usual focus on individual responsibility for good health. Activists generate news media coverage to mobilize the public to influence policymakers to enact reforms to address health problems, particularly relating to smoking and drinking (Dorfman

et al., 2005; Holder & Treno, 1997; Niederdeppe, Farrelly, & Wenter, 2007). Gaining consistent visibility in the news media is a key to achieving an agenda-setting effect, which is particularly important in media advocacy strategies targeted to opinion leaders and policymakers in society.

Through agenda setting on health issues, news coverage can shape the public agenda and the policy agenda pertaining to new initiatives, rules, and laws. An important element involves changing the public's beliefs about the effectiveness of policies and interventions that are advanced, which leads to supportive public opinion (and direct pressure) that can help convince institutional leaders to formulate and implement societal constraints and opportunities. When Freudenberg, Bradley, and Serrano (2009) analyzed a dozen case studies of health campaigns, they found that the most widely used strategies are coalition building, media advocacy, and public mobilization, followed by policy advocacy, community organization, litigation, letter-writing, and public protest. Collaboration with the business sector is rarely used. A common theme is that advertising and promotional campaigns attempt to target vulnerable groups (e.g., youth, minorities, females, low social-economic status segments) in order to gain new markets despite evidence that the product harms health; this provides the rhetorical basis for undertaking initiatives.

Message Types

Messages: Prevention versus Promotion

In influencing behavior, campaigns either attempt to promote positive behaviors (e.g., eat fruit, buckle safety belt, recycle paper) or to prevent problematic behaviors (e.g., consuming fats, driving while intoxicated, burning forests), see Chapter 26. Traditionally, prevention campaigns present fear appeals to focus attention on negative consequences of a detrimental practice, rather than promoting the desirability of a positive alternative. This approach is most potent in cases where harmful outcomes are genuinely threatening, or positive products are insufficiently compelling.

The social marketing perspective is especially applicable to promoting desirable behavior, which involves offering rewarding gains from attractive "products" (such as tasty fruit, the designated driver arrangement, or staircase exercising). In developing behavioral recommendations in promotional campaigns, designers can draw upon an array of options from the "product line." These target responses vary in palatability associated with degree of effort, sacrifice, and monetary expense; a central strategic consideration in determining the degree of difficulty is receptiveness of the focal segment (Kotler, Roberto, & Lee, 2002). The prolonged nature of campaigns enables the use of gradually escalating sequential approaches over a period of months or years.

Message Content: Informational vs. Persuasive

In many campaign situations, informational messages that seek to create awareness or provide instruction play an important role. Awareness messages present relatively simple content that informs people what to do, specifies who should do it, or provides cues about when and where it should be done. Even superficial messages can stimulate the audience to seek out richer in-depth content from elaborated informational resources such as web pages, books, and opinion leaders. The more complex instruction messages present “how to do it” information in campaigns that need to produce knowledge gain or skills acquisition, including enhancing personal efficacy in bolstering peer resistance and acquiring media literacy skills.

However, the central type of message in campaigns is the persuasive appeal. Most campaigns present messages featuring persuasive reasons why the audience should adopt the advocated action or avoid the proscribed behavior. The classic case involves the mechanism of attitude creation or change, usually via knowledge gain and belief formation. For audiences that are favorably inclined, the campaign has the easier persuasive task of reinforcing existing predispositions: strengthening a positive attitude, promoting post-behavior consolidation, and motivating behavioral maintenance over time. Because a lengthy campaign generally disseminates a broad array of persuasive messages, strategists often marshal a variety of appeals built around motivational incentives designed to influence attitudes and behaviors; the selection and organization of persuasive appeals is described in detail in subsequent sections.

Message Features: Qualitative Dimensions

A campaign encompasses a collection of individual messages varying in content, form, and style. Designing these messages involves the strategic selection of substantive material and creative production of stylistic features. In developing the combination of message components, the campaign designer seeks to emphasize one or more of five key message qualities (Salmon & Atkin, 2003). *Credibility* is the extent to which the message content is believed to be accurate and valid, and this qualitative factor is conveyed by the trustworthiness and competence of the source and the provision of convincing evidence. As more campaigns and their messages become accessible online, designers and evaluators need to become more familiar with the growing research on website and online credibility (Metzger, Flanagin, Eyal, Lemus, & McCann, 2003). Second, the style and ideas should be *engaging*, by using stylistic features that are superficially attractive and entertaining (or at least arresting), along with substantive content that is interesting, mentally stimulating, or emotionally arousing. To augment the influence on behavior, the presentation should be personally *relevant*, such that the receivers regard the recommendation as applicable to their situation and needs. Next, the *understandability* of the message contributes

to recipient processing and learning via presentation of material in a comprehensive and comprehensible manner that is simple, explicit, and sufficiently detailed. The final qualitative factor consists of *persuasive incentives*, the motivational appeals which are fundamental to the effectiveness of messages seeking to persuade the audience.

Message Appeals: Persuasive Incentives

Persuasive messages in public communication campaigns utilize a basic expectancy-value mechanism that is incorporated in several popular theoretical frameworks (theory of reasoned action, protection motivation theory, and health belief model). In this conception, messages primarily influence a collection of beliefs regarding the subjective likelihood of each outcome occurring, and attitudinal and behavioral responses are contingent upon each individual's valuation of these outcomes. The operational formula for preventing undesirable behaviors is *vulnerability* x *severity*, positing that the audience is maximally motivated by a high likelihood of suffering a very painful consequence. The incentive appeals often build on existing values of the target audience, so the messages tend to reinforce the predispositions or change beliefs about the likelihood of experiencing consequences.

For campaigns in the health domain, the basic dimensions of incentives include physical health, time/effort, economic, moral, legal, social, psychological, and aspirational aspects. Rather than over-emphasizing the narrow domain of negative health threats (e.g., death, illness, injury), campaigners are increasingly diversifying their loss-framed incentive strategies to include appeals not directly related to physical health *per se* (e.g., psychological regret, social rejection) and to give greater emphasis to gain-framed positive incentives (e.g., valued states or consequences such as physical well-being, saving money, social attractiveness; see Chapter 26, this volume).

One form of diversification of a campaign message mix is to increase the generally modest proportion of gain-framed incentives. Corresponding to certain negative consequences of performing the proscribed practice, there are mirror-image positive outcomes that can be promised. For example, the social dimension of positive social incentives includes gaining approval and respect, forming deeper friendships, building trust with parents, and being a good role model; examples of psychological gains include gaining control over one's life, positive self-image, attaining one's goals, feeling secure, or acting intelligently.

Regarding the number of different incentives, it is generally advantageous to use multiple persuasive appeals across a series of messages in a campaign, particularly when seeking to influence varied audiences. The key criteria for selecting incentives are the salience of the promised or threatened consequences, the malleability of beliefs about the likelihood of experiencing these outcomes, and pretest ratings of the persuasiveness of the potential arguments (see Cappella et al., 2001). These are identified and elaborated during the formative evaluation stage.

In conveying incentive appeals, campaign designers need to provide evidence to support claims made in messages. The type of evidence to be featured varies according to audience segment; for example, those who are knowledgeable tend to be more influenced by messages citing statistics or quoting technical experts, whereas dramatized case examples and testimonials by famous messengers may work better for low-involvement audience members (Perloff, 2003; Reinard, 1988). It should be noted that broad media audiences inevitably vary in predispositions, so special care should be taken when using extreme claims or selective factual information that may strain credulity and trigger counterarguing.

Message Sources

The *messenger* is the presenter appearing in the message who delivers information, demonstrates behavior, or provides a testimonial. Messengers help enhance each qualitative factor by being engaging (attractiveness, likability), credible (trustworthiness, expertise), and relevant to the audience (similarity, familiarity). These attributes can (a) attract attention and facilitate comprehension by personalizing message concepts, (b) elicit positive cognitive responses during processing, (c) heighten emotional arousal via identification or transfer of affect, and (d) increase retention due to memorability. The key categories of public communication campaign messengers are celebrities, public officials, topical expert specialists, professional performers, ordinary people, especially experienced individuals (e.g., victims or beneficiaries), and unique characters (e.g., animated or costumed).

Mediated Communication Channels: Mass and Digital

In disseminating messages, most campaign designers still rely on traditional broadcast and print channels that carry public service messages, entertainment-education placements, and news coverage. Websites carrying prepackaged informational pages have also been a central campaign vehicle since the late 1990s. In the past decade, campaigns have increasingly utilized interactive technology (e.g., blogs and microblogs, CDs and DVDs, tailored messages and websites, computer games, mobile phones).

In assessing each option for channeling campaign messages, myriad advantages and disadvantages can be taken into consideration along a number of communicative dimensions. Atkin and Salmon (2010) discuss channel differences in terms of *reach* (proportion of population exposed to the message), *specializability* (targeting specific subgroups or tailoring to individuals), *intrusiveness* (capacity for commanding atten-

tion), *participation* (active receiver involvement while processing stimulus), *meaning modalities* (array of senses employed in conveying meaning), *personalization* (human-relational nature of source-receiver interaction), *decodability* (mental effort required for processing stimulus), *depth* (channel capacity for conveying detailed and complex content), *credibility* (believability of material conveyed), *agenda setting* (potency of channel for raising salience priority of issues), *accessibility* (ease of placing messages in channel), *economy* (low cost for producing and disseminating stimuli), and *efficiency* (simplicity of arranging message production and dissemination). Channel appropriateness should be determined by the usage patterns of the priority or target audiences and the nature of the message, although compromises are made due to pragmatic factors shaped by resource limitations. Instead of paid TV ads, campaigns may rely on creative publicity techniques for generating news and feature story coverage in print media. Fortunately, certain topics in the health, safety, and environmental domains are considered to be attractive to professionals working at newspapers, women's magazines, TV newscasts, and daytime TV talk shows. The related practice of entertainment-education (Singhal, Cody, Rogers, & Sabido, 2004), which involves embedding campaign topic-related material in entertainment programming, is widely welcomed by media gatekeepers in developing nations; however, campaigners have attained only sporadic access in the US.

Health interventions and campaigns are increasingly emphasizing digital media technologies (Edgar, Noar, & Freimuth, 2007; Parker & Thorson, 2009; Rice & Atkin, 2008). New media offer additional dimensions of campaigning through interactivity, narrowcasting, and tailoring. *Interactivity* has two primary dimensions, direction of communication and level of receiver control over the communication process, which yield four kinds of relationships between the user and the source (monologue, feedback, responsive dialogue, and mutual discourse). Each of these relationships can be associated with specific design features, such as surveys, games, purchasing products or services, email, hyperlinks, and chat rooms. Rimal and Adkins (2003) suggest applying social marketing principles to *narrowcasting* via segmentation and targeting Internet users. *Tailoring* involves designing customized messages that reflect the individual's predispositions and abilities (Kreuter, Farrell, Olevitch, & Brennan, 1999; Noar, Harrington, & Aldrich, 2009). Tailored messages can match the theoretically relevant characteristics of narrowcast audiences, and interactive/individualized feedback facilitates motivation to adopt behaviors. Online-screening questionnaires assess factors such as readiness stage, stylistic tastes, knowledge levels, and current beliefs, and then direct them to narrowly targeted messages. Not only does this approach increase the likelihood of learning and persuasion, but it decreases the possibility of boomerang effects. Using new media in campaigns to foster interactivity, individually tailored messages, and mobile access increases the likelihood of desired outcomes (Strecher, 2007; Ybarra & Bull, 2007).

The Internet has become a major source for online information, discussion, therapy, and access to physicians (Rice, 2006). Online health-related social support groups can increase reported social support, quality of life, and self-efficacy in

managing one's health condition, and decrease reported depression, according to a recent meta-analysis (Rains & Young, 2009). The value of anonymity inherent in web information search and online discussion groups is valuable for private or sensitive topics (e.g., STD/HIV prevention and testing). Portnoy, Scott-Sheldon, Johnson, and Carey's (2008) meta-analysis of 75 randomized controlled health trials involving computer-delivered intervention found improved knowledge, attitudes, intentions, health behaviors, and general health maintenance, across a variety of health domains (addiction/substance use, chronic diseases, nutrition, physical activity, and sexual health). Another meta-analysis of 85 studies using the Internet for health behavior change reported an overall small but significant positive effect, with stronger results for interventions applying theory in general and the theory of planned behavior in particular, those applying behavior change techniques, and those using other communication approaches, especially text messaging (Webb, Joseph, Yardley, & Michie, 2010).

Campaigns may utilize online public service promos, typically in the form of brief banner ad messages or solicitations to click through to a website. However, these messages have severe content capacity limitations, the sponsors have little control over placement of their banner ads, and ads are often blocked by computer software. Paid health promotion ads on social media sites have greater potential for impact because of more prominent placement and more precise targeting. Health PSA spots and long-form video messages attract modest viewership on YouTube, although unhealthy portrayals and parodies are also featured among the mix of messages accessible on this site.

Online mentors can use email to improve interpersonal support over time, such as the Digital Heroes Campaign designed to foster better youth development (Rhodes, Spencer, Saito, & Sipe, 2006). Mobile phones, especially short message service (texting) are well-suited for offering tailored, wide-reaching, interactive and continuing campaign interventions (Fjeldsoe, Marshall, & Miller, 2009). Cole-Lewis and Kershaw's (2010) review found consistent evidence of positive effects of text messaging on behavioral changes, across demographic and national differences.

Blogs serve an important role in linking users with similar information needs and concerns to share their views and experiences, while wikis support collaboration among campaign members. Podcasts can provide relevant audio information (such as social support, variations on the persuasive message, or related health news) to motivated audiences at their convenience (Boulos, Maramba, & Wheeler, 2006). Twitter can be used to provide updates and protocol reminders to campaign-specific followers. However, as with many Internet health information sources, tweets may include considerable misunderstandings or abuse of health information and medicines (Scanfeld, Scanfeld, & Larson, 2010).

Voice response systems, interactive video, DVD and CD-ROM, mobile phones, and computer games can be effective in reaching young people. Lieberman (2001, 2006) recommends that computer-mediated campaigns feature youthful genres, support information seeking, incorporate challenges and goals, use learning-by-doing,

create functional learning environments, and facilitate social interaction. Videogame learning relevant to campaigns includes skill acquisition from interactive games, improved self-efficacy through success in vicarious experiences, and role-playing and modeling. An effective example is the CDC's national VERB campaign designed to promote exercise among preteens; the campaign stimulated heavy traffic on the website and wide-scale engagement in site activities (Bauman et al., 2008; Berkowitz et al., 2008). Baranowski, Buday, Thompson, and Baranowski's (2008) meta-analysis of 25 studies of using videogames to affect health behavior (chronic disease management, exercise, and diet) found improvements in nearly all outcomes.

Quantitative Dissemination Factors

Beyond message qualities, four key quantitative factors are total volume of stimuli disseminated, amount of message repetition, prominence of placement, and scheduling of presentations within one medium or across multiple media (Silk, Atkin, & Salmon, 2011). A substantial *volume* of messages helps attain adequate reach and frequency of exposure, as well as responses such as comprehension, recognition, and image formation. A certain level of *repetition* of specific executions facilitates message comprehension and positive affect toward the recommended behavior, but overly high repetition produces wearout and diminishing returns. The optimum level depends on factors such as the qualities featured in the message execution and complexity of the subject matter.

Placement *prominence* of messages in conspicuous positions within media vehicles (e.g., front-page newspaper positioning, heavily traveled billboard locations, or high-rank search engine websites) serves to enhance both exposure levels and perceived significance of the topic on the public agenda. Depending on the situation, the *scheduling* of a fixed number of presentations may be most effectively concentrated over a short duration, dispersed thinly over a lengthy period, or distributed in intermittent bursts of "flighting" or "pulsing."

To maximize quantity, campaigners seek to gain media access via monetary support from government and industry (to fund paid placements and leveraged media slots), aggressive lobbying for free public service time or space, skillful use of public relations techniques for generating entertainment and journalistic coverage, and reliance on low-cost channels of communication such as websites and social media. Moreover, the reach of a campaign is often boosted by sensitizing audiences to appropriate content already available in the media and by stimulating information seeking from specialized sources.

Regarding the *length* of a campaign, the realities of the unrelenting problems addressed in public communication campaigns usually require exceptional persistence of effort over long periods of time ranging from several months to many years as successive phases of the campaign are implemented. In many cases, perpetual

campaigning is necessary because various focal segments are in constant need of influence: *newcomers* constantly move into the priority audience, *backsliders* occasionally revert to prior misbehavior, *evolvers* take their time in gradually adopting the recommended practice, *vacillators* need regular doses of reinforcement to stay the course, and *latecomers* finally give up bad habits and become receptive to the campaign. In other contexts, such as colleges, each year a new cohort arrives and provides new target audiences for campaigns concerning drinking, drugs, sexual behavior, depression, and other issues, so college campaigns must be continually implemented, formatively and summatively evaluated, and revised (Martell et al., 2006).

Identifying which media the target audience is most likely to use, and at what times, requires access to audience ratings and usage data, as well as an understanding of audience research methods and markets (Webster, Phalen, & Lichty, 2006). New media, such as interactive websites, social media, mobile phones, and virtual reality settings (Ybarra & Bull, 2007) present new challenges and new sources of data.

Example Campaign Focus: Anti-Drug Campaigns

Campaigns to prevent drug abuse have been a fixture in the media for more than a quarter-century, beginning with the “Just Say No” initiative during the Reagan presidency. The initial wave of campaigning occurred between 1985 and 1990, and corresponded with a decline in the use of drugs (particularly cocaine, the focus of the prevention messages in that era). Youth drug-usage tracking surveys in the early and mid-1990s showed a slight but steady upswing, which led to a revival in 1998 of campaigning by the White House Office of National Drug Control Policy (ONDCP, 2010). From the start, the anti-drug campaigns have drawn upon substantial resources to obtain prominent media placements; funds have been allocated by the federal government, and access has been gained via cooperative ventures with the media industry.

Nearly \$1 billion was spent between 1998–2004 on the ONDCP campaign to combat drug use among adolescents in the 9–18 age range, with the key objectives of preventing initiation (especially marijuana and inhalants) and encouraging cessation among occasional users. This comprehensive social marketing effort featured messages targeted to youth, their parents, and other influential adults, disseminated primarily via television and radio, along with websites, magazines, and movie theaters. Ads sought to teach drug resistance skills, promote non-usage norms and positive alternatives (focusing on benefits of not using drugs), and prompt peer intervention; negative consequences played a significant role, but emphasized effects on academic and athletic performance rather than severe health harm.

Tracking studies since 2001 show a slight but steady decline in youth drug usage; two recent correlational studies indicate that youth exposed to anti-drug messages in the media are about one-third less likely to have recently used illicit drugs (notably

marijuana) and to hold stronger anti-drug beliefs (ONDCP, 2010). On the other hand, little impact of the national campaign on marijuana use and related cognitions was found by Hornik et al. (2008), who performed time-series analyses of a large-scale adolescent panel. Indeed, there are some indications of a boomerang effect, and the authors note that the sheer pervasiveness of anti-drug campaign messages may convey an “implicit meta-message” that drug use is prevalent (Hornik et al., 2008).

A more limited time-series analysis of one phase of the ONDCP anti-marijuana campaign in a mid-sized market demonstrated significant effects in lessening marijuana usage, attitudes, and beliefs among adolescents classified as “high sensation-seekers” (Palmgreen, Lorch, Stephenson, Hoyle, & Donohew, 2007). The researchers concluded that this impact was due to the dramatic depiction of negative consequences of marijuana use. Longshore, Ghosh-Dastidar, and Ellickson (2006) report that moderate or high exposure to the media campaign messages in combination with a classroom-based drug prevention curriculum led to a significant reduction in marijuana use among a statewide sample of high school students.

In conclusion, there is mixed evidence about the effectiveness of anti-drug campaigns. The overall pattern indicates that campaigns reduce usage among certain population segments, but the degree of impact is not proportionate to the high quantity of messages. Moreover, persistent portrayals of drugs in prevention messages may contribute to perceptions of a descriptive norm that usage is widespread; normative issues are examined further in the risky drinking campaign example below.

Example Campaign Focus: Antismoking Campaigns

The indirect approach (influencing the focal segments via campaign impact on policymakers) has been successful in the case of antismoking campaigns over the past 20 years. The initial large-scale campaign utilizing the environmental control approach occurred in the state of California, which effectively combated smoking with a coordinated combination of strategies promoting cigarette taxation, restrictions of smoking in public places and sales to minors, and attacks on the tobacco industry to undermine public attitudes toward marketing of cigarettes (Pierce et al., 1998). This was followed by a statewide campaign in Florida featuring the “truth” theme to challenge the industry’s deceitful marketing practices. This campaign also achieved substantial smoking reduction impacts on youth (Sly, Hopkins, Trapido, & Ray, 2001). The “truth” campaign was subsequently carried out nationally by American Legacy Foundation. Tobacco settlement funds provided resources for a wide dissemination of messages, primarily aimed at adolescents. Supplementing traditional strategies that emphasize smoking prevention or cessation appeals, the “truth” message themes featured public demonstrations against the tobacco industry. Studies show increases in anti-tobacco attitudes and substantial declines in youth smoking as a result of this campaign (Farrelly, Davis, Haviland, Messeri, & Healton, 2005). In addition, a survey

of recent quitters showed that anti-tobacco TV spots were the most frequently mentioned source of help, particularly younger former smokers; the most influential ads depicted illness or provided “inspirational” quit tips (Biener et al., 2006).

Two other examples demonstrate the effectiveness of media antismoking campaigns. A time-series tracking over a decade showed that exposure to tobacco control media campaigns significantly reduced smoking rates among adults (Wakefield et al., 2008). Multi-wave analyses by Levy, Mumford, and Compton (2006) showed that media campaigns and higher cigarette taxes led to reduced smoking prevalence among low-income women.

Example Campaign Focus: Risky Drinking Campaigns

A growing number of media campaigns have sought to create or alter public perceptions of social norms regarding the prevalence of unhealthy behaviors such as risky drinking, which is commonly overestimated by key segments of the population. In numerous college communities, media campaigns present statistical information to correct misperceptions about normative drinking levels; preproduction research helps to identify the dimensions of misperception; and pretesting research enables refinement of the messages to heighten understandability and credibility. Summative evaluation research generally supports the effectiveness of social norms campaigns in reducing undergraduate student drinking problems, as demonstrated in a multiple randomized trial of college campuses showing that the perceptions and consumption were lower in intervention locales than control locales (DeJong et al., 2006).

One of the federally funded model projects utilizing the social norms approach has been implemented at Michigan State University (MSU), where an elaborate series of campaign phases has been carried out starting in 2000. Each semester, a significant quantity of messages is disseminated via multiple channels including ads in the campus newspaper, posters displayed across campus, table tents in dining rooms and bars, campus TV and radio spots, a website, and social media. The basic strategy is to correct misperceptions of MSU student drinking behaviors and attitudes, using messages reporting actual survey data representing a variety of descriptive and injunctive norms (e.g., proportion consuming moderate amounts on typical evening of partying, proportion drinking on celebratory occasions such as Halloween and football tailgates, proportion performing protective behaviors such as arranging designated driver or staying with same group all evening, and proportion disapproving of “getting wasted” or pressuring friends to drink). Several outcome evaluation methods have been used, but one key technique is tracking global trends over time; data show a steady downward trend in reported consumption per occasion (from 5.6 drinks at the baseline in 2000 to 4.7 drinks in 2008), increases in protective behaviors,

and decline in experiencing negative consequences of binge drinking (Atkin, Martell, Smith, & Greenmayer, 2004; Martell et al., 2006; Smith & Atkin, 2009).

The MSU campaign also features a major environmental management component that encompasses police enforcement of public disturbance laws, strict ID checks and server intervention in bars, party restrictions by landlords and hosts, limits on location and length of tailgating on football game days, and suspension of students violating laws. These initiatives are promoted with campaign messages aimed at city policymakers, law enforcers, bar owners, involved publics, and drinkers. The message themes highlight evidence of harms to be avoided, marginalization of misbehavers, support for restrictions by constituencies, and warnings about consequences for violators. These control-oriented approaches provide a valuable supplement to the softer norms component of the overall campaign.

An example of environmental reforms at the national level can be seen in a pair of long-running campaigns by the Center for Science in the Public Interest to reduce youth alcohol problems. One campaign seeks to combat marketing of sweetened, high alcohol-concentration beverages ("alcopops") that appeal to young drinkers; limited success has been achieved via federal regulations and limits on local retailers. The second campaign is designed to mobilize college officials to persuade the NCAA to eliminate beer advertising during its televised sports event. The campaign has received the endorsement of hundreds of organizations and colleges, and more than 200 schools agreed to ban alcohol ads from local telecasts of local sports events (Freudenberg et al., 2009).

Conclusion

Most experts conclude that public communication campaigns have attained a modest rather than strong impact, notably in the health domain. This is partially due to meager dissemination budgets, unsophisticated application of theory and models, and poorly conceived strategic approaches. It is also due to the difficulty of the task facing the campaigner, who may be promoting complex or difficult behaviors, targeting resistant audience segments, or coping with limited resources, while at-risk audiences are constantly exposed to media portrayals and advertisements that highlight detrimental behaviors. In these situations, more emphasis should be given to relatively attainable impacts, by aiming at more receptive focal segments, by promoting more palatable positive products perceived to have a favorable benefit-cost ratio, by creatively generating free publicity, and by shifting campaign resources to indirect pathways that facilitate and control behavior of the focal segment via interpersonal, organizational, and societal influences. More generally, the degree of campaign success can be improved via greater diversification of pathways, products, incentives, and channels beyond the approaches conventionally used in public communication campaigns.

Despite the many barriers that diminish campaign effectiveness, the research literature shows many success stories over the past several decades. Health campaigns have made significant contributions to the progress in addressing important problems such as smoking, drunk driving, AIDS, drug use, heart disease, and unprotected vehicle occupants. These domains tend to be characterized by substantial quantity of message dissemination over sustained periods, widespread receptivity to the advocated action and accompanying persuasive incentives, and supplementation of mediated messages by campaign-stimulated factors such as informal interpersonal influences and social engineering policy initiatives. With the increasing adoption of sophisticated strategies and the rising priority of healthy and prosocial practices for individuals and society, there is a sound basis for optimism that campaigns can produce stronger impacts in the future.

Effects of Social Marketing

Potential and Limitations

Michael D. Basil

ABSTRACT

Many efforts to improve people's health behaviors have employed communication campaigns. A related approach, but more extensive, termed "social marketing," applies commercial marketing methods to health and other social goals by trying to shape people's behaviors through facilitation and reward. Social marketing is limited by existing beliefs, social forces and other structural factors, and to the extent that we cannot develop viable products or solutions, it cannot really be employed. A review of research suggests that social marketing is used in different ways around the world. This evidence, as well as the primary research of the chapter author, suggests that social marketing is most effective when it goes beyond information and fear to find ways to make the performance of those behaviors easier, when it finds ways to fit within the context of existing beliefs and finds ways to work out solutions that are amenable to the range of consumers and constituents.

Communication and Information Campaigns

Many efforts to improve people's health behaviors have employed communication campaigns. Most typically this has involved the use of the mass media and other forms of communication to promote health behaviors (see Chapter 24, this volume). The historical basis of this approach can be traced to "information campaigns" in the 1940s

(Hyman & Sheatsley, 1947). Over the next few years many communication and public health practitioners have continued to focus on “information campaigns” and examined their power in influencing human behavior, especially in the realm of health (Mendelsohn, 1973). The general strategy underlying this approach is that when people are given appropriate information, they can make better decisions. A good many studies have examined the effects of these campaigns. A couple of recent meta-analyses of health communication campaigns have examined these health campaigns and concluded that information campaigns are generally effective in altering knowledge but not very effective in shaping behaviors (Keller & Lehmann, 2008; Snyder et al., 2004). That is, people learn some information, but only sometimes do they take action.

My own background has parallels with the story here. With an educational background in psychology and communication, it was easy and natural to draw on information theories to attempt to influence people’s health behavior. The persuasion orientation can be seen in literature in information campaigns and in cognitive psychology. But as I became involved in working in the area of health, often with “health education specialists,” I became aware that convincing people of possible negative consequences of products such as tobacco often was insufficient to motivate action. In many cases educational efforts competed with campaigns that were based on needs and motivations which targeted people of different ages, ethnicities, and races (Altman, Schooler, & Basil, 1991; Basil et al., 1991). For example, tobacco ads ignored health issues such as cancer and emphysema to focus on more immediately tangible social benefits such as attractiveness and popularity (Schooler, Basil, & Altman, 1996).

Another important issue underlying the success of social marketing efforts is the difficulty of remaining, in the face of dozens of competing health messages and health risks, as they say in public relations, “on message.” For example, as a result of the competing tobacco messages, people seem to have combined the arguments to conclude that smoking could make them attractive, popular, and thin, after which they might die, but many believing this would mean a fast and easy death. The health data do not support the easy death assertion, though, and the lack of response to this conclusion was a problem that was never adequately addressed. Similarly, my own research has examined how social agencies fighting over whether abstinence or condoms offered the best approach to the HIV issue, sidetracked and interfered with HIV prevention efforts for many years (Basil, 2008). Eventually, churches and public health agencies agreed to compromise on the use of a combined “ABC” approach, which allowed health prevention efforts to get back “on message” and return their efforts to attempts to combat HIV infection.

Fear Appeals

In addition to information campaigns, a parallel line of theory and research is in the area of fear or threat appeals. Fear is an intuitive approach that can be traced

back as far as information campaigns (Janis & Feshbach, 1953). The general strategy underlying this approach is that when people are more cognizant of the risks they face this should result in higher involvement with the issue, which would result in taking action (Roser & Thompson, 1999). A considerable body of research in this area has also shown that a threat does not necessarily equate to fear, and fear does not necessarily result in the most appropriate action (Rogers, 1975; Witte, 1994; Witte & Allen, 2000). That is, people learn what to be afraid of, but do not necessarily change their behavior in response. Sometimes the action they take is to “bury their head in the sand” to avoid exposure to additional fear appeals (Witte, 1992). In addition to limited effects, another problem with the use of fear appeals is the ethics of scaring people or reminding them of tragedies in their lives (Benet, Pitts, & LaTour, 1993; Hastings, Stead, & Webb, 2004; Jones & Rossiter, 2002). Overall then, the effects of fear appeals are limited and ethically concerning.

Although it is the opinion of this author that fear appeals are limited in their effectiveness and overworked, there are some circumstances when they can be effective. The protection motivation model (Rogers, 1975) and the extended parallel process model (Witte, 1992) predict that not only is the level of fear important, but so is people’s confidence, or efficacy, towards being able to enact a protective behavior. Supportive of those predictions, my own research, with colleagues, is finding that fear appeals are more effective when they include ways to enhance self-efficacy and response efficacy with specific behavioral options (Basil et al., 2007). This research demonstrates that when fear appeals also provide simple behaviors that can reduce the threat, these messages result in much higher behavioral intentions.

Personalization

As I was becoming disenfranchised with information-based approaches, AIDS was becoming one of the most important health issues of the day. On a November day in 1991, I, along with millions of people, learned that “Magic” Johnson was diagnosed with HIV and was retiring from basketball. Bill Brown, who was a colleague and a basketball fan, and I were convinced that Magic would make a remarkable spokesperson. We tried to explain to each other why we felt that way. There were many reasons to suspect that celebrities could be powerful, the foremost being Horton and Wohl’s (1956) theory of parasocial identification. Celebrities are people with whom millions of people develop a false sense of personal friendship. This is one of the reasons that celebrities are used frequently in commercial advertising (Alperstein, 1991; Erdogan, Baker, & Tagg, 2001). In addition, as former students of Ev Rogers, we were aware of a large body of “diffusion” research which has shown that friends and similar (“homophilous”) others are much more powerful influences than unknown (“heterophilous”) others (Rogers, 1995).

Armed with these theories of celebrity effects, including Bill's dissertation on parasocial identification (Brown, 1991), we quickly put together a survey and experiment to examine if this was true. The results were remarkably strong – parasocial identification, or a feeling of being close to “Magic” Johnson, was a very large predictor of news diffusion as well as attitudinal changes such as attitudes toward HIV and behavioral intentions to use condoms in future sexual encounters (Basil & Brown, 1994; Brown & Basil, 1995). In fact, the effects were so strong they remained a year later (Basil, 1996). Concern about a friend, virtual or not, is more powerful than simple knowledge of risk factors (Basil & Brown, 1997), and celebrities are people with whom millions of people develop a false sense of personal friendship, which appears to explain their power.

After having discovered the importance of celebrities through Magic Johnson, in subsequent studies we found similar effects for baseball player Mark McGwire (Brown, Basil, & Bocarnea, 2003a), and – although outside the scope of health-related outcomes, *per se* – Diana, Princess of Wales (Brown, Basil, & Bocarnea, 2003b). In the case of Mark McGwire, identification with him predicted attitudes toward child abuse and interest in steroids. For Princess Diana, identification predicted intentions just after her death to watch the funeral on TV and to blame the press for her passing. So friends, whether real or virtual, are an important way to make an issue feel “personalized.”

Social Marketing

Given the often limited behavioral outcomes of information and fear campaigns, another more extensive strategy that is increasingly applied to health communication efforts is the use of “social marketing.” Social marketing applies commercial marketing methods to health issues and other social goals (Andreasen, 2006). In the same way that commercial marketing focuses on sales, the social marketing approach is all about *behavior*, with a focus on finding ways to facilitate and reward those behaviors.

Social marketing has been applied to a number of issues, with some evidence that the approach was first applied in Asia to health issues such as the distribution of condoms (Harvey, 1999). Research supports the notion that general “calls to action” without additional incentives often result in little or no behavioral change, thus supporting the potential power of social marketing (Rothschild, 1999). Social marketing efforts that increase incentives, better accessibility to products such as condoms or mosquito nets, or provide additional value to the target market should be more effective in producing behavior change than information-only efforts (Rothschild, 2009; Smith, 2009).

The main strategy to successful social marketing is to provide direct exchanges to consumers based on their needs and wants. For example, providing attractive

protection appropriate to the person, such as hard hats promoting their favorite football team, is an example of an exchange. This is rooted in economic exchange theory, which explains that people will act if they perceive they are receiving something of adequate value in return (Rothschild, 1999). How do marketers find those potential exchanges that are attractive to consumers? Social marketing draws on several tools from marketing strategy such as consumer analysis, segmenting, targeting, branding, and positioning. Current social marketing generally puts a great deal of emphasis on identification of consumer segments and targeting. The use of segmentation and targeting tools does not necessarily result in social marketing however, as these tools are also used in a number of campaigns that only focus on education or fear (e.g., Bellows, Anderson, Gould, & Auld, 2008; Berkowitz et al., 2008). So segmentation and targeting tools are a necessary, but not a sufficient condition, for a social marketing effort.

What else is needed to make a “social marketing” and not a communication campaign? In commercial marketing, before a promotion occurs, the current selection of products, their price, and their availability are examined and customers’ use and satisfaction with these products is analyzed. To be effective, social marketing campaigns need to take efforts to improve the products and their variety, reduce the costs to consumers, and increase the product’s availability. For example, in one attempt to reduce drunk driving, used limousines were purchased and used to transport people to and from bars where they would be drinking (Rothschild, Mastin, & Miller, 2006). When done correctly the communication component is only applied later, largely to provide awareness of the product or service; and sometimes mass communication may not even be necessary if the marketing program can grow organically using word-of-mouth communication to disseminate awareness of the program.

Theorists suggest that communication efforts work best when they constitute an integrated part of an overall marketing effort (Alden, Basil, & Deshpande, 2011). A focus on communication as the sole basis of social marketing is almost always a mistake – social marketing is not a matter of finding the right way to *say* something so much as it is a matter of understanding a problem, finding a feasible solution, and providing an effective and practical solution to people.

Although many in the health field focus on education or fear campaigns about nutrition, and nutrition is important to many consumers, so are taste, cost, and convenience (Glanz, Basil, Maibach, Goldberg, & Snyder, 1998). So although people can make use of nutrition labels (Basil, Basil, & Deshpande, 2009), these information-focused approaches are missing the important human behavioral factors of taste, convenience, price, culture, and habit. Similarly, although cognitive models such as the health belief model, which examines people’s rational and intentional behavior can be used to predict food choices (Deshpande, Basil, & Basil, 2009), there are other factors that come into play, such as taste, emotion, culture, and habit. Social marketing efforts need to realize that people have already discovered foods that are tasty, convenient, and inexpensive. So instead of just suggesting that people “eat healthy,” taste-testing, recipe-development, and availability of specific options should all be

used to ensure that specific suggestions can be offered which are tasty, convenient, inexpensive, *and* nutritious.

The importance of a behavior being relatively easy to perform can be seen in dog waste bags. By providing doggie bags at the entrance to parks and such, dog owners are encouraged to pick up after their pet. So can the behavior be explained by a lack of knowledge or a lack of fear? Given the ease with which doggie bags were adopted, this is not very tenable. Instead, there is good reason to believe that the additional appeal and convenience of doggie bags can explain this phenomenon. What can we learn from this example? Finding ways to make doggie bags more available to people is critical. After these efforts are in place, communication efforts can then be used to promote these doggie bags, though in many cases this may not be necessary at all.

As I train more and more public health practioners in social marketing I become more convinced that, in order to be effective, we need to widen our approach beyond education and fear-based campaigns. Although communication is an important aspect of social marketing, to qualify as “marketing” it needs to do more by finding easy, practical, and simple solutions for people and then communicate those options to people through integrated efforts (Alden et al., 2011).

Potential

The potential of using the media for social marketing is greatest when behaviors are relatively easy. The potential is also greater when behaviors are not just encouraged, but facilitated and rewarded. In other words, making a behavior easier to perform is usually more effective than simply providing information about the problem and solution (Kotler & Roberto, 1989). The focus on behavioral approaches can be seen in a variety of social marketing efforts such as in promoting the use of bicycle helmets where efforts may involve a bike event to raise awareness, or a contest which gives away a few bike helmets (to increase their desirability) and bike helmet coupons (decrease the price and make them more attractive in the short term; e.g., Alden et al., 2011). Some have recently suggested that social marketing also works best when products that help people to perform the desired behavior are created for the target markets (Rothschild, 2009; Smith, 2009). So if the behavior can be made easier to perform, this should also increase the likelihood of compliance.

Consider, for the point of illustration, the obesity issue. Research evidence demonstrates a rising incidence of overweight and obesity (see Chapter 15, this volume). Research also demonstrates the epidemiological connection between overweight, obesity and health risks. Based on these findings, governments have decided it is important to act. So they try to convince people to avoid being overweight by becoming more active. These types of information campaigns are often where the efforts stop. People learn that to lose weight they should be more active but find it difficult for a variety of very real reasons. Perhaps they become frustrated with their own

efforts and limited success. That's when the marketing efforts kick in. Commercial enterprises use this opportunity to create or expand their fitness facilities and make them more available by opening newer or more convenient locations, opening for longer hours (some are available 24 hours a day), or offering more attractive services (such as swimming pools and babysitting). They may offer assessment and training services so users are not as intimidated by the equipment. They promote these facilities with media advertising or direct mail offering low or free introductory memberships to enroll people in these facilities and make them financially viable.

A good social marketing program not only finds out what people are doing, but what the barriers are, and then finds ways to encourage behaviors at minimal cost or effort before launching communication efforts. Examples of good government and NGO efforts in the area of physical activity can be found in a variety of efforts to promote walking and taking the stairs (e.g., Reger et al., 2002). To be successful, social marketing needs to go beyond providing information or fear to providing solutions. Efforts may include getting older people to walk together and opening shopping malls to help mitigate concerns about weather and safety. These are examples of how social marketing can go beyond merely providing information to providing actionable solutions.

In support of the importance of actionable solutions, a meta-analysis of condom distribution programs demonstrated that it was not an increase in awareness of condoms that made the programs successful, but the increased distribution and availability of the condoms (Cohen et al., 1999). Similarly, in a study of bicycle helmet use, it was not increased awareness, but coupons that lowered prices that increased compliance (Ludwig, Buchholz, & Clarke, 2005). Another effort, mentioned earlier, demonstrated that it was not increased awareness of drunk driving, but the provision of rides to drinkers that was responsible for a decrease in drunk driving (Rothschild et al., 2006). In summary, social marketing efforts that introduce new products, lower the costs, or increase the availability demonstrate more behavioral effects than information-only efforts.

Limitations

Despite the promise offered by social marketing, as in commercial marketing, intervention efforts are limited by competition. In commercial marketing, despite billions of dollars spent on advertising to promote products, a majority of new products fail, largely because of competition. In social marketing, competition can consist of people's existing behaviors, beliefs, social forces, or structural factors that stand in the way. In both commercial and social marketing, people are naturally resistant to new ideas and it is only those ideas or products that strike a chord with consumers by providing considerable value for the price that the new product or behavior has any chance for success over the competition.

Education and information efforts can be effective to the extent that the problem is a lack of knowledge. In most of the world the notion that gaining weight comes from eating more calories than one burns, that fruit and vegetables are healthy, that physical activity has a variety of health benefits, and that reducing one's exposure to environmental toxins reduces risk for cancer are all well-known. What is hard is providing a *means* for people to achieve these ends. For example, finding a way to provide fruits and vegetables to satisfy people's hunger in a way that is as tasty, convenient, and as inexpensive as unhealthy foods is difficult. Imagine the difficulty of reducing your exposure to environmental toxins, if your current home is near a powerline or your basement emits radon gas – you would need to sell your home (possibly at a loss, since the hazard is now known), move, and locate a home that would have fewer environmental risks from those factors (and others). Who can know what all these factors are? To the extent that we cannot develop viable products or solutions, social marketing efforts are, like many communication campaigns, probably limited to raising awareness of a problem or issue.

Review of Previous Studies

In this section, the assertions about the power and limitations of social marketing will be examined in a review of research in social marketing interventions from around the world. This review demonstrates how important it is to provide more than just information, but to provide effective interventions with products that are affordable and easy to use.

The general approach to social marketing is very different in different parts of the world. In what we often term the “developed world,” largely English-speaking countries such as the United States, Canada, the United Kingdom, and Australia, many efforts labelled as “social marketing” tend to consist of information and fear appeals. This can be seen across a range of social marketing interventions. These include alcohol use (DeJong et al., 2006; Gomberg, Schneider, & DeJong, 2001), food choice (Bellows, Cole, & Gabel, 2005; Reger, Wootan, Booth-Butterfield, & Smith, 1998), physical activity (Bauman, Bellew, Owen, & Vita, 2001; Bellows et al., 2008; Berkowitz et al., 2008; Hillsdon, Cavill, Nanchahal, Diamond, & White, 2001; Huhman et al., 2005, 2007; Huhman, Bauman, & Bowles, 2008), sexually transmitted diseases (Ahrens et al., 2006; Bull et al., 2008; Darrow & Biersteker, 2008; Futterman et al., 2001; Kennedy, Mizuno, Seals, Myllyluoma, & Weeks-Norton, 2000; Montoya et al., 2005; Plant et al., 2008), and tobacco use (Dietz, Delva Woolley, & Russello, 2008; Hersey et al., 2003). For almost all of these interventions, the entire effort was built around informational messages that simply provided information to the target audiences.

When examining the effects of these campaigns, the results are similar to what was found with other information and fear campaigns, specifically that most efforts demonstrate change in knowledge or awareness (e.g., Dietz et al., 2008; Hersey

et al., 2003; Huhman et al., 2008). Similarly, social norms campaigns often report a decrease in people's estimates of how prevalent an undesirable behavior is in others (e.g., Davis et al., 2007; DeJong et al., 2006; Gomber et al., 2001), but with regard to actual behavioral outcomes, the effects of these efforts are otherwise limited. A few studies have demonstrated that people will perform a behavior that is relatively simple or cost-free, such as getting a free STD test (Futerman et al., 2001), switching from high- to low-fat milk (Reger et al., 1998), or wearing a condom (Kennedy et al., 2000). In other cases any effects were limited to those populations who reported greater awareness of the campaign, which suggests that information was a helpful but insufficient condition for behavior change (Huhman et al., 2007; Montoya et al., 2005; Plant et al., 2008). For the majority of these attempts, however, the efforts resulted in no significant changes in behavior (e.g., Bull et al., 2008; Darrow & Biersteker, 2008; Dietz et al., 2008; Hersey et al., 2003; Huhman et al., 2008).

In the case of social marketing efforts focused on the "developing world," the efforts are often more varied. Of course there are some programs that use communication-only campaigns. These can be seen in efforts to alter behaviors such as antibiotic use (Goossens et al., 2006), condom use (Meekers, Agha, & Klein, 2005), and multivitamin use (Warnick et al., 2004). However, many social marketing efforts are based on marketing efforts that include increasing the availability of products such as condoms (Eloundou-Enyengue, Meekers, & Calves, 2005; Foss, Hossain, Vickerman, & Watts, 2007) or mosquito netting (Abdulla et al., 2001; Minja et al., 2001; Schellenberg et al., 2001). In these cases, the effectiveness of these approaches is measured in terms such as product ownership (Minja et al., 2001) or product use (Abdulla et al., 2001; Eloundou-Enyengue et al., 2005; Foss et al., 2007; Warnick et al., 2004). The most impressive efforts often show measureable differences in blood markers such as haemoglobin, prevalence of anemia (e.g., Abdulla et al., 2001), and even measures such as infant survival (Schellenberg et al., 2001). In these cases, increasing the availability of condoms or mosquito netting and providing them at affordable prices resulted in efforts that were not only effective in changing knowledge and attitudes, but behavior that resulted in meaningful measures of population health.

Conclusions

Evidence supports the notion that social marketing is most effective when it goes beyond education to provide simple behavioral alternatives, and when these options are consistent with individual beliefs and social forces. In the same way that commercial marketers bring products to the market such as fitness facilities or fruits and vegetables, finding ways to make products more accessible is a critical part of social marketing. As commercial marketers use coupons to reduce the cost of a product, social marketing interventions should also find ways to increase availability and lower price to encourage and shape desired behaviors.

The evidence suggests that the effects of social marketing are limited when focused solely on fear. Fear can cause people to bury their head in the sand and avoid additional messages (e.g., Witte, 1992). Adding easy and simple ways that people can protect themselves is more effective than focusing on fear itself (e.g., Witte & Allen, 2000). The evidence suggests that the effects of these efforts are limited by competing forces such as the cost and difficulty of safety gear. It is difficult to overcome inertia. It is also difficult when different parties act at cross-purposes, such as in the example in which churches and public health agencies fought as to whether abstinence or condoms should be the target, and distracted from the goal of AIDS prevention (Basil, 2008).

This chapter has proposed that social marketing has its greatest potential when it is not limited to information and fear but finds ways to make the performance of desired behaviors easier, when it finds ways to fit those behaviors within the context of existing beliefs, and finds ways to work out solutions that are amenable to a variety of consumers and constituents. Conversely, this chapter has also shown that social marketing is limited by existing beliefs, social forces, and other structural factors. As a result, social marketing is most effective when we can develop viable products or solutions that help people find alternative behaviors that are relatively easy to perform, such as wearing a condom, using mosquito netting to reduce malaria, or getting an inoculation to prevent disease.

Some of the desire to rely on appeals or interventions that focus on information and fear are likely to be as a result of habit, funding and mandates. The idea of shaping behavior can be seen as too coercive, so funding organizations, government agencies, and NGOs are often more comfortable with familiar education campaigns and fear appeals (Smith, Brugha, & Zwi, 2001). As a result, it is important to figure out a solution that is amenable to all constituencies. The social marketing approach requires finding those potential common solutions and employing methods of shaping behavior. As people become more aware of the potential of social marketing we hope they will be more likely to employ it to encourage positive change in health and social behaviors.

Using Message Framing in Health-Related Persuasion

Theory and Evidence

Xiaoli Nan

ABSTRACT

This chapter provides a review of theory and evidence concerning the relative persuasiveness of gain- versus loss-framed messages in health contexts, with particular attention to research surrounding proposed moderators of message framing effects, including type of health behavior advocated, message recipients' involvement with the health issue and approach/avoidance tendency, and desirability of the end-state emphasized in the message. The review suggests that several theoretical perspectives including prospect theory, dual-process theories, and regulatory focus theory have been used to explain message framing effects. It is argued that there has been a lack of effort to integrate the different theoretical perspectives into a broader framework based on which the relative effects of message framing can be understood. The chapter concludes with an assessment of the current state of research and directions for future studies.

Defining Message Framing

Developing effective messages is central to the planning of public communication campaigns (see Chapter 24, this volume). Many communication campaigns address public health issues. One of the most important aspects of designing health messages

The International Encyclopedia of Media Studies, First Edition.

is to determine how to present information in a way that achieves maximum persuasive impact. Research on message framing conducted in the past fifteen years or so has shown that factually equivalent information, when presented in different formats, can lead to different persuasive outcomes. Gain-framed health messages that focus on the advantages of adopting the recommended behavior (e.g., “if you apply sunscreen, your skin will be protected from the sun’s relentless ultraviolet rays”) can differ systematically in their persuasiveness from loss-framed messages that emphasize the disadvantages of not engaging in the health behavior (e.g., “if you don’t apply sunscreen, your skin will be harmed by the sun’s relentless ultraviolet rays”).

However, there is no general agreement as to which message frame is consistently more persuasive. The relative persuasiveness of gain- versus loss-framed health messages appears to be influenced by an array of message- and audience-related factors, including the type of health behavior advocated (Rothman & Salovey, 1997), message recipients’ involvement with the health issue (Maheswaran & Meyers-Levy, 1990), message recipients’ approach/avoidance tendency (Mann, Sherman, & Updegraff, 2004; Nan, 2008), and desirability of the end-state emphasized in the message (Lee & Aaker, 2004; Nan, 2007a). This chapter will provide a review of theory and evidence surrounding each of these factors as moderators of message framing effects and conclude with an assessment of the current state of research and directions for future studies. Practical implications and social significance of this body of research are also briefly discussed.

Framing is an important construct in communication research. The notion that how information is framed systematically influences message processing and attitude formation has spawned several streams of research with distinct operationalizations of framing. Research on *attribute framing*, for example, examines the persuasive effects of focusing on the positive versus negative attribute of an advocated position or object. For instance, an advertisement for a brand of ground beef can either focus on the positive attribute (e.g., “75% lean”) or highlight the negative attribute (e.g., “25% fat”). Typically, messages with positive attribute framing receive better evaluations and are more persuasive than those with negative attribute framing (Levin & Gaeth, 1988). Another type of commonly studied framing is *news framing*, which is often examined in the context of political communication (see Chapter 3). On the subject of healthcare, for instance, a news story can frame it as an ethical issue versus a material issue (Shah, Domke, & Wackman, 1996) or use a thematic frame that focuses on collective trends versus an episodic frame that highlights personal experiences (Iyengar, 1990). The use of different news frames often leads to distinct cognitive processing and attitudes (Scheufele, 1999).

Message framing as reviewed in this chapter shares similarities with other types of framing but also has its distinct features. The three types of framing (i.e., attribute framing, news framing, and message framing) share an important feature in that they all involve subtle language alteration of some sort. But they also have significant differences. First, the three types of framing are different in whether the frames try to maintain factually equivalent information. In this regard, message framing and

attribute framing are similar in that the frames contain factually equivalent information. News framing, on the other hand, does not share this feature as different news frames typically convey different information (e.g., ethical topics are factually different from material topics). Second, message framing and attribute framing are different in their operationalizations. In message framing, both gain and loss frames supply reasons why people should comply with the advocacy. In attribute framing, however, a positive frame stresses the fact that the advocacy is good (e.g., the beef is 75% lean), whereas a negative frame highlights the fact that the advocacy is bad (e.g., the beef is 25% fat), although the intention is really to show how people should dismiss this fact (e.g., the beef has *only* 25% fat).

Differences in framing operationalizations imply that the underlying psychological mechanisms through which framing influences persuasion may be different. For attribute framing, it has been suggested that focusing on the negative attribute of an object leads to activations of unfavorable associations, whereas highlighting the positive attribute activates favorable associations (Levin & Gaeth, 1988). Positive attribute framing, therefore, is often more persuasive than negative attribute framing. The effects of news framing are also grounded in the activation of different thoughts and associations (Pan & Kosicki, 1993; Price & Tewksbury, 1997). Depending on the nature of the thoughts and associations activated (positive or negative), different news frames can result in different attitudes.

Compared to attribute framing and news framing, message framing appears to work through different psychological mechanisms. Examining the moderators of the relative persuasiveness of gain- versus loss-framed messages reveals important psychological processes at work. But first, a review of the original body of research that inspired investigations of message framing is necessary.

The Origins of Message Framing

Research on message framing is rooted in the Nobel Prize-winning work of economists Amos Tversky and Daniel Kahneman. Classic economic theories assume that human beings are rational. People's preferences, therefore, should not be affected by variations in irrelevant features of options or outcomes. However, this assumption was challenged by Tversky and Kahneman, who demonstrate that preferences are influenced by how the options are framed, a seemingly irrelevant feature (Tversky & Kahneman, 1981). Specifically, an individual's preference for a solution that will lead to an uncertain outcome (i.e., a risky solution) versus one that will result in a certain outcome (i.e., a non-risky solution) is predictably influenced by the framing of the outcome (Kahneman & Tversky, 1979). In one of their studies (Tversky & Kahneman, 1981), participants were asked to imagine a disease that would kill 600 people. They were then asked to choose between two plans that could alleviate the situation. Plan A had a certain outcome and thus was a non-risky solution, whereas

Plan B had an uncertain outcome and thus was a risky choice. Plan A was either gain-framed (“if Plan A is adopted, 200 people will be saved”) or loss-framed with an equivalent outcome (“if Plan A is adopted, 400 people will die”). Similarly, Plan B was either gain-framed (“if Plan B is adopted, there is a one-third probability that 600 people will be saved and a two-thirds probability that no people will be saved”) or loss-framed with an equivalent outcome (“if Plan B is adopted, there is a one-third probability that nobody will die and a two-thirds probability that 600 people will die”). The most interesting finding was that when facing the gain-framed plans, participants preferred the non-risky solution (i.e., Plan A), but when facing the loss-framed plans, they preferred the risky solution (i.e., Plan B).

Tversky and Kahneman explained the findings with prospect theory, which posits that the observed preference reversal is due to different value functions that are associated with decision-making involving gains versus losses. Specifically, the value function in the domain of gains is typically concave, representing a tendency for being risk averse, while the value function in the domain of losses is convex, suggesting a tendency for being risk-seeking. The theory also postulates that people have a greater tendency to avoid a loss than to seek a gain with the same amount of expected value. For example, avoiding losing one hundred dollars in a gambling game may be perceived as being more important than winning one hundred dollars. This claim is represented by a steeper value function in the domain of losses than in the domain of gains.

Research on Message Framing: An Overview

Inspired by framing effects observed in the domain of decision-making, persuasive communication researchers explore whether similar framing effects can be observed in the area of persuasion. Instead of focusing on people’s choice behaviors under the influence of framing, persuasive communication researchers examine whether people’s compliance with a persuasive message is affected by how the message is framed. The majority of studies on message framing have been conducted in health-related contexts.

A seminal study on message framing effects was Meyerowitz and Chaiken’s (1987) inquiry on women’s compliance with a health message encouraging the performance of breast self-examination (BSE). The researchers showed two groups of female participants two different versions of the health message. One version of the health message was gain-framed (e.g., “research shows that women who do BSE have an increased chance of finding a tumor in the early, more treatable stage of the disease”), while the other version was loss-framed (e.g., “research shows that women who do not do BSE have a decreased chance of finding a tumor in the early, more treatable stage of the disease”). It was found that participants who read the loss-framed message manifested more positive BSE attitudes, intentions, and behaviors than those who read the gain-framed message.

Following Meyerowitz and Chaiken's (1987) original research, numerous studies have investigated the relative persuasiveness of gain- versus loss-framed messages. In a recent meta-analysis, O'Keefe and Jensen (2006) identified over a hundred published articles, dissertations, and conference papers reporting findings on message framing effects. Despite the abundance of research, there is no general consensus as to whether one frame is more persuasive than the other. In fact, O'Keefe and Jensen's (2006) meta-analysis concludes that gain- and loss-framed messages do not generally differ in their persuasiveness. The lack of a main effect of message framing indicates two possibilities, (1) gain- and loss-framed messages truly do not have differential persuasive effects, (2) the two frames do exert different persuasive impact, with one frame being more persuasive under certain circumstances and the other frame being more effective under other situations. In the latter case, the meta-analysis would not be able to detect an overall effect of message framing because the opposing effects of message framing observed in different studies could have been cancelled out.

It appears that the second possibility is a promising one as research has shown that gain- and loss-framed messages do differ systematically in their persuasiveness when certain conditions are met. Indeed, a number of moderators in the relative persuasiveness of gain- versus loss-framed messages have been identified. These include the type of health behavior (Rothman & Salovey, 1997), issue involvement (Maheswaran & Meyers-Levy, 1990), approach/avoidance motivation (Mann et al., 2004; Nan, 2008), and desirability of end-states (Lee & Aaker, 2004; Nan, 2007a). The next section provides a review of research on each of these moderators, focusing on both theory and evidence.

Moderators of Message Framing Effects

Type of Health Behavior

According to Rothman and his colleagues (Rothman, Kelly, Hertel, & Salovey, 2003; Rothman & Salovey, 1997), health behaviors can be categorized into three broad classes. *Detection behaviors* are performed to provide information about the presence or absence of a potential undesirable health outcome. *Prevention behaviors* focus on averting the onset or development of a health problem. Finally, *recuperative behaviors* are any interventions undertaken to correct or alleviate an existing health problem. Drawing upon prospect theory (Kahneman & Tversky, 1979), the researchers argue that, "the effect of a particular frame on people's willingness to perform a behavior is contingent on whether the option under consideration is perceived to reflect a risk-averse or risk-seeking course of action" (Rothman et al., 2003, p. 281). Because detection behaviors can inform people that they may be sick, to initiate the behavior can be considered a risky decision. It then follows that loss frames will be more effective in promoting detection behaviors than gain frames. On the other hand,

because prevention and recuperative behaviors forestall or help the recovery of a health problem, they provide a relatively certain, desirable outcome. Thus, gain frames are expected to be more effective in promoting prevention and recuperative behaviors than loss frames.

Several studies have shown that loss-framed messages are more persuasive than gain-framed messages in promoting detection behaviors, including breast self-examination (e.g., Meyerowitz & Chaiken, 1987), mammography (e.g., Cox & Cox, 2001; Finney & Iannotti, 2002), and colorectal cancer screening (e.g., Myers et al., 1991). While no study has found gain-framed messages to be more effective than loss-framed messages in advocating cancer-screening behaviors (Rothman, Bartels, Wlaschin, & Salovey, 2006), a number of studies failed to detect any persuasive difference between the two frames (e.g., Lalor & Hailey, 1990; Lauver & Rubin, 1990). A recent meta-analysis (O'Keefe & Jensen, 2009) showed that loss-framed messages are slightly more effective than gain-framed messages in promoting detection behaviors, although the advantage of loss-framed messages over gain-framed messages was mainly found for breast cancer detection behaviors.

With regard to prevention behaviors, several studies have shown that gain-framed messages are more effective than loss-framed messages in promoting such behaviors, including sunscreen use (e.g., Rothman, Martino, Bedell, Detweiler, & Salovey, 1999; Rothman, Salovey, Antone, Keough, & Martin, 1993), exercise (e.g., Jones, Sinclair, & Courneya, 2003), and safe driving (e.g., Millar & Millar, 2000). A meta-analysis (O'Keefe & Jensen, 2007) indicates that gain-framed messages have a small advantage over loss-framed messages in advocating prevention behaviors, although the advantage primarily occurs for messages promoting dental hygiene behaviors.

Overall, Rothman and colleagues' prospect theory-based explanation of message framing effects provides a reasonable account for the observed evidence. In addition, the notions that gain frames work better for promoting prevention behaviors and that loss frames are more effective when advocating detection behaviors offer a useful conceptual map to health professionals when they make decisions about the type of information to be emphasized in a health message. However, their prediction that gain frames will be more effective than loss frames in promoting prevention behaviors often fails to receive support when the prevention act advocated is a type of vaccination behavior. In fact, several studies found loss-framed messages to be more effective in promoting various types of vaccination, including MMR vaccination (e.g., Abhyankar, O'Connor, & Lawton, 2008), flu vaccination (Ferguson & Gallagher, 2007), and human papillomavirus (HPV) vaccination (e.g., Gerend & Shepherd, 2007; Gerend, Shepherd, & Monday, 2008). One study found no difference in persuasiveness between the two frames (McCaul, Johnson, & Rothman, 2002). No study to date has shown gain-framed messages to be more effective than loss-framed messages in promoting vaccination.

What is unique about vaccination compared to other prevention behaviors that renders loss-framed messages particularly effective? One possibility is that, unlike other prevention behaviors such as using sunscreen and exercising that seem to be

safe and harmless, vaccination frequently engenders safety concerns (Ball, Evans, & Bostrom, 1998). The general public may recognize the benefits of vaccination, but at the same time may be cautious about possible side effects. Choosing to get vaccinated thus could be considered a risky choice. Thus, loss-framed messages should be expected to be more effective than gain-framed messages when promoting vaccination. Consequently, rather than making predictions about the relative effectiveness of gain- versus loss-framed messages based on the function of the health behavior (i.e., prevention, detection, or recuperative), there appears to be particular utility to base our predictions on whether the outcome of performing the health behavior is risky or uncertain.

Issue Involvement

Other than the type of behavior promoted by a health message, message recipients' level of involvement with the health issue appears to be another factor that determines the relative persuasiveness of gain- versus loss-framed messages. Maheswaran and Meyers-Levy (1990) argue that loss frames will be more effective than gain frames when issue involvement is high, whereas the reverse will be true when issue involvement is low. Theoretical basis of these predictions is built upon dual-process theories of persuasion. Two prominent members of this theory family are the elaboration likelihood model (ELM; Petty & Cacioppo, 1986) and the heuristic systematic model (HSM; Chaiken, Liberman, & Eagly, 1989). Both theories share the core assumption that people process information in two qualitatively different ways. One processing mode is more superficial or effortless, referred to as peripheral processing in the ELM and heuristic processing in the HSM. The other processing mode is more deliberative and effortful, named as central processing in the ELM and systematic processing in the HSM. According to both models, high motivation and ability to process information will lead to central or systematic processing. Under this situation, people will elaborate on the substantive content of a persuasive message that addresses the true merits of the central topic. Because negative information is often more powerful than positive information, a loss frame is expected to be more persuasive than a gain frame when message recipients are highly involved with the health issue. Indeed, research on information processing has documented a consistent asymmetric effect of negative versus positive information on people's cognitive and affective reactions (see Taylor, 1991). Negative versus positive information is often perceived as being more diagnostic and weighted more in people's judgments (Anderson, 1965; Dreben, Fiske, & Hastie, 1979; Fiske & Taylor, 1991; Kanouse & Hanson, 1972). The notion that negative information receives more weight in judgment than positive information is also consistent with the idea of loss aversion specified in prospect theory (Kahneman & Tversky, 1979).

When motivation or ability to process information is low, peripheral or heuristic processing will occur. Instead of elaborating on the substantive content of a

persuasive message, people with low motivation or ability to process information will only attend to salient cues in the persuasive message, such as attractiveness of the endorser or the valence of the message. The positive valence of gain frames presumably leads to more favorable persuasive outcomes than the negative valence of loss frames (Maheswaran & Meyers-Levy, 1990).

Several studies supported the moderating role of issue involvement in the relative effects of gain- versus loss-framed messages (e.g., Maheswaran & Meyers-Levy, 1990; Meyers-Levy & Maheswaran, 2004). While Maheswaran and Meyers-Levy emphasize the importance of issue involvement, Rothman and Salovey (1997) suggest that depth of processing (i.e., the degree to which message recipients engage in careful message scrutiny) is the true moderating variable and any variable (including issue involvement) that influences depth of processing is expected to play a moderating role. These variables may be related to the message, the audience, or the recommended health behavior. For example, research has found that unexpected information stimulates message processing (Baker & Petty, 1994; Maheswaran & Chaiken, 1991; Smith & Petty, 1996). Schwarz, Bless, and Bohner (1991) demonstrate that negative moods motivate systematic processing, whereas positive moods induce heuristic processing. In addition, Block and Keller (1995) have shown that perceived efficacy associated with a recommended health behavior (i.e., the degree of confidence that following the recommended health behavior will lead to the desired outcome) is negatively associated with depth of processing. They further demonstrate that when perceived efficacy is low, loss-framed messages are more effective, whereas when perceived efficacy is high, both frames are equally persuasive.

Overall, issue involvement or, more specifically depth of processing, is an important variable to consider when predicting the relative effects of gain- versus loss-framed messages. When depth of processing is minimal, message framing may have no impact on persuasion because the message is not processed adequately to have any impact on message recipients. When depth of processing is low, gain frames may have persuasive advantage over loss frames as message valence is often taken as a peripheral cue when forming judgment under this processing mode. Finally, when depth of processing is high, loss frames may be more effective than gain frames due to negativity bias (Taylor, 1991). However, it is also necessary to take into account the type of health behavior promoted when depth of processing is high. Rothman and his colleagues (Rothman et al., 1993) found that gain frames have more favorable impact than loss frames on females' sun protection behaviors, even though for females skin protection is typically a high involvement issue.

Approach/Avoidance Motivation

Another message recipient-related factor that potentially influences the relative persuasiveness of gain- versus loss-framed messages is an individual's approach/avoidance motivation. In general, motivation theories posit two orthogonal motiva-

tion systems: behavioral inhibition system (BIS) and behavioral activation system (BAS) (Carver, Sutton, & Scheier, 2000; Elliot & Covington, 2001). The BIS system produces avoidance motivations, rendering individuals highly sensitive to punishment or threat cues. The BAS system leads to approach motivations, which heighten sensitivity to reward or incentive cues. Overall, people with BAS are responsive to the presence or absence of positive outcomes, whereas those with BIS are sensitive to the presence or absence of negative outcomes.

The contrast between BAS and BIS is also evident in regulatory focus theory (Higgins, 1997, 2002), which distinguishes between two basic types of self-regulatory orientations toward goal pursuit: promotion focus and prevention focus. "A promotion focus represents goal pursuit in terms of hopes and aspirations (ideals) and entails an orientation toward accomplishment and a sensitivity to the presence and absence of gain/nongain outcomes. A prevention focus represents goal pursuit in terms of duties and obligations (oughts) and entails an orientation toward security and a sensitivity to the presence and absence of nonloss/loss outcomes" (Cesario, Grant, & Higgins, 2004, p. 389). Although an individual can hold both a promotion and prevention focus, one orientation may be more salient or accessible than the other. Individuals who are predominantly promotion focused are more sensitive to the presence or absence of positive outcomes; those who are predominantly prevention focused are more sensitive to the presence or absence of negative outcomes.

A number of studies have demonstrated that message recipients' salient motivations (approach or avoidance) and orientations toward goal pursuit (promotion focus or prevention focus) have systematic impact on the relative persuasiveness of gain-versus loss-framed messages (Cesario et al., 2004; Lee & Aaker, 2004; Mann et al., 2004; Nan, 2008). Overall, the findings support the congruity hypothesis in that a health message is most persuasive when the frame and the motivation are congruent (i.e., a loss frame matched with an avoidance motivation or a prevention focus, a gain frame matched with an approach motivation or a promotion focus). Mann et al. (2004), for instance, measured participants' approach/avoidance motivation with the BIS/BAS scale. The participants were presented with a health message promoting dental flossing that was either gain-framed (e.g., "flossing your teeth daily removes particles of food in the mouth, avoiding bacteria, which promotes great breath") or loss-framed (e.g., "if you do not floss your teeth daily, particles of food remain in the mouth, collecting bacteria, which causes bad breath"). It was found that the loss-framed message worked better for people high in avoidance motivation, whereas the gain-framed message was more effective for those high in approach motivation.

Similarly, Lee and Aaker (2004) showed that people who differ in their regulatory focus respond differently to gain- versus loss-framed messages. The researchers demonstrate that loss-framed messages are generally more effective than gain-framed messages for individuals who are prevention focused. On the other hand, gain-framed messages are more persuasive than loss-framed messages for those who are promotion focused. Nan (2008) showed that matching the framing of a public service

announcement with message recipients' regulatory focus (a gain frame with a promotion focus, a loss frame with a prevention focus) can improve the persuasiveness of the message. Similar results were found by Cesario et al. (2004). In explaining the findings supporting the congruity hypothesis, scholars cited the notion of regulatory fit posited in regulatory focus theory (Higgins, 1997, 2002). Regulatory fit occurs when one's goal is matched with a strategy that is conducive of that goal. The theory argues that there is a natural fit between promotion-focused goals and pursuing these goals with eager means (e.g., achieve gains, avoid nongains), and between prevention-focused goals and pursuing these goals with vigilant means (e.g., avoid losses, ensure nonlosses). When the goal and means of goal pursuit fit with each other, people will experience a positive affect, which can be best characterized as a "feeling good" experiential state. Importantly, this positive affect may be transferred to message evaluations (Cesario et al., 2004). Lee and Aaker (2004) further argue that regulatory fit enhances message-processing fluency (i.e., the ease with which people process messages), which has a positive impact on message responses and evaluations. Gain-framed messages, by highlighting an eager means of goal pursuit, fit promotion-focused goals. Loss-framed messages, which emphasize a vigilant means of goal pursuit, fit prevention-focused goals. For these reasons, gain-framed messages are expected to be more persuasive than loss-framed messages for message recipients who are promotion focused, whereas loss-framed messages are expected to be more effective for those who are prevention focused.

The moderating role of motivation and the moderating role of the type of health behavior promoted in message framing effects might be regulated by the same psychological mechanism (Rothman et al., 2006). To the extent that thinking about detection behavior induces a prevention mindset, health messages promoting detection behaviors may generally foster a prevention focus. To the extent that thinking about prevention behaviors engenders a promotion mindset, health messages that encourage the adoption of prevention behaviors may serve to induce a promotion focus. As a result, gain-framed messages, due to their strategic fit with promotion-focused concerns, are more effective than loss-framed messages when the advocated actions are prevention behaviors. Loss-framed messages, due to their strategic fit with prevention-focused concerns, are more persuasive when the advocated acts are detection behaviors.

Desirability of End-States

One more important moderator of message framing effects that has been proposed in the literature is the way in which message framing can be operationalized. Specifically, research suggests that there exist at least two distinct operationalizations of message framing. The first involves desirable end-states. Under this condition, a gain-framed message focuses on the desirable end-state achieved through compliance (e.g., "if you floss regularly, you will increase the likelihood that your gum is kept

healthy in the long run"). A loss-framed message highlights the desirable end-state foregone through noncompliance (e.g., "if you do not floss regularly, you will decrease the likelihood that your gum is kept healthy in the long run"). The second operationalization involves undesirable end-states. Under this situation, a gain-framed message emphasizes the undesirable end-state avoided through compliance (e.g., "if you floss regularly, you will decrease the likelihood that your gum suffers from bacterial erosion in the long run") and a loss-framed message stresses the undesirable end-state suffered through noncompliance (e.g., "if you do not floss regularly, you will increase the likelihood that your gum suffers from bacterial erosion in the long run").

The distinction between the two operationalizations of message framing appears to be similar to the difference between the two self-regulatory foci posited in regulatory focus theory (Higgins, 1997, 2002). Operationalizations focusing on desirable end-states are aligned with a promotion focus, whereas operationalizations focusing on undesirable end-states are consistent with a prevention focus. However, it is important to note that the difference between a promotion focus and a prevention focus is primarily a variation in message recipients with regard to their relatively stable dispositions. In comparison, whether a desirable or an undesirable end-state constitutes the focus of a persuasive message reflects a variation in message feature.

A few studies have shown that operationalizing message framing either in terms of desirable end-states or undesirable end-states can have systematic impact on the relative persuasiveness of gain- versus loss-framed messages (Lee & Aaker, 2004; Nan, 2007a; Zhao & Pechmann, 2007). Lee and Aaker (2004), for example, demonstrate that a gain-framed advertisement promoting Welch's grape juice worked better than its loss-framed counterpart when both frames were operationalized in terms of desirable end-states (e.g., the gain frame: "Get Energized;" the loss frame: "Don't Miss Out on Getting Energized"). On the other hand, the loss-framed message was more effective when both frames were operationalized in terms of undesirable end-states (e.g., the gain frame: "Prevent Clogged Arteries;" the loss frame: "Don't Miss Out on Preventing Clogged Arteries"). In another study, Zhao and Pechmann (2007) further showed that the most effective message was the one that matched the frame with an appropriate type of end-state as well as message recipients' regulatory focus. Specifically, they found that prevention-focused individuals were most persuaded by loss-framed messages anchored by undesirable end-states, whereas promotion-focused individuals were most persuaded by gain-framed messages operationalized in terms of desirable end-states. Nan (2007a) found a similar pattern of results, but only among individuals who were highly motivated to process the messages. Even though a number of individual studies have identified desirability of end-states as a significant moderator of message framing effects, O'Keefe and Jensen's (2006) meta-analysis suggests that operationalizing message framing differently in terms of desirable or undesirable end-states does not appear to make much difference in the relative persuasiveness of gain- versus loss-framed messages.

Conclusions

Understanding the relative persuasiveness of gain- versus loss-framed messages is of both theoretical and practical importance. Current literature on message framing has shed significant insight on how and when message framing influences persuasion. The majority of the literature focuses on message framing effects in the context of health communication. Four moderating variables have garnered most research attention. These include type of health behavior, issue involvement, approach/avoidance motivation, and desirability of end-states. Each line of research proposes specific ways in which the key variable moderates the relative effectiveness of gain-versus loss-framed messages and offers explanation for the underlying psychological mechanism. First, drawing upon prospect theory (Kahneman & Tversky, 1979), scholars have argued that gain-framed messages should be generally more effective than loss-framed messages when the promoted health behavior is used to prevent the onset of a health problem, whereas loss-framed messages should be more persuasive when the advocated health behavior aims to detect the presence of an illness (Rothman et al., 2003; Rothman & Salovey, 1997). Second, dual-process models (Chaiken et al., 1989; Petty & Cacioppo, 1986) inform the moderating role of issue involvement. It has been suggested that people with high issue involvement are persuaded more by loss-framed messages, whereas those with low issue involvement are persuaded more by gain-framed messages (Maheswaran & Meyers-Levy, 1990). Finally, regulatory focus theory (Higgins, 1997, 2002) suggests that the fit between the type of goals (approach or avoidance) and the means through which to pursue them (eager or vigilant) produces a sense of feeling right, which can be transferred to the evaluation of messages or facilitate message processing. With this reasoning, a number of scholars have argued that gain-framed messages are more effective than loss-framed messages when the messages are anchored by desirable end-states (Lee & Aaker, 2004; Nan, 2007a) or when the message recipients have approach motivations (Mann et al., 2004). On the other hand, loss-framed messages should enjoy a persuasive advantage when the messages focus on undesirable end-states or the message recipients hold avoidance motivations.

In conclusion, multiple psychological processes regulate the relative persuasiveness of gain- versus loss-framed messages. To date, these psychological processes have been investigated in isolation. There is in general a lack of effort to integrate the different theoretical perspectives into a broad theoretical framework based on which the relative effects of message framing can be understood. To what extent do these processes differ qualitatively from each other? Is there a common mechanism underlying all four processes? Scholars have argued that a similar psychological mechanism may be at work with regard to the moderating role of the type of health behavior and the moderating role of desirability of end-states (Rothman et al., 2006). This common mechanism is regulatory fit. Health messages promoting detection behaviors may naturally induce prevention mindsets, whereas those advocating prevention

behaviors are likely to prime promotion mindsets. Thus, gain-framed prevention messages are more effective than loss-framed prevention messages. On the other hand, loss-framed detection messages are more persuasive than gain-framed detection messages. Further, the moderating role of desirability of end-states and the moderating role of approach/avoidance motivation are both predicted by the principle of regulatory fit. If regulatory fit explains three of the four moderating variables that have been documented, what role does issue involvement play in this big picture? Rothman and Salovey (1997) argue that for message framing to have any effect, the message must be processed with some depth. Thus, the principle of regulatory fit in message framing effects may only hold when people have sufficient motivation and ability to process the message. When motivation or ability to process the message is minimal, message framing should make no difference in persuasion. When motivation or ability to process the message is low, Maheswaran and Meyers-Levy (1990) argue that people actually have a tendency to respond more favorably to gain-framed messages as the positivity of message valence appears to serve as a peripheral cue in attitude formation.

Recent developments in message framing research suggest that peripheral processing may not be the only mechanism that leads to a persuasive advantage of gain-framed messages. Another psychological process involving psychological reactance may play a role in inducing more negative responses to loss-framed messages relative to gain-framed messages. The theory of psychological reactance (Brehm, 1966; Brehm & Brehm, 1981; Wicklund, 1974) suggests that people like to have the freedom to do certain things. When the freedom to engage in or not engage in a certain behavior is threatened or eliminated, individuals will experience reactance, a motivational state that leads them to restore their freedom. In the context of persuasive communication, freedom restoration often involves message derogation, source derogation, negative thoughts, anger, and boomerang effects (i.e., adopting the forbidden act). Recent studies have shown that loss-framed messages are often perceived as a greater threat to freedom and induce more psychological reactance than gain-framed messages (Nan, 2007b; Quick, Bates, & Wang, 2008; Reinhart, Marshall, Feeley, & Tutzauer, 2007; Zhao & Nan, 2010). For these reasons, loss-framed messages have been found to be less effective than their gain-framed counterparts (Nan, 2007b; Quick et al., 2008; Reinhart et al., 2007).

Overall, extant research on message framing has generated significant insight into the important inquiry of the relative persuasiveness of loss- versus gain-framed messages. The implications of the theory of psychological reactance for the study of message framing have only begun to be explored. More research is needed to further our understanding of how psychological reactance may play a role in message framing effects. More importantly, more research is needed to integrate the different theoretical perspectives that have been cited to explain message framing effects. An integrated view based on regulatory focus theory, dual-process theories, and the theory of psychological reactance appears to be promising. However, whether and how prospect theory offers explanatory power over and above these theories still

needs to be determined. Recent studies showing a greater persuasive advantage for loss- versus gain-framed messages demonstrate strong applicability of prospect theory in message framing (Abhyankar et al., 2008; Ferguson & Gallagher, 2007; Gerend & Shepherd, 2007; Gerend et al., 2008). The extent to which prospect theory can be integrated into the broad framework needs to be considered. In line with the effort of developing a more integrated framework, empirical studies that examine the role of multiple moderating variables in a single design will provide appropriate tests for such a framework. Finally, how message framing can be strategically used in promoting recuperative behaviors calls for more systematic inquiry. Investigating message framing effects in promoting a complete spectrum of health behaviors and appreciating the differences within each broad type of health behaviors (e.g., vaccination versus exercise as prevention behaviors) will offer important theoretical insights into how message framing works in health communication.

While research on message framing effects offers a number of guidelines for how to construct effective health messages, to be able to truly follow these guidelines in practice would require significant formative research designed to pretest and evaluate alternative messages before the launch of a full-scale communication campaign. Formative research will provide insights into which framing executions are effective for particular combinations of topics and message recipient-related characteristics. Health communication has been increasingly recognized as an important component to comprehensive national/local programs that seek to protect and promote public health. Whether in the area of healthcare delivery or in the realm of health promotion, effective communication is often key to success. Applying what we know about persuasive communication in general, and message framing effects in particular, to the development of health communication messages is a critical step toward improving communication effectiveness and, ultimately, individual health and well-being.

The Intended and Unintended Effects of Advertising on Children

Moniek Buijzen and Patti M. Valkenburg

ABSTRACT

The effects of advertising on children have often been divided into two general types: intended effects (e.g., children's brand awareness, preferences, and purchase requests) and unintended effects (e.g., materialistic orientations, parent-child conflicts, and unhealthy eating habits). The first part of this chapter discusses theories of advertising processing. The second part reviews the literature on intended and unintended advertising effects. The third part addresses the factors that may moderate advertising effects, focusing on the role of children's development and parental communication. Finally, we discuss the social significance of the conclusions that emerge from the literature.

Children's Processing of Advertising

The past three decades have witnessed a dramatic commercialization of children's media environment. The financial attractiveness of the youth market, in combination with the growing number of media tools at the marketers' disposal, has led to significant increases in child-directed advertising. This chapter discusses the effects of advertising on children. These effects have often been divided into two general types: intended effects (e.g., children's brand awareness, preferences, and purchase requests) and unintended

effects (e.g., materialistic orientations, parent–child conflicts, and unhealthy eating habits). The first part of this chapter will discuss theories of advertising processing. The second part reviews the literature on intended and unintended advertising effects. The third part addresses the factors that may moderate advertising effects, focusing on the role of children’s development and parental communication. Finally, we discuss the social significance of the conclusions that emerge from the literature.

Since the turn of the new millennium, advertisers targeting the youth market have rapidly adopted new media technologies including branded websites, online message systems, and “brand placement” in popular computer games. However, as yet most studies have focused on traditional television advertising (i.e., discrete advertisements of standard lengths that appear at predictable intervals in program breaks). Moreover, television viewing is still children’s predominant leisure time activity (Rideout, Foehr, & Roberts, 2010), and most child-directed advertising expenditures focus on television advertising. A recent global study investigating television advertising in 11 countries showed that at peak viewing times, children were confronted with an average of 27 commercials per hour (Kelly et al., 2010). Therefore, this chapter focuses predominantly on the effects of television advertising. In addition, in the theoretical sections, we also include considerations regarding non-traditional advertising practices

The existing child and advertising literature has predominantly focused on the outcomes of advertising exposure, while only sporadic attention has been devoted to the underlying mechanisms of the persuasion process (Austin, 2001; Austin & Johnson, 1997; Buijzen, 2007; Livingstone & Helsper, 2006). To understand how children process advertising, this chapter draws upon the rich theoretical and empirical work on adult persuasion processes. The adult advertising literature encompasses numerous models of persuasion, although most authors agree that persuasion can occur through several processes. The two most widely adopted multiple-process models are the elaboration likelihood model (Petty & Cacioppo, 1996) and the heuristic systematic model (Eagly & Chaiken, 1993; see Chapter 26, this volume). Although those models differ in several respects, they share the fundamental assumption that under some conditions, people process a persuasive message systematically and carefully (referred to as the systematic or central process) and at other times, they rely on simple cues or shortcuts, using low-effort mechanisms to respond to a message (the heuristic or peripheral process). Over the past decade there has been increasing attention toward a third even less elaborate process, characterized by a primacy of automatic, affective, and unconscious reactions: the automatic or experiential process (Meyers-Levy & Malaviya, 1999).

The three persuasion processes are characterized by varying levels of *cognitive elaboration* in response to a message – that is, the recipients’ level of processing of the available information in the immediate persuasion context. Cognitive elaboration, in turn, relates to the recipients’ level of attention to and awareness of the message and to their motivation and ability to process the message effortfully. In addition, each of the three persuasion processes comprises different mechanisms that lead to an effect. Thus, although each process may have an intended or unintended

effect, the specific mediating mechanisms via which this may occur differ in accordance with the processing route taken. Importantly, children's relatively immature advertising and consumer skills (e.g., advertising literacy, marketplace experience, brand memory, and consumption autonomy) are likely to affect their advertising processing. Before elaborating on the role of development, we first discuss the various processes and their intended and unintended outcomes.

Systematic persuasion processing is based on relatively extensive, deliberate, and effortful cognitive elaboration. For systematic processing to occur, the child must show high attention to and awareness of the message, and be highly motivated and able to process all available information. When children are concerned, it is relevant to distinguish between two levels of systematic processing. At the most elaborate level, critical systematic processing, an awareness of the persuasive nature of the message is involved, with the recipient actively applying the relevant persuasion knowledge or advertising literacy. At a less elaborate level, noncritical systematic processing involves a high awareness of the message or brand, without awareness of its persuasive intent. In the systematic process, persuasion mechanisms leading to attitude change involve active learning mechanisms and formulation of cognitive responses, such as pro- and counterargumentation to message claims and deliberation over the message source. The strength of the effect may depend on, for example, the strength of the persuasive arguments or the credibility of the message source (Petty, Cacioppo, Strathmann, & Priester, 2005).

Heuristic persuasion processing is characterized by a moderate level of cognitive elaboration. Compared to the systematic process, the recipient uses merely moderate to low levels of message attention and awareness, and a low motivation and ability to process the message. Within the heuristic process, the recipient looks for an easy way to form an overall evaluation of the product or brand and thus relies on relatively simple and low-effort decision strategies. Therefore, consumer defenses are less likely to affect this type of processing, when compared to systematic processing (Livingstone & Helsper, 2006). The mechanisms leading to persuasion involve relatively passive learning and information retrieval mechanisms, such as social learning and consumer cultivation (Shrum, Burroughs, & Rindfleisch, 2005). The outcome of the heuristic process may depend on simple heuristic cues, such as number of persuasive arguments, source attractiveness, and product symbolism. Current marketing practices, particularly those aimed at children, rely heavily on this type of processing, given the increased focus on emotion- and entertainment-based strategies in persuasive messages rather than information and rational argumentation.

Finally, in *automatic persuasion processing*, advertising exposure leads to attitude change without explicit attention to or awareness of the persuasive communication (Meyers-Levy & Malaviya, 1999): Recipient motivation and ability to process are not required. Consumer defenses are unlikely to be activated, because recipients are often unaware that they are being targeted. Highly embedded and stealth forms of marketing rely on this type of processing. Explicit recall of the persuasive message and the advertised product or brand will be low, yet implicit brand memory and attitude

changes can be detected, for example through implicit recognition and association tests (Owen, Lewis, Auty, & Buijzen, 2010; Yang & Roskos-Ewoldson, 2007).

In the automatic persuasion process, persuasion occurs through implicit and affect-based learning mechanisms, such as evaluative conditioning (i.e., pairing a brand with affectively laden stimuli such as celebrity endorsers or pleasant pictures) and affect transfer (i.e., the positive affect associated with the media experience transfers to the brand). In this process, brand exposure leads to more fluent processing when the brand is encountered again. This facilitated processing fluency leads to a sense of familiarity that may, in turn, be misconstrued as a beneficial quality, resulting in positive affect toward the brand. The strength and direction of the effect within the automatic process can be determined by, for example, exposure duration and the valence of the message. For example, the positive affect associated with an entertaining advergame (i.e., a custom-built online game designed to promote a brand) becomes transferred to the brand (i.e., brand attitude change) outside conscious awareness.

Advertising Processing and Advertising Effects

Systematic, heuristic, and automatic persuasion processing may each lead to intended and unintended effects. However, the strength and endurance of the effect may differ according to the processing route taken. For example, recent literature on attitude formation suggests that different levels of processing may result in different types of attitudes, which in turn affect different types of consumer decisions. Specifically, lower levels of processing are more likely to result in implicit attitude formation, which plays a more important role in spontaneous and impulsive consumer behavior. Systematically formed attitudes are likely to be more explicit and predict more conscious and deliberate consumer decisions (Petty, Fazio, & Briñol, 2009). Unfortunately, the variables revealing the persuasion process and its particular outcome, such as implicit versus explicit measures, have largely been ignored in the research literature on children and advertising. Yet the few studies that have recently begun to explore this domain suggest that the mechanisms of adult persuasion also apply to children, for example revealing processing fluency mechanisms among young children (Auty & Lewis, 2004; Owen et al., 2010).

Intended Advertising Effects

Intended effects include the effects of advertising as anticipated by advertisers, marketers, and manufacturers of children's products. They may wish, for example, to influence children's brand awareness, brand preferences, and purchase requests. Intended effects have received ample research attention, mostly from marketing

researchers driven by the question as to how to target the child market in the most effective way. Unfortunately, most of the commercial studies are usually not available to the academic world. A literature search in the major social science databases shows that approximately 50 academic studies have been published on the intended effects of advertising on children. These studies can be roughly divided into three categories: studies on (1) cognitive effects (i.e., brand awareness), (2) affective effects (i.e., brand attitudes and preferences), and (3) behavioral effects (i.e., purchase requests to parents and consumption).

Cognitive Effects

Brand awareness is one's active and passive knowledge of a particular brand. Research on the brand awareness of young children has focused on two aspects of brand awareness: brand recognition and brand recall. Both brand recognition and recall have usually been operationalized by showing children a series of brand logos, brand characters, or commercials. In the case of brand recall, children were asked to name the specific brand when cued by the stimulus. In the case of brand recognition, they were invited to choose from a number of available visual options.

Both brand recognition and recall are important when making purchase decisions. For a decision for a particular brand in the retail environment, only recognition is necessary because the various alternatives are alongside one another on the shelf. For a decision to be made in another context, recall is necessary, because the various alternatives are not available at that time. In order to be able to function as a consumer, a child must therefore be capable of both brand recognition and recall. The relation between advertising and children's brand awareness has been studied in two ways. There is correlational research, in which the relationship between the frequency that children watch television and their brand awareness is determined. In addition, there is experimental research, in which children are shown one or more commercials for a particular brand, after which their brand awareness is determined.

The correlational studies investigating brand recognition all found that children who watched a great deal of television could recognize more brand logos and/or brand characters (Derscheid, Kwon, & Fang, 1996; Fischer, Schwartz, Richards, Goldstein, & Rojas, 1991; Valkenburg & Buijzen, 2005). However, the correlational research on the brand recall of children has come up with less clear results. In a study by Ward, Wackman, and Wartella (1977), children of 4 to 12 years of age were asked to name as many brands as possible from a particular product group. Although most products that were named were those that were advertised a lot on television, the relation between watching television and brand recall was not significant. However, with older teenagers, from 15 to 18 years of age, a positive relation was found (Ward & Wackman, 1971).

The experimental studies yielded similar patterns of results. As in the case of the correlational studies, in all experiments exposure to commercials had a considerable effect on the brand recognition of the children. In a study by Macklin (1983), for example, 4- and 5-year-old children were shown three commercials, one of which

was for a cereal brand. After seeing just one commercial, 61% of the 4-year-olds and 65% of the 5-year-olds could recognize the cereal brand. However, the experimental studies also revealed that the brand recall of young children was affected less by advertising than their brand recognition. However, this does not seem to hold for adolescents. A study by Dubow (1995), among 13- to 17-year-olds demonstrated that television advertising has a large effect on both the brand recognition and brand recall of adolescents, even greater than its effect on adults.

In conclusion, both the correlational research and experimental research on brand awareness shows that the influence of advertising on the brand recall of young children is smaller than its influence on their brand recognition. However, among adolescents, advertising exposure affects both brand recognition and recall. An explanation for this finding is that recall memory requires greater cognitive efforts than recognition memory (Siegler, 1998). Recalling something requires a mental journey to a particular information unit in memory and then, in a second step, an evaluation of whether the activated information unit is the correct one. In the case of recognition memory, only the second step is necessary. Most recall tasks, particularly those in which children have to come up with the brand name themselves, are probably too difficult for young children, whose memory abilities have not yet fully developed. Perhaps so difficult that advertising has little or no effect on their brand recall. An explanation for the finding that advertising does affect the brand recall of adolescents, is that older children possess better strategies to aid their memory, and have more brand-related knowledge and experience.

Affective Effects

This type of research focuses on the question of whether advertising can influence brand attitudes and preferences. Attitudes in general and brand attitudes in particular, are difficult to influence, in any case more difficult than brand awareness (Petty et al., 2009). Even the youngest of children have distinct ideas on what they like and dislike (Valkenburg, 2004). Their attitudes towards brands are determined by many factors, including their gender, cognitive level, temperament, media preferences, and their susceptibility to peer influence (Moschis, 1987). All these factors determine their selective exposure and attention to media content and advertising, and, as a result, the effects of these media contents. If children are not interested in the content of a commercial, it is unlikely that their brand attitudes and preferences will be influenced by it.

The research literature on affective effects of advertising can also be divided into correlational and experimental studies. Atkin (1975) was one of the first to find in a correlational study that exposure to advertising was not enough on its own to influence the brand preferences of children. He asked 755 children how often they had seen a certain commercial for a *Snoopy* pencil sharpener. He also asked them whether they liked the commercial and pencil sharpener. Initially he found a significant relationship between the number of times that children had seen the commercial and their attitude towards the pencil sharpener. That significant relationship, however,

disappeared once Atkin controlled for children's attitude towards the commercial. This means that children's liking of the commercial moderated the relation between exposure frequency and attitude toward the product. Other correlational research confirmed that the brand preferences of children are heavily influenced by their preference for the specific commercial (Derbaix & Bree, 1997; Moore & Lutz, 2000).

A number of correlational studies did find positive relations between children's exposure to advertising and their attitudes toward commercials and brands. For example, a recent study on Australian children's food attitudes and preferences showed that commercial TV viewing was associated with more positive attitudes toward junk food (Dixon, Scully, Wakefield, White, & Crawford, 2007). A possible explanation why some studies do find a direct relation between advertising exposure and attitudes is the strategy to include product symbolism in advertising. By depicting desirable symbolic values and appeals in commercials, such as fun, social status, attractiveness, and energy, advertising creates the impression that the advertised products are associated with those values (Buijzen & Valkenburg, 2000). The finding that children who watch more advertising hold more positive attitudes toward advertised products, could be explained by a longer-term consumer cultivation effect, in which higher exposure frequency leads to ideas and attitudes that are more similar to the values represented in advertising (Shrum et al., 2005).

The effect of advertising on children's brand attitude has also been investigated in various experimental studies. Some studies focused on sweets, ice cream, or cereals, others on toys and yet others on personal care products, such as anti-acne products or lipstick. Most studies showed children one or more commercials and then asked them how much they liked the advertised product. In a study by Gorn and Goldberg (1977) boys of 8 to 10 years of age were shown a cartoon. The study consisted of four experimental groups. In the first group, one commercial for a new brand of toy was shown during the cartoon. In two other groups, either two or three commercials were shown during the cartoon. A control group was not shown any commercials. The brand attitude of the boys who had seen the commercial was significantly more positive than that of those who had not seen the commercial. It made no difference whether the boys had seen the commercial once, twice, or three times. In the short-term, repetition therefore did not have any effect on the brand attitude of children.

Gorn and Florsheim (1985) showed seventy 9- and 10-year-old girls a video of 20 minutes with an interview with Steven Spielberg. During the video, half of the girls were shown two commercials of a lipstick brand and two commercials of a brand of diet drink. A preliminary investigation had revealed that the girls were interested in lipstick but not in diet drinks. The study found that the lipstick commercial had a positive effect on the girls' attitude towards lipstick, whilst the diet drink commercials had no effect on their attitude towards diet drinks. This study also confirms that a commercial has an effect on the brand attitude only if children have some degree of interest in the product or brand.

In conclusion, the various studies show that advertising can indeed affect children's brand attitudes though it does not necessarily have to happen. When a small effect

is found at the aggregate level (for all children together), there may be a larger, smaller, or even no effect at all within certain subgroups. The research also shows that the brand attitude and preferences of children are determined by many factors, including the gender and age of the child, the familiarity with the brand, the interest in the advertised brand or product, and the child's liking of the commercial.

Behavioral Effects

Most studies into behavioral effects have focused on children's purchase requests. Because children usually do not typically have the financial means to purchase products themselves, advertisers are most interested in the influence they exert on their parents' purchases. The correlational studies that have investigated the relation between advertising exposure and purchase request behavior have all demonstrated that children who often watch commercial television ask their parents for products more often (e.g., Buijzen & Valkenburg, 2003b; Pine & Nash, 2002; Robertson, Ward, Gatignon, & Klees, 1989). In a study investigating children's Christmas wishes, we found that children who watched commercial television more often had more advertised products on their wish list. The brands most heavily advertised in the holiday season appeared on their wish lists most often (Buijzen & Valkenburg, 2000).

Several experimental studies have focused on behavioral advertising effects. Brody, Stoneman, Lane, and Sanders (1981) investigated the impact of advertising exposure on children's purchase requests. In the experimental group, 3- to 5-year-olds and their mothers were shown a cartoon with commercials for food products, while a control group watched the cartoon without the commercials. After viewing the cartoon, the mother and child went supermarket shopping. Children who had watched the cartoon with the commercials made significantly more purchase requests than children who had not seen the commercials. In a quasi-experiment among 475 Canadian 9- to 12-year-olds, Goldberg (1990) compared the household purchase of cereals among English- and French-speaking children. The English-speaking children, who were more likely to watch the US networks broadcasting most cereal advertising, mentioned significantly more advertised brands than the French-speaking children, who watched the low-advertising French-language networks.

In a more recent experiment, Auty and Lewis (2004) showed 6- to 7- and 11- to 12-year-olds a scene from the movie *Home Alone*. In both age groups, half of the children watched the scene with a brand placement for Pepsi Cola, while the other half watched the same scene without the brand placement. After watching the fragment, the children were offered to take a drink. They could choose from a tray with cans of Pepsi and Coca Cola. In the group of children who had seen the Pepsi brand placement, 62% took a can of Pepsi, while in the control group only 42% chose Pepsi. This significant effect held for both the younger and the older children.

In conclusion, most correlational and experimental studies investigating the behavioral effects of advertising observed significant relations between advertising exposure and children's requests for advertised products and brands. In addition, several studies have investigated the impact of advertising on children's food consumption

patterns. Because these studies have mostly been driven by concerns about the increasing prevalence of overweight and obese children, we discuss their findings in the following section.

Unintended Advertising Effects

Research into the unintended effects of advertising focuses on the secondary, often undesired, side effects of advertising exposure. The literature has included looking at the question of whether advertising (1) increases materialistic orientations, (2) stimulates family conflicts, (3) decreases life satisfaction, and (4) causes overweight and obesity.

Materialistic Orientations

First, a number of researchers have suggested that advertising makes children materialistic. According to these authors, advertising enhances materialism because it is designed to arouse desires for products that would not otherwise be salient. Advertising propagates the ideology that possessions are important and that desirable qualities – such as beauty, success, and happiness – can be obtained only by acquiring material possessions (Pollay, 1986).

Several studies have examined whether this is indeed the case. In the correlational studies that have been carried out, materialism has been investigated by asking children to respond to various statements, such as “It is true than money can make you happy” and: “It is my dream to be able to have expensive things.” With one exception (Ward & Wackman, 1971), all correlational studies found positive relationships between the viewing frequency of commercial television and the materialistic attitude of children and adolescents. In a recent longitudinal study in which 452 Dutch children between 8 and 12 years of age were surveyed twice with a one-year interval, we found that the causal direction pointed from advertising to materialism and not the other way around (Opree, Buijzen, Valkenburg, & Van Reijmersdal, 2010). The experimental studies, too, have shown that advertising has an effect on the materialistic attitudes of children (Goldberg & Gorn, 1978; Greenberg & Brand, 1993).

Parent–Child Conflict

Second, a number of authors have suggested that advertising contributes to conflicts between parents and children. The underlying idea here is that advertising encourages children to ask for the advertised product. Because parents naturally do not want to comply with all these product requests, they have to say “no” to their children more often. As a result, the chance of conflicts between the parent and child increases.

The question of whether advertising exposure increases the number of product requests has already been discussed. This is an intended advertising effect, and research shows that this effect exists. But do these increased product requests lead to more parent–child conflicts? The relationship between purchase requests and family

conflict has been investigated in five correlational studies. These studies all found a significant and high positive correlation between the number of purchase requests and parent–child conflicts (Buijzen & Valkenburg, 2003a).

An experiment conducted by Goldberg and Gorn (1978) also suggests that advertising can stimulate parent–child conflict. In this study, half of a group of 4- and 5-year-olds was shown a children's program in which a commercial for an appealing toy was inserted. The other half of the children was not shown this commercial. At the end, all children were asked whether they preferred to have a tennis ball or the advertised toy. It was added that their mothers preferred them to have the tennis ball. Children who had seen the commercial went against the wishes of their mothers more often (45.8%) than those children who had not seen the commercial (21.3%).

Decreased Life Satisfaction

Third, some researchers believe that advertising makes children less satisfied with their lives. Various hypotheses have been put forward for this claim. The first derives from the social comparison theory (Festinger, 1954). It is assumed that advertising paints a world for children full of beautiful people and desirable products. If children watch too many commercials and compare them to their own situation, the contrast between the two worlds can make them unhappy. The few studies that investigated this hypothesis have focused on the effect of beautiful models in magazines on the self-perception of teenage girls and female students. These studies have produced mixed results. An experiment by Richins (1991) found that female students after seeing a printed advertisement with a beautiful female model felt less good about themselves. In a study by Martin and Kennedy (1993), conducted among girls of 9 to 18 years of age, no influence was found of advertising on the way the girls perceived their own looks. See Chapter 15 for a more detailed discussion of media and body image.

Another hypothesis about the relation between advertising exposure and decreased life satisfaction involves materialism as a mediating factor. It is generally assumed that advertising-induced materialism results in decreased life satisfaction, because materialistic people are assumed to be less satisfied with their lives. Materialistic people consider objects as an important means to gain happiness. When the products fail to yield the promised state of happiness, unhappiness will follow. As described above, there is evidence for a relation between advertising exposure and materialism. However, although the relation between materialism and life dissatisfaction has been established among adults (Wright & Larsen, 1993), it has as yet not been found among children. In conclusion, the research into the relation between advertising and life satisfaction is too scarce and scattered to draw decisive conclusions.

Overweight and Obesity

Finally, advertising is often named as one of the possible causes for the increasing prevalence of overweight and obese children. Critics hold advertising responsible for the problem of childhood obesity because of its abundant promotion of unhealthy

food, that is products containing relatively high proportions of fat, sugar, and salt (Matthews, Cowburn, Rayner, Longfield, & Powell, 2004). Many studies have shown that exposure to food advertising leads to less healthy dietary patterns among children. In a household-diary study among 234 parents of children aged 4 to 12, in which we compared children's media use with their consumption behavior during four days, we found that children's exposure to food advertising was associated not only with their consumption of advertised brands (e.g., Lay's chips) but also with their consumption of the unhealthy advertised product categories (e.g., savory snacks in general) (Buijzen, Schuurman, & Bomhof, 2008b).

Most researchers also agree that exposure to advertising does increase the chance of being overweight (McGinnis, Gootman, & Kraak, 2006). However, the observed relations are often relatively small, especially when compared to other influences such as parental dietary patterns. In addition, it is often difficult to disentangle the specific role of advertising from other factors associated with television viewing. In the diary-survey study described above (Buijzen, Schuurman, & Bomhof, 2008a), we distinguished between advertising exposure and general television viewing behavior and investigated three alternative explanations for the relation between children's television viewing behavior and their weight status: (a) the advertising effects hypothesis (i.e., advertising exposure stimulates intake of energy-dense food products), (b) the eating while viewing hypothesis (i.e., television viewing is linked to total food intake), and (c) the activity displacement hypothesis (i.e., television viewing replaces more energy-demanding leisure activities). Our analyses showed that children's food advertising exposure and television viewing time were both associated with an unbalanced diet. In addition, television-viewing time was related negatively to outdoor playing time. However, recent longitudinal research suggests that in the long-term, advertising exposure is the most important predictor for being overweight and for obesity, lending the most convincing support for the advertising effects hypothesis (Goris, Petersen, Stamatakis, & Veerman, 2009; Zimmerman & Bell, 2010).

In conclusion, the literature shows that exposure to advertising has intended and unintended effects on children. However, these effects are not uniform and vary in strength for different types of children. Several moderating influences have been investigated, including individual and social factors. In the following sections we will focus on the factors that have received most attention in the academic debate: the role of development and the role of parents and caretakers.

The Role of Development

It is generally assumed that younger children are more susceptible to the effects of advertising than older children and adults, because young children lack the skills, knowledge, and experience to critically evaluate advertising. It is also assumed that when children have obtained the necessary cognitive and information-processing

skills, they become less susceptible to advertising effects (cf. Kunkel et al., 2004). Indeed, there is rather convincing evidence that such “advertising literacy” develops with age (Rozendaal, Buijzen, & Valkenburg, 2010). Remarkably, reviews of the advertising effects literature that have systematically investigated the role of development have not found conclusive evidence that age affects the strength of advertising effects (Buijzen & Valkenburg, 2003a; Livingstone & Helsper, 2006). Moreover, recent studies on the role of advertising literacy have found that even when children possess the knowledge and skills to critically process an advertising message, they can still be persuaded by it (Livingstone & Helsper, 2006; Mallinckrodt & Mizerski, 2007; Rozendaal, Buijzen, & Valkenburg, 2009).

These findings call into question the alleged moderating role of (literacy) development. A plausible explanation is provided by current insights that advertising effectiveness is not only determined by the cognitive and systematic responses to a message, but also, and perhaps more importantly, by less elaborate processing mechanisms – that is heuristic or automatic processes. As described at the beginning of this chapter, children can process advertising in several different ways. Applying advertising literacy (e.g., recognizing the source and the intent of a commercial) as a defense against persuasion requires high-level critical systematic processing. However, as we will argue in the following section, children are more likely to process advertising in less elaborate ways.

It is conceivable that development does not determine the *extent* to which children are influenced by advertising, but affects *how* they are influenced. Children’s relatively immature advertising and consumer skills (e.g., advertising literacy, marketplace experience, brand memory, and consumption autonomy) are likely to affect their processing of advertising messages. For example, when children are not yet able to recognize the commercial nature and persuasive intent of an advertising message, they will be less likely to process this message on the most elaborate level – that is, critical systematic processing. In addition, rational and critical systematic processing requires domain-specific knowledge which children often still lack.

The most important changes in advertising and consumer skills take place between infancy and early adolescence. Based on theories of consumer development and more general frameworks of children’s cognitive, social, and personality development, four phases in the development of children’s advertising processing can be distinguished: preschool (younger than 5-years-old), early elementary school (6 to 9 years), later elementary school (10 to 12 years), and adolescence (13 years and older). Within each phase, children accumulate consumer- and advertising-related skills and experience (John, 1999; Valkenburg & Cantor, 2001).

Up until the age of 5, children view advertising primarily as entertainment and are generally unaware of its persuasive intent. They have a limited ability to take a perspective other than their own, which inhibits their understanding of advertisers’ intentions (Moses & Baldwin, 2005). In addition, preschoolers lack the necessary information-processing abilities (i.e., explicit memory storage and retrieval) and market-related experience to process a persuasive message elaborately (John, 1999).

This renders systematic processing – and even heuristic processing – less likely. Preschoolers are therefore more likely to be influenced via the automatic process. Positive feelings evoked during exposure to attractive animated characters, bright colors, and lively music transfer to the advertised products and can help shape young children's brand attitudes without their knowledge (Moore & Rideout, 2007).

As children enter early elementary school, important changes take place in consumer development. Children become increasingly capable of perspective taking and contingent thought, and develop a basic understanding of advertising's selling intent. In addition, they become able to evaluate products and brands in more than one dimension. These increased abilities may result in more elaborate processing of persuasive communication. However, more elaborate processing does not necessarily involve critical processing in terms of counterargumentation and source derogation. Further, as their information-processing skills are not yet fully developed, early elementary school children are unlikely to spontaneously apply their persuasion knowledge as a defense during exposure to persuasive messages (Buijzen, 2007). Finally, children in this phase have been shown to be easily swayed by simple heuristic cues, such as favorite television characters, premiums, and physical aspects of product packaging (Calvert, 2008).

During later elementary school, children's cognitive and social abilities continue to evolve. Children become capable of abstract thought and reasoning and are able to see things within a broader perspective. They acquire the abilities and experience to process persuasive communication on a more elaborate level. They are able to evaluate advertising systematically and critically and to come to consumer decisions by carefully evaluating different aspects of advertised products and brands. In addition, on account of a growing financial independence and autonomy in making those consumer decisions, they are also more motivated to process messages elaborately. However, whilst they possess the abilities and motivations required for systematic processing, children in this age group still require prompts or cues to activate critical elaboration (John, 1999). Further, as peer influence becomes more important, late elementary school children become increasingly sensitive to heuristic cues, such as peer popularity and status appeal.

Finally, in adolescence, children's cognitive processing capacities reach adult-like levels and they become capable of processing advertising at the most elaborate level (Pechmann, Levine, Loughlin, & Leslie, 2005). Additionally, due to the development of hypothetical-deductive reasoning skills they become more critical and skeptical towards the surrounding world, including the commercial environment. However, despite these more mature cognitive skills, they are still in the midst of identity development, which may have important implications for the processing of commercial messages. In the early stages of identity development, self-presentation and conformity to the peer group or subculture are extremely important. In combination with a high degree of self-consciousness and social anxiety, this may result in a greater susceptibility to consumer symbolism, such as brand-related social status, image, and physical attractiveness.

In summary, it can be argued that young children are particularly sensitive to less elaborate processing mechanisms. Developmental changes characterizing childhood are likely to inhibit the motivation and ability to process persuasive messages systematically. It is therefore important to take children's developmental level into consideration when predicting how persuasive messages affect their processing of advertising. It is, however, uncertain whether and how this affects their susceptibility to advertising effects. Until recently, the advertising effects literature suggests that children's developmental level does not necessarily moderate the intended and unintended effects of advertising on children.

The Role of Parents and Caretakers

Parental communication is often considered the most effective tool in the management of advertising influence on children. The family context not only influences how children use the media and the messages they get from them, but also how literate they become as media users. Parents and caretakers have a wide range of communication strategies at their disposal to increase children's defenses against advertising effects, which can be grouped according to (1) the *object* of the communication and (2) the *style* of communication (Buijzen, 2009). First, parental communication strategies may apply either to the advertising messages or to the consumer-related attitudes and behaviors of the child (e.g., materialistic orientations, purchase requests, consumption behavior). Put in terms of advertising effects, advertising-related communication concerns the independent variable, while consumption-related communication relates to the dependent variable or outcome of advertising exposure.

Second, for both types of strategies two communication styles can be distinguished. A conformity-oriented communication style is aimed at obedience and conformity, and stresses control, rules, and restrictions, whereas a conversation-oriented communication style emphasizes open and critical family discussion (Ritchie & Fitzpatrick, 1990). Taken together, the various communication objects and styles result in four types of parental communication strategies: (1) conformity-oriented advertising communication, (2) conversation-oriented advertising communication, (3) conformity-oriented consumer communication, and (4) conversation-oriented consumer communication.

A conformity-oriented advertising communication strategy involves sheltering children from advertising by reducing their exposure to it, for instance by restricting children's viewing of commercial television networks. This type of strategy has also been labeled as restrictive mediation in previous research (Buijzen & Valkenburg, 2005). A conversation-oriented advertising strategy, or active mediation, includes making deliberate comments and judgments about advertising and actively explaining its nature and selling intent. Some parents use both types of strategies, trying to shelter their children from advertising, yet at the same

time explaining the intent of advertising and clarifying their motivations for the restrictions.

Further, a conformity-oriented consumer communication strategy may involve rule-making and restrictions regarding children's consumer attitudes and behavior, including their purchase requests and consumption behavior. A conversation-oriented consumer communication strategy emphasizes children's individual ideas and opinions and is aimed at increasing children's consumption autonomy. Parents using this strategy engage in active consumer education, focusing on the development of the child into a critical consumer. They may teach their children, for instance, to compare and evaluate products. These families center on open discussion between parents and children and value children's input and opinions when making family consumer decisions. Finally, similar to advertising-related strategies, parents can also use a combined consumer communication style, applying certain rules and restrictions regarding consumer matters, yet also explaining the motivations behind these rules.

In the past years, we have conducted several studies investigating and comparing the role of the various parental communication strategies. Our findings show that conversation-oriented communication strategies are generally more successful in reducing advertising effects than conformity-oriented strategies (Buijzen, 2009; Buijzen & Valkenburg, 2005). Most Western societies have become increasingly commercialized, and exposure to commercial messages is almost impossible to avoid. It is therefore important that children learn how to cope with those commercial temptations. However, conversation-oriented strategies are not always most successful in reducing advertising effects. Specifically, the effectiveness of the strategies may depend on the age of the child and on the type of effect that needs to be reduced.

When countering the intended yet undesired effects of advertising, such as excessive purchase request behavior, conversation-oriented advertising communication can be a successful strategy. In an experiment among 272 5- to 9-year-olds, we investigated the effectiveness of comments administered during children's exposure to commercials (Buijzen & Mens, 2007). Children were assigned to one of four conditions and received different types of comments while they were watching a compilation of six commercials for toys. The first group of children received factual comments about the commercials, including facts about the persuasive and selling intent of the commercials. The second group of children received evaluative comments, involving negative evaluations of the commercials and the products advertised. The third group received a combination of factual and evaluative comments, while the fourth group just watched the commercials, without any comments.

After viewing the commercials, the children completed a questionnaire measuring several intended effects of the commercials. Our findings showed that the combined comments were most effective in reducing these effects. Children who had heard both factual explanation and a negative evaluation were less positive about the advertised toys and showed lower intentions to ask their parents to purchase them. However, this effect did not hold for the youngest children. Among the 5- and 6-year-olds, none of the comments were effective in reducing the effects of the

commercials. A possible explanation is that these children had not yet developed the necessary information-processing skills to process and apply the comments as a defense against the persuasive influence. These findings support the idea that reducing young children's exposure may sometimes be the only effective way to counteract negative effects of advertising.

Liking and requesting advertised products are intended and relatively direct effects of advertising. Yet unintended and longer-term advertising effects, such as materialistic orientations, can also be countered by parental communication strategies. Several of our studies have shown that in families that are characterized by conversation-oriented communication styles, applying both to advertising and more general consumer matters, children are less receptive to the impact of advertising on materialism than in low conversation-oriented and in conformity-oriented families (Buijzen & Valkenburg, 2005). In general, conformity-oriented advertising communication is the least effective strategy. A possible explanation is that in reality these policies do not lead to sufficient reductions in children's advertising exposure. As argued above, in our consumer society it is often unfeasible to avoid children being exposed to advertising. Even when restricted at home, children can be exposed directly in other contexts, but also indirectly via friends and relatives.

In our diary-survey study on the impact of food advertising on children's consumption behavior, we also found that conversation-oriented strategies were most successful in reducing the effect of advertising on children's consumption of unhealthy advertised food, particularly those related to advertising (Buijzen, 2009). The relation between advertising exposure and energy-dense food consumption disappeared for children whose parents actively discussed the nature and intent of advertising.

In addition, however, this study yielded more insights regarding conformity-oriented communication styles among younger children. To test the assumption that restrictive mediation could be successful among young children, we also compared the success of the various strategies among younger and older children. Our results confirmed that among the younger children in the sample (<8 years old), conformity-oriented advertising communication was successful in reducing the impact of advertising. Parental attempts to restrict their children's exposure to advertising may be more successful among young children, because parents still have control over their media exposure. Parental influence on children's television viewing behavior diminishes as children grow older, for instance because they watch television in their bedroom more often.

So far, these results were in line with earlier findings and assumptions. However, in contrast with previous findings, conformity-oriented communication about consumption was also very successful in reducing the impact of advertising. An explanation might be that when it comes to children's food consumption patterns, the family context plays a particularly important role (Kremers et al., 2006). Although children exert increasing influence on family purchases, parents are still the primary gatekeepers to children's food intake. In general, they are the ones controlling financial expenditures and making the final purchase decision in the retail environment (Mangleburg,

1990). In addition, most parents can control access to food at home, for instance by family rules on snacking and by determining what's for dinner (Cullen et al., 2001). In our study, conformity-oriented consumer communication strategies may have prevented children from gratifying advertising-induced desires.

It has to be noted that the success of conformity-oriented communication might be a short-term one. It is conceivable that in the long term, children benefit more from a conversation-oriented strategy. Earlier studies have shown that strict parental control practices diminish children's self-control in eating (Fisher & Birch, 1999). With increasing age, children obtain more autonomy in their consumption choices. Children from conformity-oriented parents may lack the nutrition-related knowledge to deal with that autonomy when they grow up, because their parents failed to explain the motivation behind their restrictions. Although speculative, this does suggest that the results for conformity-oriented communication should be interpreted with caution. It is plausible that socio-oriented communication is more effective, in the short term as well as the long term, when parents explain why they imply certain rules and restrictions. Overall, more research is needed to investigate the interaction between the various parental communication strategies, particularly between conformity- and conversation-oriented styles (cf. Fujioka & Austin, 2002).

Conclusions

In summary, our review of the literature suggests that advertising can have intended as well as unintended, possibly harmful, effects on children. These effects can be moderated by parents and caretakers, especially by using conversation-oriented strategies. Our conclusions might contribute to the ongoing political and sociolegal debate on child-directed advertising, and help establish guidelines for its regulation. In many Western societies, concerns about the possible adverse effects of marketing efforts directed at children have led to policies regarding child advertising. One kind of policy approach focuses on regulation and restriction of advertising, while another aims at educating children about advertising, mostly through school-based media literacy intervention programs. In recent years, several countries, such as the United States, the United Kingdom, Canada, and the Netherlands, have introduced such media literacy programs. Many studies have shown that media literacy programs can increase children's awareness, understanding, and critical attitude toward advertising (see Chapter 32, this volume).

Although increasing children's advertising and consumer literacy is important and necessary in our consumer society, literature suggests that literacy is not necessarily a defense against the persuasive influence of advertising. Applying critical defenses while being exposed to advertising requires a systematic level of processing and advanced information-processing skills. Up until the age of 12, most children have not yet developed the cognitive capacities to independently retrieve and apply their

knowledge as a defense against persuasion. In addition, they are more likely to process advertising in less elaborate ways, in which positive emotions and associations elicited by advertising are likely to overrule rational argumentation. Therefore, when trying to protect children from the possibly harmful effects of advertising, advertising literacy education is perhaps not the most effective policy.

However, the literature convincingly shows that parents and caretakers can effectively counter the undesired effects of advertising by critical discussion about advertising and by conversation and rule-making about consumption. Therefore, in our view media literacy programs should also incorporate parent-directed materials and focus, for instance, on raising parental awareness on advertising, consumer skills, and a healthy lifestyle. Not only is this a more effective way of increasing children's defenses, parents could also use some support in their battle against commercialism. Even though most Western countries have protective policies concerning child-directed advertising, the lion's share of the responsibility is still shouldered by the parents, who are usually the first to experience inconvenience as a result of advertising. Therefore, advertising-related policies could also be aimed at the empowerment of parents, by increasing parental defenses against advertising.

Finally, it is important to emphasize that parents and caretakers should not be considered as the only effective instrument to counter harmful advertising effects. First, literature suggests that parental communication efforts are not effective for all children. Specifically, children under the age of seven may benefit more from advertising restrictions. In addition, it would be unwise to invest in the empowerment of children and parents, while the commercial pressure is increasing, and advertisers keep developing more sophisticated methods to reach the child consumer. It cannot be denied that many of the advertised products are just too attractive to resist and that some marketing techniques, especially new embedded forms of marketing, are difficult to recognize and grasp – for children as well as adults. It is therefore of utmost importance that a fair and healthy media environment for children and their families is warranted, whether it is by self-regulatory or legislative policies.

Media Use, Scholastic Achievement, and Attention Span

George Comstock

ABSTRACT

Since the introduction of television, concern has mounted about the potential influence of television and other media on children's scholastic achievement. Can television and other media forms interfere in the development of skills necessary for successful test scores, grades, and other measures of academic achievement? Or, conversely, can media facilitate the development of such skills? In the current chapter, the research evidence pertaining to these questions is reviewed, exploring such related issues as whether television contributes to a diminished attention span, declines in fantasy play, imagination or creativity, or displaces time that could be spent with homework or other educational opportunities.

Media and Scholastic Achievement: Key Questions

The influence of mass media on the scholastic achievement of children and teenagers has been of prominent concern since the introduction of television in the 1940s (Schramm, Lyle, & Parker, 1961). Might television or other media in some way interfere with how well young people are performing on standardized tests as well as in school? Early empirically-based analyses emphasized the particular fit between

characteristics of the young person and the amount and kind of media use (Schramm et al., 1961); seventy years later, the same prescription remains valid. What the young person brings to the medium – motive, attitude, cognitive ability – remains as important as what the medium – content, style, message – brings to the young person. The situational and evidentiary differences, however, are enormous. Two questions have remained paramount:

- 1 What does media use imply for scholastic performance and the cognitive and behavioral skills on which it rests?
- 2 Where there are positive or negative associations between media use and a measure of scholastic achievement – such as grades or test scores – what are the explanatory mechanisms and processes?

These seemingly straightforward questions about the allocation of free time have become increasingly perplexing to answer. The variety, availability, and use of media have all increased, and there is now a much broader array of data on which to base conclusions. The media environment has been changing swiftly, with new platforms and portals, increased availability of media in homes, and in particular in the bedrooms of the young, and increases in the amount of time spent with media (Rideout, Foehr, & Roberts, 2010; Roberts & Foehr, 2004). It also is not clear that the criterion measure – the particular test or score (such as grades) chosen to reflect achievement – employed in some prominent studies has been sensitive to the media influence it was intended to capture. In addition, there is the suggestion in recent data that at least one long-standing pattern is dissolving.

Preeminence of Television

The stunning rise of newer media, in the public eye, has somewhat displaced the forest in favor of certain trees. Interpersonal and social applications of the Internet with their popularity and promise of profit-making understandably receive endless chronicling in the news media. Technological developments and the transient rise of new media “stars” – blogs, personalities, videoclips – entrance the public. Yet, extensive, reliable data warn that the emphasis on newer media may lead to a false impression of actual audience behavior and the media landscape.

Television easily remains the most-used medium among the young as well as those older. Estimated average daily viewing of television and related screen media by young persons of 4 hours 29 minutes dwarfs use of other media (Rideout et al., 2010). The figure for “live TV” (programming viewed on a TV set as it is telecast) is 2 hours 39 minutes; the remaining 1 hour and 50 minutes comes from recordings, videos, and other archival platforms.

The data not only record impressive use of television in both absolute (hours and minutes) and relative (proportions of media time and leisure) terms. They also record

Table 28.1 Media exposure and use over a decade: 1999–2009 (8- to 18-year-olds, hours: minutes)

Among all 8- to 18-year-olds, average amount of time spent with each medium in a typical day:			
	2009	2004	1999
TV content	4:29 ^a	3:51 ^b	3:47 ^b
Music/audio	2:31 ^a	1:44 ^b	1:48 ^b
Computer	1:29 ^a	1:02 ^b	:27 ^c
Videogames	1:13 ^a	:49 ^b	:26 ^c
Print	:38 ^a	:43 ^{ab}	:43 ^b
Movies	:25 ^a	:25 ^{ab}	:18 ^b
TOTAL MEDIA EXPOSURE	10:45 ^a	8:33 ^b	7:29 ^c
Multitasking proportion	29% ^a	26% ^a	16% ^b
TOTAL MEDIA USE	7:38 ^a	6:21 ^b	6:19 ^b

N (2009) = 2,002.

Statistical significance within rows: $p < .05$ (or less) when subscripts differ.

Total media exposure is the sum of time spent with all media. **Multitasking proportion** is the proportion of media time that is spent using more than one medium concurrently. **Total media use** is the actual number of hours/minutes out of the day that are spent using media, taking multitasking into account.

that the displacement of television in the expenditure of time by young persons has had a firmer basis in expectation and speculation than reality. Rideout, Foehr, and Roberts (2010) estimate media consumption across a 10-year period, from 1999 to 2009, using large, nationally representative samples of 8- to 18-year-olds (Table 28.1). Computer and Internet use as well as media consumption in total all increase substantially, as would be expected from news media accounts. However, contrary to much in the news, consumption of television and related screen media also increase. This unlikely outcome – because time is unhappily finite – has been made possible by an increase in the use of two (or more) media at the same time and use of newer, more convenient platforms. As a result, displacement of the older medium of television has been confounded.

Television and Achievement

In repeated instances since the introduction of the medium, amount of television viewing has been recorded as negatively associated with scholastic achievement, and

consumption of television remains prodigious among the young. The daily averages of more than 7 hours 30 minutes devoted to using media and 10 hours 45 minutes of exposure to various media a day among those 8- to 18-year-olds recorded by Rideout and colleagues (2010) include about 4 hours 30 minutes of exposure to television content.

There are six major sources – none of which by itself could be ignored – that together are compelling because of the size of samples, the diversity of subject matter, the range of grades, span of time covered, and the consistency of outcomes. They are:

- 1 The 1980 California Assessment Program (CAP) data, which include more than 500,000 fifth and twelfth graders.
- 2 The 1980 High School and Beyond (HSB) data collected by the National Center for Educational Statistics (Keith, Reimers, Fehrmann, Pottebaum, & Aubey, 1986), which cover more than 28,000 seniors.
- 3 The 1983–84 National Assessment of Educational Progress (NAEP) data collected by the Educational Testing Service (Anderson, Mead, & Sullivan, 1986), which include about 70,000 in three grades across the United States.
- 4 The pooling of data from eight statewide assessments by Susan Neuman (1988) that essentially replicates the CAP inquiry in seven additional states, and represents several million pupils.
- 5 The meta-analysis by Micha Razel (2001) that includes about 1 million pupils in elementary, intermediate, and high school, with a sizable number from several dozen foreign countries as well as more recent NAEP US data from the 1990s.
- 6 The analysis by Nary Shin (2004) of children age 6 to 13 in about 1,200 families drawn from the 1997 Child Development Supplement to the Panel Study of Income Dynamics (PSID).

These large data sets concur in recording that lower achievement has been associated with greater amounts of television viewing. The emphasis has been on reading and mathematics, but this negative relationship holds for every subject for which data has been obtained, including science and social studies and a thorough representation of the three basic skills of reading, writing, and mathematics. The negative relationship also held for a wide range of grades (in these data, from the fourth through the twelfth), represents more than three dozen countries and covers almost two decades (from 1980 to the mid-1990s).

The CAP data (see Figure 28.1) provide an excellent example because they cover the three basic skills, include two grades distant enough from one another to leave little doubt that the relationship is widespread, and rely on a census (rather than a sampling) of everyone attending school on the day of testing (282,000 in the sixth grade and 227,000 in the twelfth grade). CAP follow-ups in 1982 and 1986 document the same inverse relationship for social studies and science.

Number of students by socioeconomic status

Occupation of head of household	<u>Hours of television viewed per day</u>					Non- response	Total	Percent
	<u>0-1</u>	<u>1-2</u>	<u>2-3</u>	<u>3-4</u>	<u>4 or more</u>			
Professional	15,731	11,176	7,022	3,787	4,976	337	43,029	15
Semiprofessional	15,634	12,927	9,449	5,812	9,631	495	53,948	19
Skilled	23,713	21,283	16,966	11,301	21,795	1,189	96,247	34
Unskilled	10,408	9,391	7,591	5,211	11,451	769	44,821	16
Nonresponse	11,505	9,866	7,266	4,627	9,481	1,173	43,918	16
<u>Total</u>	76,991	64,643	48,294	30,738	57,339	3,963	281,968	100
<u>%</u>	27	23	17	11	20	2		

Figure 28.1 Survey of sixth grade achievement and television viewing habits, California Assessment Program (1980). Reprinted by permission from California Department of Education, CDE Press, 1430 N. Street, Suite 3207, Sacramento, CA 95814.

Those who viewed the most and recorded the lowest achievement scores were substantial in number, accounting for about one-fifth of the CAP sixth graders. Nevertheless, there are several important caveats:

- 1 Household socioeconomic status (SES) is positively associated with achievement, and this relationship is far stronger than the negative associations between viewing and achievement.
- 2 As household SES increases, the negative association becomes more pronounced (for example, for those whose head is classified as “professional”, the curve is noticeably steeper than for those whose head is classified as “semi-professional”) but the proportion who view the most and register the lowest scores remains substantial (about 15% among those “professional” and “semi-professional”).
- 3 The inverse association is somewhat more pronounced in the twelfth than in the sixth grade.

These data suggest a particular kind of substitution or displacement in which a scholastically less-valuable experience (television) takes the place of more valuable experiences (other media, other activities) because the former is more enjoyable. Viewing television is apparently more costly in terms of achievement as the value of alternatives (as indexed by SES) increases. It is also apparently more costly when school is more demanding, as exemplified by the steeper decline in the twelfth grade.

The proposed relationship is readily testable by Gaddy’s (1986) analysis of the HSB data. At issue was the role of the availability in the home of educational resources such as an encyclopedia, books, newspapers, and magazines (and were the data being collected today, presumably computer and Internet access, which would be more often available in upper SES households). A sample of about 10,000 from whom data were obtained when they were high school sophomores and seniors, confirms that resources in the home are part of the relationship (Gaddy, 1986). As Table 28.2 shows, the inverse association – over four measures of achievement: vocabulary, reading, mathematics, and grades – was consistently stronger when resources were more plentiful.

This pattern, in which the association between viewing and achievement depends at least in part on the character of foregone opportunities, has led Comstock and Scharrer (1999) to offer a tentative hypothesis:

Television viewing is inversely related to achievement when it displaces intellectually and experientially richer stimuli. Viewing is positively related to achievement when the stimuli it supplies are intellectually and experientially richer than the available alternatives. (p. 259)

These data obviously do not establish a causal relationship between viewing television and poorer scholastic performance. What they do establish unambiguously is an inverse association at the time of their collection between viewing and achievement.

Table 28.2 Educational resources and achievement

Achievement measure	Correlation coefficient ^a					
	<i>High resource</i>		<i>Medium resource</i>		<i>Low resource</i>	
	Sophomore	Senior	Sophomore	Senior	Sophomore	Senior
	N = 2,974		N = 3,960		N = 3,112	
Vocabulary	-.241	-.220	-.076	-.121	-.037	-.094
Reading	-.226	-.174	-.064	-.089	-.064	-.086
Math level 1	-.211	-.204	-.105	-.122	-.084	-.109
Math level 2	-.171	-.175	-.097	-.110	-.073	-.113
Grades	-.189	-.148	-.080	-.089	-.051	-.074

^aSmallest significant correlation (one-tailed alpha = .05, corrected for design effect) for high resource, .042; for medium resource, .036; for low resource, .041. Calculated using Fisher r to Z transformation.

N = 10,046

Source: Adapted from Gaddy, G. D. (1986). Television's impact on high school achievement. *Public Opinion Quarterly*, 50(3), 340–359.

The task is to explain this relationship. There is no convenient single study or recognized group of related studies that undertakes this mission. The remaining strategy, imperfect but unavoidable, is to pursue the several lines of separate inquiry that variously address this question and construct the most plausible answer.

Vanishing Relationship

Three analyses seemingly result in the disappearance of the negative relationship between the amount of viewing and achievement. Understandably, this vanishing is sometimes emphasized by reviewers (Schmidt & Vandewater, 2008). However, these three analyses, uniformly excellent at what they attempt to accomplish, do not address the central question of everyday television viewing and everyday school performance.

Gaddy (1986), using a sample of about 10,000 from the HSB data, examines the relationship between sophomore viewing and achievement – as measured by grades – in the senior year. The focus is on shifts in achievement over this two-year period. Initially, the association is negative. However, after controlling for a wide array of possible influences, the inverse association disappeared.

The problem, from the present perspective, is threefold. First, some of the control factors are likely to serve as the means by which television would influence achievement; for example, prior grades and educational resources in the home, both of which might have been suppressed by television use. Second, change in achievement

between the sophomore and senior years is a rather insensitive outcome (as so many students discover who would like to improve their grade point averages over the last two years of high school or college). Third, the longitudinal panel design ignores contemporary viewing, and individual viewing varies too much over such a three-year period for the sophomore measure to serve as a proxy for later years (Tangney & Feshbach, 1988). As a result, the analysis fails to address the issue of the relationship between viewing and achievement.

Gortmaker, Salter, Walker, and Dietz (1990), drawing on a nationally representative sample of 1,745 children from the National Health Examination (NHE) survey, analyze the relationships between television viewing and scores on the Wechsler Intelligence Scale for Children (WISC), the Wide Range Achievement Test in Arithmetic (WRAT-A), and in Reading (WRAT-R) over a four-year period. Again, after controlling for a wide array of possible influences, an initial negative correlation disappeared. From the present perspective, the problem is that when the earlier test score is entered as a control variable (as is the case here) the possibility of recording a change attributable to television – or anything else – is minimal. This is particularly the case with the WISC, which is intended to measure a trait and would confound expectations if it did not display stability over time.

Gentzkow and Shapiro (2008), similarly making use of an available body of valuable data (in this case, the 1965 national survey of achievement conducted by the sociologist James Coleman to assess the effects of racial segregation in public education), examined the relationships between test scores for five types of achievement in high school (math, spatial reasoning, verbal, reading, and general knowledge) and exposure to television in the preschool years. They were able to do this because of the television station-licensing freeze imposed by the Federal Communications Commission (FCC), beginning in the late 1940s to reexamine issues of spectrum assignment, which created community-level variation in access to the new medium. The analysis, drawing on the test scores of about 350,000 students, concluded that there was no negative causal contribution of earlier television to achievement those many years later, and that any effects probably were positive – and especially so for those from homes with fewer educational resources or where English was not the first language. The problem, from the present perspective, is that the analysis is confined to preschool access to the medium and adolescent achievement more than a decade later and does not examine contemporaneous adolescent viewing and achievement.

Curvilinearity

The question of curvilinearity is often justifiably raised because quite a few analyses report that achievement rises with increasing viewing before turning downwards (Fetler, 1984; S. Neuman, 1988, 1991; Potter, 1987; Razel, 2001; Williams, Haertel, Walberg, & Haertel, 1982). Yet, a glance at the massive – and thereby hard to discard

Figure 28.2 Achievement as a function of viewing time averaged over age. Reproduced with permission from M. Razel (2001). The complex model of television viewing and educational achievement. *Journal of Education Research*, 94(6), 371–379.

– CAP data for the sixth grade (again, see Figure 28.1) reveals only the scantest sign of curvilinearity.

Examination of the various sets of data discloses an interpretable pattern. In all instances, most of the curve is negative. When curvilinearity occurs (achievement scores rising with increasing viewing before descending), it is confined to the very early portion of the curve. An excellent example based on one million students is provided by the meta-analysis of six large-scale studies by Razel (2001; see Figure 28.2). Most of the slope is dramatically downward. And when curvilinearity does occur it is in the earlier grades. When high school and elementary school samples from the same study are compared, curvilinearity is largely confined to the younger ages. Again, Razel provides a graphic example (see Figure 28.3).

Curvilinearity, then, has been neither universal nor pronounced. It is a property of those younger; even then it is confined to the initiation of the curve, and is modest in magnitude. The data, in addition to indicating that viewing largely has been associated with lower achievement, also warn that television's role (and by reasonable extension, that of other media) may be quite sensitive to age.

Attention

One plausible explanation for a negative contribution by television viewing to achievement is that the undemanding pleasures of viewing interfere with the subsequent

Figure 28.3 Achievement as a function of viewing time at different ages. Reproduced with permission from M. Razel (2001). The complex model of television viewing and educational achievement. *Journal of Education Research*, 94(6), 371–379.

ability or willingness to pay attention in a classroom setting or focus on a task. This outcome has variously been labeled an attention deficit (which would be distinct from and less severe than the clinical diagnosis of attention deficit hyperactivity disorder, or ADHD; Schmidt & Vanderwater, 2008), impulsivity (Shin, 2004), or – in a useful if perhaps uninformative catch phrase – an “intolerance for schooling” (Hornik, 1981).

The pattern discernible in the data, which are confined to the viewing of young children, although certainly lacking the massive unanimity of the evidence on television and achievement, has three features (Anderson & McGuire, 1978; Desmond, Singer, & Singer, 1990; Geist & Gibson, 2000; Johnson, Cohen, Kasen, & Brook, 2007; Landius, Poulton, Welche, & Hancox, 2007; Salomon, 1979; Singer, Singer, Desmond, Hirsch, & Nicol, 1988; Singer, Singer, & Rapaczynski, 1984; Zimmerman & Christakis, 2007):

- The viewing of children’s educational programs by those of the ages for which the program was designed typically has not been associated with a decrease in measures of subsequent attention.
- The viewing of entertainment programs sometimes has been associated with decreases in measures of subsequent attention, and the viewing of violent programs in particular consistently has been associated with decreases in those measures.
- The viewing of television entertainment at an earlier age has often been associated with lower scores in later years on measures of attention, and this longitudinal relationship holds for all ages, including those who were adolescents as well as those who were of preschool age at the time of later measurement.

The evidence is largely correlational, but there are usually statistical controls for critical variables such as household SES. There also are experimental designs that unequivocally demonstrate contemporaneous causation for their particular circumstances. Two good examples are Geist and Gibson (2000) and Schmidt, Pempek, Kirkorian, Lund, and Anderson (2008), which together encompass distinctly different television stimuli and ages. In Geist and Gibson, the outcome measures were attention to and time spent on a task. About 60 fourth and fifth grade children were randomly assigned to three groups – no television, *Mr. Rogers' Neighborhood*, or *The Mighty Morphin Power Rangers*. Those who viewed the *Power Rangers* gave less attention to and spent less time on the task than the other two groups, which did not significantly differ on these measures. In Schmidt and colleagues, the outcome measure is similar – attention to and length of time engaged in play. However, the children were toddlers and preschoolers (12-, 24-, and 36-months-old) and the stimulus was background television displaying an adult game show. Although the children did not spend much time looking at the screen, play was disrupted to a small degree by the operating television set. The inference is the same in both cases: television (violent in one, irrelevant in the other) adversely affected attention and persistence.

These analyses address the question of whether the attentional effects apparently attributable to television achieve the threshold of a clinical diagnosis of ADHD. Christakis, Zimmerman, DiGiuseppe, and McCarthy (2004), using large samples (1,278 one-year-olds and 1,345 three-year-olds) drawn from a nationally representative data base, found that parental estimates of viewing at ages one and three predicted scores representing attentional deficits at age seven. Stevens and Muslow (2006), using a similarly large, representative sample, found no such link between television viewing at kindergarten age and ADHD at first grade age. Obel and colleagues (2004) in a much smaller Danish sample similarly found no link between viewing at age 3 years 6 months and ages 10 to 11. A key factor is whether the Christakis and colleagues analysis reflects ADHD. The claim by Stevens and Muslow that their labeling of symptomology is far too generous is quite telling – but doesn't erase the deficits in attention they found. The most reasonable conclusion is to harbor ADHD as a function of viewing with considerable skepticism (but not dismissal) while accepting the more widely supported pattern of interference in both the short- and long-runs with attention and persistence as consequences of television exposure.

Language and Vocabulary

There is hardly any doubt that television disseminates words and phrases as attested to by the widespread familiarity by persons of all ages with advertising slogans. Schramm, Lyle, and Parker (1961) convincingly documented this phenomenon in their large-scale study of the effects on children of the introduction of television.

Those in communities with television were about a year advanced in vocabulary compared to those in communities yet to receive the medium. However, three decades later, Williams (1986) and colleagues were surprised to find no signs of vocabulary gains in a remote community newly receiving television. Their choice of instruments was impeccable – the Peabody Picture Vocabulary Test (PPVT), the vocabulary subtest of the Stanford-Binet (S-B), and the vocabulary subscale of the Wechsler Intelligence Scale for Children (WISC). Each was a recognized, widely used measure. Not one registered an increase attributable to the arrival of television.

The explanation almost certainly rests in part with the focus and initial purpose of the tests and in part with changes in the media environment. These tests by design measure general vocabulary, and thus would exclude the words and phrases most likely to be newly brought to the community by television – the glossaries of news, sports, entertainment, and advertising. In addition, by this time (the 1980s) television was so commonplace that words and phrases introduced by the medium would be disseminated to non-viewers and infrequent viewers by word of mouth.

There nevertheless remains the power of television to teach new words and phrases directly when the medium purposefully introduces them to receptive audiences, as happens with children in the case of educational programs and just about everybody in the case of advertising. Many studies attest to this success (Linebarger & Walker, 2005; Rice, 1990; Rice, Buhr, & Otting, 1992; Rice, Huston, Truglio, & Wright, 1990; Rice, Oetting, Marquis, Bode, & Pae, 1994). However, Naigles and Mayeux (2001) in their review make the important distinction between lexical development (words) and grammatical development (rules). Educational television can present words clearly, repeatedly, and consistently in regard to usage, all effective devices to enhance learning. The teaching of grammar, as Naigles and Mayeux argue, in contrast is more dependent on interaction with a parent or caregiver and the consequent reinforcement of correct responses, and thus there is no comparable research record of media effectiveness.

The manner and content of presentation certainly matters. Linebarger and Walker (2005) compared vocabulary acquisition for very young children (age two-and-a-half) and found measurable differences for various educational programs, with *Blue's Clues* and *Dora the Explorer* in this instance having greater impact than *Sesame Street*. It also must be acknowledged that children from lower SES households are particularly likely to rely on television for exposure to stimuli related to language. For example, Neuman and Celano (2001) in comparing middle class and low-income neighborhoods found the latter starkly sparser in circumstances that would promote reading (including such prosaic aspects as signage, children's and young-adult books for sale, and places conducive to reading) and Jordan (2005) in a small sample of low-income children found that they did not differ much (Rideout, Vandewater, & Wartella, 2003) in the regularity of being read to but that the amount of time spent on this activity was much less and television viewing was much greater, reaching about six hours a day on weekends.

Television, then, is an accomplished teacher of vocabulary under certain conditions. When television was introduced, access to an operating set equaled those conditions – new words and a naïve audience. They remain in place among children viewing educational programs. Children – and the population in general – have enhanced vocabularies as a consequence of the presence of television, but exposure itself (as was the case in the data of Schramm and colleagues) is no longer a necessary condition (as Williams and colleagues document).

Creativity and Imaginative Thinking

Television has been hypothesized to restrain creativity and imaginative thinking by three means: the foreclosure of imagination by the specificity of visual imagery; the rigid exposition of narratives that allow no time for personal reflection; and the conventionality of its themes, plots, and roles. The evidence comes from experiments (Greenfield & Beagle-Roos, 1988; Greenfield, Farrar, & Beagle-Roos, 1986; Kerns, 1981; Meline, 1976; Runco & Pezdek, 1984; Valkenburg & Beentjes, 1997; Vibbert & Meringoff, 1981; Watkins, 1988), surveys (Childs, 1979; Peterson, Peterson, & Carroll, 1987; Singer et al., 1984; Zuckerman, Singer, & Singer, 1980) and a quasi experiment (Williams, 1986) in which a community newly receiving television was compared with two communities that had been able to access the medium for many years.

The quintessential experimental comparison has been with stories that are read or heard. When asked to complete a story, children typically add less on their own to something seen on the screen than to similar stories read or heard. This effect, recorded repeatedly, is nevertheless better interpreted as a transient state than the inculcation of a trait. The nature of experiments, in which the less creative group would have been the more creative had assignments been reversed, compels such a conclusion – unless it can be demonstrated that such short-term effects would aggregate to a long-term deficit.

However, the quasi-experimental data of Williams and colleagues largely foreclose such a likelihood. In their three communities, one of which was receiving television for the first time, there were no significant associations between amount of viewing and creativity scores in the two communities that had access to television for many years, and in the community where television was new there was a small negative association on only one of the two major, recognized tests of creativity employed.

The ambitious experiment by Watkins (1988) importantly enlarges the picture. He asked third, fifth, and eighth graders to write stories that reflected either television or real life. The television stories were actually more elaborate and introduced thoughts and emotions on the part of the characters more often, and this was particularly the case for those who were heavier viewers of television.

The data overall lead to three conclusions, which depict a more nuanced and positive role for television in creativity and imaginative thinking than their hypothesized curtailment:

- 1 Young children, when asked to elaborate on a televised story will invent, embroider, and expand less than when the same story has been conveyed orally or in print – probably because the explicit visual images on the screen leave less need or room for imaginative innovation.
- 2 The documented suppression of creativity and imaginative thought – as measured by elaboration – is transient, and represents a state subject to changing circumstances rather than the diminishment of a trait.
- 3 When asked to engage in the creative and imaginative task of storytelling, television viewing among older children promotes more extensive effort, greater complexity, and the attribution of more thoughts and emotions to invented characters, although these tales are likely to conform to the conventions of television storytelling.

The varied evidence does not support effects leading to chronically greater or lesser degrees of creative and imaginative thought. In contrast, the evidence largely supports the view that television (and by implication, other screen media) gives shape and substance to the expression of creative and imaginative thought.

In Search of Explanation

None of the findings reported so far are satisfying in explaining the documented inverse association between amount of television viewing and scholastic performance. One does not have to stray far, however, to find a thoroughly convincing reason why those who view more fare less well on tests of achievement: heavy viewers, as a group, include a disproportionate number of young people whose attributes or behavior lead to poorer academic performance.

Comstock and Scharrer (1999, 2007) specify two factors that have had a particularly large role: mental ability and socioeconomic status (SES). Mental ability, measured by IQ tests, is inversely associated with amount of television viewing (Gortmaker, Salter, Walker, & Dietz, 1990) and, as one would expect, is positively associated with doing well in school. SES behaves similarly. Lower SES predicts lower performance in school (Fetler, 1984) and for decades has predicted greater amounts of television viewing (Comstock & Scharrer, 2007). In both cases, characteristics of the young person offer an explanation for the inverse association between viewing and achievement.

The links between mental ability and television viewing and between SES and television viewing are now somewhat weaker than they once were, because of the historical trend toward greater viewing by all population segments (Comstock & Scharrer, 1999), but are far from erased. They decidedly were well in place at the time of the collection of the CAP and other large sets of data. In the case of SES, even when there is an attempt to take it into account (as occurs when the CAP data are arrayed by occupational strata) SES will remain a factor within strata and thereby a potential explanation for any observed relationship between greater viewing and lower achievement.

Then there is the role of stress and conflict. Comstock and Scharrer (1999, 2007) draw from a number of different studies in concluding that children and teenagers who are troubled, worried, or quarreling with others are likely to turn to television as a source of relief. These same factors also are likely to lead to poorer performance in school. Again, characteristics of the young person offer an explanation.

The question is whether these undeniably influential forces are sufficient to account wholly for the kind of declining achievement curves visible in the CAP data. The answer lies in a large body of studies that disclose a variety of ways in which television may negatively affect scholastic performance.

Displacement

The displacement hypothesis, broadly phrased, holds that television takes time away from the maintenance and practice as well as the acquisition of the three basic skills – reading, writing, and mathematics (Comstock & Scharrer, 2007). In a narrower formulation, it has focused on reading (and in particular acquisition of the ability to read in the first to the third grades), for which television as a less demanding but equally sedentary (and similarly rewarding) activity would seem a formidable competitor that could extract a long-term and possibly lasting deficit in a crucial skill (Williams, 1986).

Shin (2004) provides an important test of a general form of the hypothesis by examining the role of several potentially competing factors in her analysis of about 1,200 families with children between the ages of 6 and 13. Overall, she found a modest negative correlation between viewing and achievement scores for reading and mathematics. She sought a variable in the available data (which were not collected for her purposes) that would test the displacement hypothesis, and found one in homework and study. As her path diagram shows, time spent on homework and study was suppressed by viewing but was positively associated with achievement (see Figure 28.4). Thus, her data support the view that television adversely affects achievement by taking time away from school-related activities.

Interference

Armstrong and Greenberg (1990) in an experiment found that mental tasks done in the presence of an operating television set were inferior in quality. Those working in the company of the operating set scored lower in reading comprehension, spatial problem-solving, and cognitive flexibility. Shin in her sample of 6- to 13-year-olds found that impulsive behavior was slightly (but positively) correlated with viewing and was decidedly (if modestly) predictive of poorer performance. Koolstra and van der Voort (1996) in a sample of more than a thousand Dutch second and fourth graders found that those who viewed more invested less mental effort in reading, and this occurred after statistically eliminating the influence of mental ability as well as other variables. D. G. and J. L. Singer and colleagues (Desmond et al., 1990; Singer et al., 1988; Singer et al., 1984) consistently have found that viewing violent programming by very young children leads to problems of impulse control in the early grades. Interference by exposure to television with the quality of cognitive activity, and particularly with concentration and attention, is thus a candidate as a potential cause of the lowered scholastic performance by those who view more.

Socialization

The effects of television on reading by the young are not necessarily limited to decreases in time spent or amount of invested mental effort. They also arguably may

include a variety of shifts in attitudes and tastes and preferences that influence not only the disposition to engage in reading but the types of material chosen to read, and thereby the rewards and satisfactions that reading will supply.

Morgan (1980) found in a large sample of adolescents that greater viewing was correlated with a preference for print media that featured entertainment stars and tales of teenagers. Koolstra and van der Voort (1996), of course, found among their second and fourth graders that greater viewing was associated with the expenditure of less mental effort when reading. They also found that the greater the viewing at an earlier time, the more likely these young people would choose comic books as favored reading and the more likely they would categorize books as dull, boring, and unrewarding.

These findings fit rather nicely with those of W. R. Neuman (1982). He found that people in general – he interviewed adults – mostly thought about the entertainment value and execution of programming while viewing rather than the social or moral implications of the content. The medium in effect cues rules about storytelling. This may have some positive aspects for children and adolescents when engaged in constructing narratives, as documented in Watkins' (1988) experiment, but it may also lead to the embrace of the banal and trivial (if temporarily absorbing and even occasionally exciting).

Process

These various findings are integrated in Figure 28.5, which draws together evidence from a variety of sources and assigns a role both to the characteristics of the young person (which irremediably lead to the expectation that on the average those who view more television will perform less well on tests of scholastic achievement) and to the more speculative negative influences of the medium (which appear to identify television viewing as contributing to lowered scholastic performance). Two concepts are added to those already introduced – centrality of television and other screen-related media in the home, and orientation toward the set, dichotomized somewhat arbitrarily into instrumental and ritualistic viewing.

Signs signify the direction of the expected relationship (+, –), and the number of signs the apparent (if subjectively judged) strength. The emphasis or explanatory weight is greatest for the characteristics of the child, evident in the factors and weights arrayed on the left side (and especially SES and mental ability). At middle left, the concept of household centrality of television is introduced as a fairly powerful explanatory factor for amount of viewing. This dimension, which varies substantially across households, represents the degree to which sets are constantly on, few if any rules or restraints constrain viewing, and viewing essentially is continuous throughout the day, and has proved to be a predictor of viewing independent of SES (Comstock & Scharrer, 1999, 2007; Rideout et al., 2010; Roberts & Foehr, 2004). The intent is to make explicit the role of household-level norms.

Figure 28.5 Path model: viewing, household and individual variables, and scholastic performance. From G. Comstock & E. Scharrer (2007). *Media and the American child*. San Diego, CA: Elsevier.

The possibly detrimental influences of television are represented largely by factors on the right, beginning with a specific instance of displacement (“Reading outside of assignments”) and continuing through another example of displacement (“Time spent on homework . . .”) and an instance of interference (“Time spent on homework with television”) and include two examples of attitudes of cultural socialization attributable to television (“Low esteem for book reading” and “Preference for banal material”). These are all factors empirically found to have been influenced by greater or lesser viewing, and each also has been found to have consequences for achievement.

Orientation toward the medium is introduced at the upper right. Rubin (1984) proposed the concepts of instrumental versus ritualistic use of television to distinguish between motivated, focused, interest-driven attention to specific content and viewing representing the desire to kill time, watch some television, or engage in a routine habitual for the time of day and circumstances. Motive affects not only attention to content but the kind of content chosen. Instrumental viewing that is selective and based on interests more often will lead to content that is emotionally and cognitively more demanding and sometimes more informative, and as a result can

enhance achievement. Unhappily, ritualistic viewing accounts for the majority of viewing (Comstock & Scharrer, 2007).

Looking Ahead

Television viewing – with the rare exception – has been consistently recorded as a modest negative correlate of academic achievement. There also have been empirically based justifications for taking at least the possibility of a causal contribution seriously.

Other Media

There have been comparatively little data collected on the systematic influence on scholastic performance of the quantity of consumption of media other than television, primarily because among the young (as well as other demographic groups) none has rivaled television in access, popularity or amount of time allocated. An exception are the recent national Kaiser Foundation surveys (Rideout et al., 2010; Roberts & Foehr, 2004; Roberts, Foehr, & Rideout, 2005), which comprehensively collected data on all media – screen, audio, and print.

The measure of achievement was self-reported grades for the nationally representative samples of 8- to 18-year-olds. This is not a strong measure compared to actual recorded grades or scores on standardized achievement tests, which were the criteria in the major data sets reviewed so far. It risks obscuring effects by grade inflation (in the most recent survey, almost two-thirds claimed “mostly As and Bs”). At the same time, it makes any relationship particularly convincing because such an upward migration would make any associations harder to find.

In the most recent survey, conducted in 2009 (Rideout et al., 2010), amount of media use overall (of which the largest component is television content, however disseminated) was negatively associated with grades. Media use overall was also positively associated with various measures of unhappiness and lower self-satisfaction. In both cases these relationships withstood statistical controls for important other variables.

Nearly half (47%) of all heavy media users said they usually got fair or poor grades (mostly Cs or lower), compared to 23% of light media users. Heavy media users were also more likely to say they got into trouble a lot, were often sad or unhappy, and were often bored. Moreover, the relationships between media exposure and grades, and between media exposure and personal contentment, withstood controls for other possibly relevant factors such as age, gender, race, parent education, and single versus two-parent households (Rideout et al., 2010, p. 4).¹

In contrast, print use, defined as “reading for pleasure” to set it apart from school-related media use, was positively associated with grades. The average for the 8- to 18-year-olds in 2009 was 38 minutes a day (compared to the four-and-a-half hours for screen media), with those who did read spending a more impressive 57 minutes. The relationship with grades was modest but decidedly positive: among those who read the most, 72% received high grades while the comparable figure for those classified as reading the least (or not at all) was 60%.

These data, more than six decades after the introduction of television in the late 1940s, record not only impressive, substantial increases in the amount of media consumption by the young but also three persisting (and therefore also noteworthy) patterns. The first is the negative association between media use and scholastic performance, with media overall in these data now substituted for television. The second is the appearance of personal discomfort as a factor in the amount of media use that might also interfere with scholastic performance; this is consistent with the well-known, often recorded positive association between stress and use of television (Comstock & Scharrer, 2007). The third is the identification of print use as contributing positively to academic achievement, a factor occupying a prominent place in the model (again, see Figure 28.5).

The data overall lead to the conclusion that time spent with media, and in particular television and other screen media that are the major components of media exposure and use, depress scholastic achievement. To dismiss this possibility is to ignore not only those many negative correlations and the often huge samples on which they are based (which could be justified by invoking the characteristics of the child), but also to dismiss the concepts of displacement, interference, and socialization. The Kaiser data do not absolve television and screen media because of the weakness of the achievement measure, but they do hint that the pattern of the past several decades may be changing.

Those most at risk would seem to be the 20% or so who are the heaviest viewers. This is certainly the group where achievement scores of all types are the lowest (again, see Figure 28.1). However, this is probably too simplistic. This group that registers the greatest deficit in achievement is also certain to contain many of those with characteristics that predict both greater viewing and lower achievement. The crucial factor is the opportunity cost of a particular mode of media consumption. Thus, those at risk cannot be identified by amount of media use alone.

Amount of viewing inevitably raises the question of content. As Schmidt and Vandewater (2008) sensibly argue in their review, the effects of how much is viewed depend partly on what is viewed. The data examined here represent what is ordinarily viewed and do not reflect what might have occurred had other viewing choices been made. Thus, content matters. Overall amount of viewing by children and teenagers has been negatively associated with achievement while the viewing of educational programming, when incorporated in the research design, has positively predicted achievement. The explanation (at least to an important degree) is that overall viewing has usually been dominated by entertainment. This factor is made explicit in the

model (Figure 28.5) by the concepts of instrumental and ritualistic viewing, where instrumental viewing is a positive predictor of achievement (and is intentionally broad enough to encompass a wide range of content as long as its viewing is motivated by interest).

The increasing similarity of social strata and demographic groups in use of screen media (with use greater for most), a long-term historical trend (Comstock, Chaffee, Katzman, McCombs, & Roberts, 1978; Comstock & Scharrer, 1999), implies that negative correlations with achievement scores will weaken (because those with stronger social and intellectual credentials for achievement will be spending more time attending to those media). Displacement may lose some of its force in response to conceivably better time management and a higher proportion of instrumental viewing among the recent recruits to greater screen use. Quite possibly, this is what has already been observed in the Kaiser Foundation surveys (Rideout et al., 2010; Roberts & Foehr, 2004; Roberts et al., 2005). In turn, the positive role for print is likely to be diluted by electronic media, whose informational role will be somewhat obscured by the large proportion of electronic media use devoted to personal and social communication. The pursuit of relationships between use of specific media and scholastic performance will become ever more problematic – and possibly hopeless – as the conditions and circumstances on which such relationships rest fade away.

NOTE

- 1 Heavy media use was defined as more than 16 hours of exposure per day (about one-fifth of the sample); moderate = 3–16 hours; light = fewer than three hours (slightly fewer than one-fifth of the sample).

The Educational Impact of Television

Understanding Television's Potential and Limitations

Daniel R. Anderson, Heather J. Lavigne, and Katherine G. Hanson

ABSTRACT

Watching and understanding television requires the development of attention, media decoding, and narrative comprehension skills. Children under the age of two years have difficulty using televised information to effectively guide their behavior, a phenomenon known as the video deficit. Beyond the infant and toddler years, however, television can become a powerful tool for education. Programs designed with specific educational objectives and research-based curricula promote academic achievement and prosocial behavior. Educational television is an important asset for children's informal learning during the preschool years and beyond.

Television as an Educational Tool

Even before television was first broadcast as a mass medium, commentators expressed hopes and fears about its impact on education. On the one hand, TV could be a window to the world, and on the other, it could be an endless distraction from productive and sustained learning. This debate has hardly waned more than 60 years later – in fact, it has been extended to other electronic media. In this chapter, we

review the current state of understanding about children's learning from television. Our review here is limited: we only consider the impact of television programs, such as *Sesame Street* or *Blue's Clues*, that intentionally incorporate a curriculum in their design with specific educational objectives aimed at fostering cognitive, social, academic or school-readiness skills among its viewers. That is, we do not review research on the effects of purely entertainment programming (for a review see Chapter 28, this volume). We also do not review research on the use of educational television in the classroom or other formal learning situations. Instead, we focus on educational television that is experienced at home during so-called "informal learning."

We first provide a brief task analysis of television viewing in order to highlight cognitive skills necessary for comprehension and learning (see Anderson & Hanson, 2010 for a detailed analysis). For infants, television comprehension is a demanding task and is probably beyond their capabilities, even when considering educational programs and baby videos. We argue that only after about 2 years of age can TV truly become educational. Consequently, we divide the research literature into educational television impact before and after the age of 2 years.

The Task of Watching Television

The Medium

Watching television is not akin to watching events unfold through a window. Even with large-screen high-definition displays, televised events are confined to a restricted space that is visually and auditorily inferior to equivalent real-life experiences. Television screens fail to give us the sense of depth and "presence" found in everyday life. For example, TV does not afford its viewers with binocular depth perception, which arises from the brain's ability to extract distance information from the slightly disparate views of our two eyes when we look in three-dimensional space. Especially for infants and toddlers, television's impoverished images can lead to poorer encoding, retention, and transfer of information to everyday life.

Television is also limited because it cannot provide its viewers with contingent and responsive feedback. It is widely theorized, with empirical support, that very young children learn best through hands-on experience, actively manipulating objects in their environment as well as engaging with people in their world (Piaget, 1952; Vygotsky, 1978). In turn, these interactive experiences provide children with the knowledge to adaptively modify their future behaviors. This behaviorally active learning process is constrained during television viewing.

The Codes of Television

Television programs are structured by a set of conventions that organize the audio-visual flow of sounds and images into a coherent narrative. To media researchers,

the audiovisual production and editing techniques, such as sound effects, pacing, and dissolves, are known as the formal features of television. These features are effectively the grammar and syntax of television that mark scene and content changes, while fostering continuity across these changes (Huston & Wright, 1983). Formal features have an informative function ranging from calling attention to a particular part of the screen to simulating cognitive processes such as paying close attention to a detail (as in a shift to a close-up shot). Auditory changes and fast-paced motion tend to attract attention to the TV if the viewer is looking away (Alwitt, Anderson, Lorch, & Levin, 1980). Editing techniques can signal a change in perspective (as from one character's point of view to another) or a change in time and space (dissolves to infer a change in time). The interpretation of transitions calls upon prior experience with the medium, general world knowledge, and complex cognitive skills including an understanding of continuity in action sequences, time, point of view, and intentions, to name a few. Consequently, young children's ability to learn from television can be compromised by their limited cognitive abilities and lack of experience with the world in general and with television in particular. However, well-designed children's programs use specific production and editing techniques to support children's learning from television. For example, simply minimizing the number of transitions can help reduce children's cognitive load and possible confusion (Anderson, 2004).

Attention to Television

It is a misconception that children are mesmerized by television. In fact, they pay widely varying amounts of attention to TV, depending on a variety of factors. A typical viewer of *Sesame Street*, for example, will look at and away from the screen about 150 times in the course of an episode (e.g., Anderson, Lorch, Field, & Sanders, 1981). To learn from television, therefore, children need to look and listen at the right times in order to fully understand the narrative or lesson. They must also look at the most informative place on the screen during each portion of the program. The process of learning how to watch television is reflected in the increase in looking at TV across early childhood. Looking at television increases with age as children gain more control over their ability to selectively allocate their attention during the first five years of life (Ruff & Rothbart, 1996). It also increases as children become capable of understanding television content (Pempek et al., 2010).

Higher-Level Comprehension of Television

Children must not only learn how to decode the forms and features of television, but they must also understand the educational material presented on television. High-level comprehension of program content requires cognitive skills ranging from basic comprehension of language to comprehension of stories (e.g., story structure and components, character motivations, cause and effect, etc.).

Since children usually watch TV to be entertained and not educated, learning is often incidental rather than intentional. Fisch (2000) proposed that the two types of content – entertainment and education – result in two parallel streams of cognitive processing that place separate demands on children's limited working memory. Therefore, greater integration between the entertainment and education content within a television program will reduce the cognitive demands of viewing and bolster children's comprehension.

In summary, to create meaningful programming for children, there must be an appreciation of the complexities involved in watching television. For adults, watching television is a relatively easy activity; however, for young children, watching television is challenging given that they are limited in their cognitive abilities, real-world knowledge, and experience with the medium. Thus, for a television program to have a positive impact, the production team should undertake program development with an understanding of children's developmental abilities and perspectives.

Television Viewing among Infants and Toddlers

In 1998, *Teletubbies* debuted on PBS. It was the first television series made specifically for infants and toddlers. Since then, infant-directed television series and videos, such as the highly popular *Baby Einstein* videos, have become a multibillion dollar industry (Garrison & Christakis, 2005). Recent studies indicate that children begin to watch and are regularly exposed to television around nine months of age (Linebarger & Walker, 2005). Approximately 61% of infants under the age of two watch television on a daily basis, consuming an average of one to two hours each day (Rideout & Hamel, 2006).

Many baby videos and TV programs have made either explicit or implicit claims to enhance children's cognitive development (e.g., *Brainy Baby* series). However, unlike educational programs for preschool children and older, there are no available studies to support the producers' claims. In fact, a handful of studies have tested the educational efficacy of baby videos and have not found any developmental or learning benefits. In a naturalistic study, for example, Robb, Richert, and Wartella (2009) provided families of 12- to 15-month-olds with an infant-directed video, *Baby Wordsmith*, to view in the home over a 6-week period. Although this video features word learning, infants who viewed the video did not increase their receptive or expressive language with featured words relative to infants who were not exposed to the video.

Moreover, it is unclear how much infants and toddlers actually comprehend from infant-directed videos given the complexities involved in watching television. Although infants are born with a relatively precocious auditory system, their visual system at birth is poor with limited visual acuity, color and contrast perception, and object tracking, to name a few (see Slater, 2001 for a review). At least for several months after birth, it is unlikely that infants can perceive much on a television screen at a typical viewing distance. Despite these early perceptual immaturities, there are

many baby videos targeting infants as young as three months. By six months, however, the infant visual system is mature enough to see the television screen. At this age they can also recognize objects, characters, and actions on screen, and match the audio track to the visual stimuli (e.g., Tincoff & Jusczyk, 1999). Nevertheless, even with these perceptual abilities, infants' ability to learn from television is compromised by their limited cognitive abilities and lack of experience.

We are just beginning to understand the extent to which infants comprehend television. As an example, Pempek and colleagues (2010) showed 6-, 12-, 18-, and 24-month-olds comprehensible and incomprehensible versions of *Teletubbies*. All children watched a 10-minute comprehensible version of *Teletubbies*. In addition, half of the children viewed a version of *Teletubbies* that consisted of the same shots placed in random order, while the other half viewed a version of *Teletubbies* that was linguistically distorted (each utterance was reversed). Six- and twelve-month-olds did not discriminate among these different versions in terms of their attention. Only at 18 months of age did it seem to matter to the infants whether the program made sequential or linguistic sense. It is likely that the cognitive mechanisms important for basic TV comprehension skills (e.g., linguistic comprehension and comprehending the relationships between successive shots) are not available until about 18 months of age and older.

Does Television Have an Educational Impact on Infants?

Much of the current research on infants' learning focuses on their *inability* to learn from screen media. Even with simple unadorned video used for research, children under 2 years demonstrate a deficit in learning from television compared to learning from an equivalent live display. This phenomenon is known as the *video deficit* (Anderson & Pempek, 2005). Young children for example, are less likely to imitate simple behaviors from television, like putting a rattle together, relative to watching someone put it together in person (e.g., Barr & Hayne, 1999). A number of theories have been proposed to account for the video deficit; none of them are mutually exclusive, and all highlight the complexity involved in TV viewing.

One account of the video deficit emphasizes the perceptual impoverishment of television relative to real-life experiences (Schmitt & Anderson, 2002). Compared to live demonstrations, televised displays lack the dynamic and perceptual richness of everyday life resulting in potentially weaker mental representations (Schmitt, 1997). These perceptual differences may make it particularly difficult for children to transfer knowledge from television to reality. There is some evidence that differences in dimensional space result in poorer transfer of knowledge across dimensions (2D to 3D or 3D to 2D), but not within the same dimensional space (2D to 2D or 3D to 3D; Zack, Barr, Gerhardstein, Dickerson, & Meltzoff, 2009). Another study by Carver and

colleagues (Carver, Meltzoff, & Dawson, 2006) found that 18-month-old infants reliably discriminated between familiar and unfamiliar objects in both video (2D) and live (3D) conditions. Nevertheless, infants took longer to process familiarity differences during the video presentation compared to the live presentation, suggesting that young children need more time to encode information from video.

Another theory posits that infants and toddlers may not learn as much from television because they do not have an appreciation of its symbolic nature (Troseth & Deloache, 1998). That is, they do not understand the fact that television provides symbolic (or more accurately iconic) representations of objects and events that may (or may not) exist in the real world. This results in a failure to understand the correspondence between television and reality, an ability that does not reliably emerge until about three years.

Attention differences may also contribute to the video deficit. Children may find video presentations less engaging than real-life presentations (Diener, Pierroustakos, Troseth, & Roberts, 2008). As a result, they may pay less attention to television and be more likely to miss key pieces of information necessary for comprehension. Furthermore, even if young children pay attention to the video, it does not mean that they are paying attention to the right thing at the right time. Using eye-tracking methodology, Kirkorian, Anderson, and Keen (2008) found that one-year-olds' attention to what they look at while viewing a *Sesame Street* segment is highly variable across infants compared to four-year-olds and adults, who were more likely to look at the same thing at the same time. The older viewers are more likely to look at informative aspects of the display based on their understanding of the program.

Although infants and toddlers have difficulty learning from television, there are techniques that can be used to ameliorate the video deficit. Repeating content can support young children's learning by providing them with more opportunities to encode information (Barr, Muentener, & Garcia, 2007). In addition, verbal labeling, either through voiceover or with a covieing parent, helps children by scaffolding the viewing experience, highlighting important events onscreen (Brand & Tapscott, 2007). The viewing context and experience with television as a source of information are also important factors in reducing the video deficit. Two-year-old children, for example, performed worse on a simple imitation task when they viewed the demonstration on a television set at home compared to children who saw the same video demonstration in the laboratory (Strouse & Troseth, 2008). In contrast, those infants presented with a live demonstration (either at home or in the lab) did not differ in performance. This difference between home and the novel context of the laboratory may result from children's experience with television at home as essentially being irrelevant to their real-life experiences. In addition to viewing context, establishing an interactive relationship with young viewers through video also facilitates children's learning (Troseth, Saylor, & Archer, 2006). Relatedly, Lauricella, Howard, and Calvert (2010) found that with 21-month-olds, a familiar TV puppet was a more effective model for demonstrating nesting cups than an unfamiliar TV puppet.

Finally, coviewing with a parent may be an important factor in infant learning from television. Lemish and Rice (1986) found that television viewing can be a rich experience between parents and children, similar to book reading. Barr and colleagues (Barr, Zack, Garcia, & Muentener, 2008) found that parents who labeled objects on screen (“That’s green”) and questioned their children (“Where is the dog?”) while viewing had young toddlers who attended to and responded more to the television program.

That said, the research literature still lacks any demonstration that children under 2 years of age actually learn anything of value from watching commercial television programs or videos (in contrast to some demonstrations of infant learning from simple research videos). In fact, there has been little rigorous research to evaluate baby videos specifically designed to be educational. Moreover, video viewing by infants is a matter of some controversy. Recent correlational studies are suggestive that early television exposure during infancy is related to poorer cognitive outcomes (Anderson & Pempek, 2005). Furthermore, the American Academy of Pediatrics (1999) recommends that children under 2 years have no screen exposure based on the assumption that TV viewing displaces important social interactions necessary for development.

In summary, television viewing is an active and complex task that requires cognitive maturation and real-world experience. Not surprisingly, very young children have difficulties learning from television. Although there are techniques that support infant and toddler learning from television, there is very little research to show that they learn anything of substance.

Preschoolers and Television

During the preschool years (2 to 5), consumption of screen media greatly increases and then remains high throughout later childhood and the teenage years (Rideout, Vandewater, & Wartella, 2003). With age from infancy to the school-age years, TV viewing encompasses a wider variety of content, moving from predominantly child programming to general audience and adult programming. In a survey conducted in 2005, it was reported that 82% of 3- to 4-year-olds and 78% of 5- to 6-year-olds watched television on any given day (Vandewater et al., 2007). Viewing does not just happen at home; preschool children in home-based childcare programs watch approximately four times as much television than those in center-based programs (1.39 hours per day versus .36 hours per day; Christakis, Garrison, & Zimmerman, 2007).

Once established, media consumption patterns from childhood are consistent throughout life. Those children that are “heavy viewers” will most likely continue to be heavy media users later in life (Rideout et al., 2003). Educational television probably has its greatest influence during the preschool years because most children

watch substantial amounts of TV, they are not yet engaged in formal schooling, and they have become capable of understanding well-designed educational programs. In addition, brain development continues at a rapid pace during the preschool years with the consolidation of many basic cognitive abilities occurring during this time.

Preschoolers' TV Viewing: A Task Analysis

As indicated above, the act of watching television becomes easier with greater capabilities in cognitive control and comprehension. With maturation, preschoolers can rapidly process the formal features of television and also recognize television as a relevant source of information.

Auditory Attention

Based on videotapes recorded in homes, preschoolers spend a third of their time or more when watching TV doing things other than looking at the screen (Anderson, Lorch, Collins, Field, & Nathan, 1986). Often, preschoolers divide their attention between television and other activities such as toy play. Because a great deal of information critical to comprehension is presented via the audio track, it is important to determine to what extent children listen to the TV when they are not looking.

Lorch, Anderson, and Levin (1979) found that 5-year-olds' recall of auditory content was better if they were looking at the television at the time the auditory content was presented. Field and Anderson (1985) found the same linkage between looking and listening in 5-year-olds, but found that the linkage was reduced in older children. That is, older television viewers appear to be more capable of listening while they are visually attending to something else. This multitasking behavior, of course, becomes the initial basis for the increasingly common use of multiple media at the same time, especially by teenagers.

Visual Attention

Television viewers (young and old) do not just stare at the TV screen. Rather, they look at and away from the screen many times during the course of a viewing session. The sporadic nature of looking at television can be observed even when the viewer is not engaged in a concurrent activity. An important aspect of modern production of educational television for children, therefore, is an appreciation of this fact. Consequently, production strategies are used to attract the viewer's attention at critical times necessary for comprehension of the key messages.

Of particular importance in getting and holding the attention of young children, is that the program must be comprehensible. That is, the dialogue and narration should use age-appropriate vocabulary, the plot structure should not be complex, the setting interpretable within the experience of a young child, and the editing should demand as little inference as possible. When full attention is critical for comprehension, sound effects or other formal features should be judiciously employed to elicit attention from those members of the audience who are inattentive. It is also important to design the program so that children readily recognize that the program is intended for them. This can be done by using common features that are characteristic of children's programs including "enhanced reality" (bright colors in set design), and the use of animation, puppets, child characters, and the like. Features such as these have been repeatedly found to be associated with enhanced attention in child viewers (Alwitt et al., 1980).

Other factors such as humorous content can increase attention and information acquisition. Zillmann and colleagues (Zillmann, Williams, Bryant, Boynton, & Wolf, 1980) found that unrelated humorous inserts increased 5- and 6-year-olds' looking to the television and memory of educational messages; although it should be noted that the best practice is to try to integrate the humor with the educational content (Fisch, 2000). In general, of course, storylines and content that preschool children find engaging are essential for sustaining attention and interest (for example, saving baby animals forms the core basis of the plotlines for the highly popular *Go, Diego, Go!*).

Comprehension

After they reach the age of 2 years, children become capable of learning from TV. Improvements in children's language and narrative skills make television content more comprehensible, thus improving understanding of plotlines (Linebarger & Piotrowski, 2009). Children begin to comprehend that television is an iconic and symbolic medium; that it represents characters, objects, and events that are not present in the real world but also that it *can* represent real people, objects, and events. They begin to make distinctions between what is real and not real on television, recognizing for example that animation is not real (Dorr, 1983). That said, preschool children love to act "as if" they are participants in a TV program, particularly when the program invites their participation. Invited audience participation was part of the success of the highly popular *Blue's Clues* (Anderson, 2004). It has now become a common device used in many preschool programs.

Television viewing requires an implicit understanding of the meaning of production techniques used to show changes in scene, character perspective, and time. For example, when depicting an important meeting in the Oval Office, program producers might show an establishment shot of the exterior of the White House to allude to the location of this interaction. Generally, these types of editing and film techniques are known as cinematic montage (Monaco, 1981). By age 4, children begin to

understand elements of montage. Four-year-olds can interpret simple transition sequences, point-of-view camera shots, and actions that are not explicitly shown but implied to the audience (e.g., the viewer may infer that a cartoon character got a spanking from a parent if he was yelled at in a previous shot and in the next, the character is shown rubbing his backside). Though preschool children show some comprehension of the basic elements of montage, understanding has been found to further improve in 7-year-old children and beyond (Smith, Anderson, & Fischer, 1985). These advancements can be attributed to children's growing base of life experiences (including TV viewing), increasing ability to appreciate transformations in time and space, and increasing awareness of their own and others' thoughts and unique perspectives (for example, correctly interpreting a point-of-view shot).

Towards the end of the preschool years, programming format and familiarity can increase children's comprehension. By this age, children are able to understand plots that follow a linear progression with no subplots and character activity involving concrete actions (Pingree et al., 1984). Children also begin to develop their own preferences for programs, becoming regular viewers of particular series. This familiarity with particular programs has been found to improve comprehension (Crawley et al., 2002).

Educational Programming

One of the cornerstones of an effective educational program is a thoughtfully designed curriculum. *Sesame Street*, more than any other program, is the pioneer in preschool educational programming. As part of its original creation, and as part of its continuing production, program producers, child development specialists, educators, and researchers engage in collaboration (Lesser, 1977). Educators and child development experts design the underlying curriculum (which varies somewhat from year to year), writers create content that incorporates the curriculum, and researchers test versions of that content to determine appeal, comprehensibility, and learning. Based on "formative" research with children, the content may be revised or abandoned if any aspect of appeal, comprehensibility, or learning is lacking (Fisch & Truglio, 2001). If an educational program was developed with federal funding, "summative" research may also be done. Summative research is conducted on completed episodes or even on an entire season or two of the program. It is usually done with a large sample of children and involves a formal research design and data analysis. Continued federal funding of the program may well depend on the findings from the summative research.

Unfortunately, most formative research and some summative research (especially if it is done by a commercial network) are proprietary, and unavailable for review. In addition, many summative research studies are not published in archival form and may be difficult to obtain. However, through a combination of evaluations shared

by producers and additional empirical work of academic researchers, it is possible to examine the effectiveness of various types of programming. Below is a short review of preschoolers' cognitive and social learning from educational television (for a more extensive review, see Fisch, 2004).

Learning from Educational Programming

Because it was the first widely viewed educational TV program, and because of its longevity (first broadcast in 1969), *Sesame Street* provides the most information about the effects of educational television viewing. The evidence shows positive effects from studies of exposure to single episodes to studies of sustained, repeated viewing of the series (Fisch, 2004).

Short-term research is usually concerned with whether children actually comprehend and learn the content in particular episodes. In one experimental study, for example, Hodapp (1977) showed that a single exposure to a *Sesame Street* segment resulted in preschoolers' increased ability to apply the same problem-solving strategy seen in the segment. However, these same children did not apply the strategy to a similar task in a different context. Single, brief exposures can promote the literal use of information, but application of the knowledge across contexts may be limited.

Repeated viewings improve children's ability to recall story plots, crucial details, and extract abstract problem-solving skills. For example, in a study of *Blue's Clues* by Crawley and colleagues (Crawley, Anderson, Wilder, Williams, & Santomero, 1999), children who saw an episode five times not only remembered more of the educational content than children who saw the episode once, but they also showed substantially more transfer of problem-solving concepts to new contexts. It is worth noting that attention to the episode of *Blue's Clues* did not substantially diminish over five viewings, and in addition, audience participation (pointing at the screen, yelling answers to questions, etc.) increased with repetition.

Following the first season of *Sesame Street*, an evaluation assessed the impact of viewing on the school-readiness skills of preschoolers. Results showed that, over the 26-month period of assessment, children who viewed *Sesame Street* most frequently showed the greatest gains in sorting skills, knowledge of numbers and letters, and other cognitive skills (Ball & Bogatz, 1970). Follow-up studies concluded that frequent viewers were later rated by their teachers as better prepared for school than the less-frequent viewers in the sample (Bogatz & Ball, 1972). It should be pointed out that these early summative evaluations were not true experiments insofar as children were not randomly assigned to watch *Sesame Street* or to be non-viewers. Consequently, it is possible that children who were more drawn to watch *Sesame Street* were different from those who were less attracted to the show. Such studies are always open to the criticism that the evidence in favor of the show is not conclusive (e.g., Cook et al., 1975).

Subsequent studies indicated that viewing predicted increased vocabulary (Rice, Huston, Truglio, & Wright, 1990), improved school readiness (Zill, 2001), and better performance on math and scholastic achievement tests (Fisch, Truglio, & Cole, 1999). One study investigated long-term impact beyond the preschool years. Anderson and colleagues (Anderson, Huston, Schmitt, Linebarger, & Wright, 2001) recontacted 570 high school students who had been previously studied as preschoolers. In the original studies, detailed viewing diaries kept by parents indicated what programs the children watched. In the later “recontact” study, the by-then high school students were interviewed and their high school transcripts were obtained. Preschool viewing of educational television, particularly *Sesame Street*, was associated with higher grades in English, science, and mathematics. Educational viewing was also associated with greater leisure-time reading of books. In addition, *Sesame Street* viewers, when in high school, placed higher value on their academic performance, and tended to have higher levels of academic self-esteem. To summarize, *Sesame Street*, the longest-running and most-studied educational television program, provides both short- and long-term evidence that its viewers learn from the program and that this learning better prepares them for school. In turn, this preschool preparation is associated with positive consequences traceable at least through high school.

Inspired by the success of *Sesame Street*, (as well as audience ratings and sale of licensed products), Nickelodeon set out to design a new educational program to compete with those found on public television. *Blue’s Clues* was designed to teach cognitive and social problem-solving skills to preschoolers. The program design was based on research findings from studies done since *Sesame Street* was first broadcast. Whereas *Sesame Street* was designed on the assumption that children’s attention had to be maintained by frequent changes in image and content (Lesser, 1972), the design of *Blue’s Clues* was based on the presumption that children are cognitively active and engaged in thinking about the content and story line. It was also based on the idea that editing transitions provide a cognitive burden to young viewers. Finally, it made the presumption that given the opportunity, young viewers would be behaviorally and verbally interactive with the show if they were given the invitation to do so (Anderson, 2004). Following these ideas, the show provided a continuous storyline punctuated by solving problems posed by characters encountered during the search for “clues” to solve the main problem. The entire episode is produced with only three or four transitions that require viewer inference, and even these are clearly marked for the audience. Embedded within the format of the show is an interactive exchange between the host and the viewer, as he asks questions like, “What do we do when we find a clue?” (audience response: “Put it in our handy-dandy notebook”). Through pointing, making gestures, and calling out answers, the audience is encouraged to actively participate in the problem-solving activities.

In a study spanning two years of children’s exposure to *Blue’s Clues*, regular viewers performed better than non-viewers on problem-solving tasks seen on the show as

well as solving riddles that were not presented on the show (Bryant et al., 1999; Crawley et al., 2002). Other series such as *Allegra's Window* and *Gullah Gullah Island* have also been found to promote some types of problem solving (Fisch, 2004).

Children who do not develop basic literacy skills such as letter recognition by the time they enter school are three to four times more likely to drop out of school in subsequent years (Kirsch, Jungeblut, Jenkins, & Kolstad, 2002). Therefore, literacy has been a target content area for preschool educational television programs. One such program is *Super Why!* a series targeted at children ages 3 to 6 that promotes skills such as alphabet and word knowledge, comprehension, spelling, and an understanding of basic story structure. Linebarger, McMenamin, and Wainright (2008) randomly assigned children to watch either *Super Why!* or a control educational program (that did not teach literacy skills) over the course of eight weeks. After a mid- and final assessment, results indicated that children who watched *Super Why!* exhibited significant growth on targeted early literacy skills such as letter knowledge, phonological and phonemic awareness, and language development.

Educational television can influence a variety of skills and knowledge areas. For example, programs such as *The Electric Company*, *Barney & Friends*, *Dora the Explorer*, and *The Puzzle Place* have been found to play positive roles in language and second-language development (Fisch, 2004). Other types of positive influences on cognitive growth include appreciation for music and the arts, general knowledge, and appreciation of diversity, among others.

An aspect of school readiness is to prepare children with social skills such as taking turns, sharing, and the like. Preschool children must also learn to recognize and evaluate their own and others' emotional states in order to effectively apply social skills. Additionally, children must learn self-control in the face of strong emotions. Such social and emotional learning is the curriculum target of many educational TV programs directed at preschool children. In a meta-analysis of 34 studies examining the prosocial effects of television, Mares and Woodard (2005) found that children in both experimental and home observation studies who viewed prosocial programming behaved in a more prosocial manner and held more positive attitudes towards measures such as altruism and social interactions as compared to other children (see Chapter 30). The results of these analyses also suggest that prosocial television has as much influence on positive social behavior as aggressive or violent programming has for negative behaviors.

The primary goal of *Mister Rogers Neighborhood* was to contribute to the development of preschoolers' social and emotional life skills. After watching the series over a four-week period as compared to aggressive or neutral programming, preschool children who viewed *Mister Rogers* showed higher levels of self-control and persistence in a school setting as compared to children who viewed aggressive cartoons or nature programming (Friedrich & Stein, 1973). Furthermore, low-income children in particular showed improvements in verbalization of their feelings, cooperation with others, and nurturance.

Sesame Street has a broad school-readiness curriculum that includes prosocial and emotional skills as well as verbal and numerical literacy. Research indicates that *Sesame Street* contributes to the development of prosocial behaviors such as cooperation, sharing, and reductions in aggressive behavior (Bankart & Anderson, 1979).

Another program produced by Sesame Workshop, *Dragon Tales*, was created with the primary goal to foster preschool children's social and emotional skills. After multiple exposures, viewers of *Dragon Tales* showed a positive change in goal orientation and social relationships (Rust, 2001). Ratings from parents and teachers in this study showed that viewers of *Dragon Tales* scored higher on their tendencies to "choose challenging tasks," "start or organize play with others," "share with other children," and "cooperate with others."

Beyond the Preschool Years

Children's understanding of television programs continues to increase, reaching essentially adult levels by about age 12 (e.g., Collins, 1983). In the school-age years, as self-concept develops, and as they become more cognitively sophisticated, children's TV program preferences change a great deal. For example, whereas preschoolers do not care a great deal whether a character is male or female, character gender becomes important for children older than five. Boys begin to strongly prefer male characters and girls prefer female characters (Luecke-Aleksa, Anderson, Collins, & Schmitt, 1995). Reflecting cognitive development, school-age children begin to watch programs intended for adults and general audiences, whereas preschool children overwhelmingly watch children's programs. In fact, school-age children will often actively reject programs they previously watched as being "for babies" and begin substantial explorations of programs that are not educational in nature or intent. It has also been suggested that older children begin to prefer programs of higher complexity, specifically, those that possess a narrative structure and that focus more so on character interactions (Calvert & Kotler, 2003). In addition to shifts in these preferences, the authors found the overall interest in "educational" programs declines for these older children. These developments in program preferences make the creation of educational television programs for children beyond preschool a challenge.

An example of an educational program beyond preschool is *Between the Lions*, a PBS program designed for young school-age children to promote literacy strategies and enjoyment from reading. Research surrounding this program suggests that kindergarten viewers of this series showed higher levels of word recognition and standardized test measures as compared to non-viewers (Linebarger, Kosanic, Greenwood, & Doku, 2004). This same study found that at-risk viewers had significantly greater gains than not-at-risk youth. This suggests that educational programs may have differing impact depending on parent education, socioeconomic status, and access to resources.

The Electric Company, which targeted the improvement of literacy skills in lagging readers in the second grade, was found to improve reading skills across 19 different goal areas, with the greatest gains for first and second graders (Ball & Bogatz, 1973). Other series like *Arthur*, *Ghostwriter*, and *Reading Rainbow* have been found to establish an increase in school-age children's interest in reading and writing (Fisch, 2004).

Math and science programs have also received positive evaluations. *Square One TV* and *Cyberchase* enhanced positive attitudes toward mathematical learning (Fisch, 2004) and increased recall, comprehension, and children's use of problem-solving strategies (Hall, Esty, & Fisch, 1990). Among the benefits of science-based programs such as *3-2-1 Contact* and *Bill Nye the Science Guy* are a better understanding of basic scientific knowledge and interest in scientific exploration (Cambre & Fernie, 1985; Rockman et al., 1996).

Finally, as children grow older, an understanding of civics, social studies, and current events becomes increasingly important for scholastic achievement and social competence. Child-friendly programs that have offered age-appropriate coverage of current events topics include *Channel One* and *Nick News*. These types of programs can present important knowledge to children in age-appropriate language and content.

Those children who watch educational programs clearly benefit. What is not so clear, however, is whether these programs can successfully compete with their entertainment counterparts for an audience. While preschool educational programs like *Blue's Clues* have been successful in terms of audience ratings, this is much less true for educational programs directed at school-age children. The challenge for the future is to get more school-age children watching educational programs.

How is Educational Television Successful?

The first step in successful educational television production is getting children to choose and pay attention to the program. Fortunately, we know a considerable amount about attention to television. Many programs, such as *Sesame Street* and *Blue's Clues*, have made use of this knowledge (Anderson, 2004). The second step is to ensure that the production is comprehensible and does not distract from the core educational content of the program. In this regard, productions benefit enormously from formative research done with storybooks based on scripts, storyboards, and animatics (usually black and white drawings and partial animation with audio from voice actors and stand-ins). Such formative research ensures that children can comprehend and remember the content. Systematic formative research was an aspect of *Sesame Street's* innovation (Lesser, 1974) and is currently employed in many successful educational children's programs.

The third step is transfer. Transfer occurs when information obtained in one context can be successfully applied in other contexts. Successful transfer has been

found for programs such as *Sesame Street* that concentrate on cognitive skills (e.g., Ball & Bogatz, 1970), *Square One TV* (Hall et al., 1990), and *Blue's Clues* (Crawley et al., 1999), among others, in teaching school-readiness skills such as literacy, numeracy, and a variety of problem-solving skills for preschool and school-age children (Fisch, Kirkorian, & Anderson, 2005).

So how can transfer be encouraged? One theory, Fisch's capacity model (2000), attempts to combine literature-spanning information processing, cognitive schemas, and other mechanisms to account for transfer of learning from television. The model asserts that transfer relies on an initial comprehension of the educational content, the creation of a mental representation that is significantly more abstract than the initial learned content, and its relationship to the novel problem to which it will be applied. Breakdowns at any level of this process can result in a failure of transfer. An example of a way to increase transfer is to show the concept in operation in multiple contexts; this helps the viewers develop an abstract idea of the concept that is not tied to a specific concrete context (Fisch et al., 2005).

Final Comment

Television is but one platform for educational screen media. It is undoubtedly the most important medium for informal learning by preschool children, but it becomes supplemented and to some extent supplanted by other media as children get older. For this reason, an important feature in educational television program design is to include, as part of the overall plan, interactive media such as Internet resources and activities, DVDs and computer games, as well as books, magazines, and board games. If children become engaged with TV characters, they want to see those characters on websites, in books, in computer games, and elsewhere. When they learn ideas, skills, and concepts, they like to encounter them elsewhere. Consequently, any educational production focused on television must ultimately become a project incorporating many media.

There has been little research, however, on the effectiveness of multiplatform educational programming. A recent exception is a summative research report on the mathematics program *Cyberchase* by Fisch and colleagues (Fisch, Lesh, Motoki, Crespo, & Melfi, 2010). They found that, compared to children who only watched the TV show, children who also used the program's website and interactive DVDs showed better transfer of skills to new problems. This finding is consistent with transfer of learning theory and is probably due to increased exposure to problems in more varied contexts, and also to practicing of skills learned while watching the TV program. Video exposure alone, of course, does not readily encourage children to engage in practicing newly learned skills, whereas well-designed interactive media do. The success of informal educational media in general is likely to be enhanced by the use of multiplatform designs.

Prosocial TV Content

Children's Interpretations and Responses

Marie-Louise Mares

ABSTRACT

Two meta-analyses of the early research on prosocial effects of TV viewing suggest the possibility for positive effects, but also reveal a lack of systematic research into how best to achieve desired outcomes. Since then, the question has gained more social relevance because of a renewed international interest in using television to reduce prejudice and foster prosocial interactions, and because of the proliferation of programs in the United States that purport to teach socioemotional lessons. Research by Narvaez and others on comprehension of written texts suggests that there are important cognitive and moral schema developments that affect how children process moral messages. It is a central argument of the chapter that the same issues of interpretation and misinterpretation arise with prosocial television content. The latter part of the chapter focuses on the challenges of using TV as a tool for promoting inclusive attitudes, and a series of recommendations about how to increase the probability of positive outcomes.

Television as a Prosocial Force

Can television content be used to foster prosocial attitudes and behaviors among young viewers? The answer suggested by forty years of research is “yes” – but it

The International Encyclopedia of Media Studies, First Edition.

often seems to take more than unaided viewing and it can be challenging given the complexity of real world conditions. The central conclusion of this chapter is that prosocial TV content appears to have the greatest chance of success when viewed with an adult who encourages related discussion or activities. Even content produced with the best of intentions often has relatively small effects or no observable effects at all when children simply watch on their own at home.

There are several possible explanations. One has to do with media diets – those who watch prosocial television may often watch lots of other, less positive content as well (Rosenkoetter, Huston, & Wright, 1990; Wiegman, Kuttschreuter, & Baarda, 1992). An additional explanation, the main one I explore here, is that young viewers interpret prosocial media content quite differently than the adults who produce it for them. Given that the narrative structures of prosocial programs are often quite complex, young viewers may need help understanding the intended lessons and elaborating on them in ways that would lead to positive changes in attitudes and/or behaviors.

It is useful to begin by specifying what types of research are being considered here. My primary interest relates to the use of real television content to help children be inclusive, friendly, and cooperative in their social interactions. Part of that effort involves trying to mitigate the effects of negative or restrictive stereotypes. This chapter does not focus on the early experimental studies of the 1970s in which researchers generated their own content to examine the effects of modeling on altruism (e.g., generosity, helping, cooperation) and self-control (e.g., avoiding temptations to lie, cheat, or steal), though these are reviewed elsewhere (e.g., Mares, Palmer, & Sullivan, 2008; Mares & Woodard, 2001) and have been included in two meta-analyses of prosocial media effects (Hearold 1986; Mares & Woodard, 2005).

Following an initial swell of research in the 1970s, the question of how to promote friendliness, cooperation, and similar qualities via media content received relatively little attention for several decades. The issue became more salient again in the United States with the Federal Communication Commission's 1996 guideline that broadcast stations must offer at least three hours a week of educational/informative (E/I) children's programming in order to receive expedited license renewal. Content analyses of E/I programming (aired in Philadelphia in 1989–2000), found that the majority of the networks' educational offerings focused on socioemotional rather than traditional curricular lessons, such as the importance of getting along with others, being honest, overcoming prejudice, or feeling good about oneself (Jordan, 2004; Jordan, Schmitt, & Woodard, 2001). Given the mandate to produce programming with positive educational or socioemotional outcomes, the question arose again about how to achieve such goals.

But, it is worth noting *why* the topic languished for so long. Liebert and Sprafkin, two prominent researchers in the area of prosocial effects during the 1970s, wrote a textbook a decade later (Liebert & Sprafkin, 1988) in which they reflected on the concern that began to escalate about prosocial media content as a form of brainwashing and manipulation. As they describe it, a national ad campaign to promote friendly interactions between children was met with increasing alarm as critics pointed out

that cooperation and other forms of prosocial behavior need not be considered good qualities – rather, children may need to be tough and competitive in order to succeed (Karp, 1984; Rivers, 1974).

Brown and Singhal (1990) raised a series of similar ethical issues about the increased international use of entertainment programming to promote a variety of social goals such as overcoming alcoholism, adoption of modern agricultural practices, and sexual responsibility. They noted the dilemmas about who should get to decide which values should be promoted as well as the potential (present in any content) for unintended negative consequences. Their ultimate conclusion was that viewers should be informed about the intended persuasive effects of prosocial content so that they can decide whether to watch, or allow their children to watch.

In the United States, the current practice is for most educational/prosocial programs for children to be accompanied by a website that explains the goals of the program and provides descriptions of sample episodes. This, of course, does not mean that parents know about this material or bother to read it. In international efforts, particularly those that are coproductions with Western media corporations, there remain the lurking issues of cultural imperialism and the imposition of Western values in places where they are inappropriate or unwelcome. The response of one major institution that has been at the forefront of international educational efforts, *Sesame Street*, has been to emphasize the cooperative aspects of coproduction. That is, programming goals and strategies are developed in close collaboration with educators, policymakers, and producers in the specific region.

Overall, then, prosocial interventions should involve working closely with others in cross-cultural contexts to avoid an imposition of values. Further, the ideal scenario would be that prosocial television programs would be attractive enough to make children watch voluntarily, and effective enough to produce positive outcomes from watching at home under normal conditions. However, much of the research suggests that children often need more assistance.

Weak Effects of Unaided Viewing at Home

In an early study, Friedrich and Stein (1973) studied the effects of *Mister Rogers' Neighborhood* – a live action program aired in the United States in which the main character, Mr. Rogers, consistently modeled friendly, supportive interactions. Short segments occasionally depicted social dilemmas faced by puppet friends, and these were resolved in prosocial ways. Friedrich and Stein began their field experiment with 97 three- to five-year-olds by examining the initial relationships between self-selected home viewing of *Mister Rogers'* and children's classroom behaviors (e.g., cooperation and empathy) during the baseline three-week period. None of the measures were significantly related to home viewing, either in the group as a whole or among specific subgroups of children.

Similar lack of effects were reported by Sprafkin and Rubinstein (1979) in their study of the home viewing choices and classroom behaviors of 500 middle-class seven- to nine-year-olds in the United States, and by Wiegman et al. (1992) in their three-year longitudinal study of 466 seven-year-olds and nine-year-olds from large urban districts in the Netherlands. At all three times of measurement, Wiegman et al. found only trivial, nonsignificant correlations between home viewing of prosocial content and roster-ratings of prosocial classroom behavior. They noted that children who watched a lot of prosocial programming tended to be heavy viewers who also watched a lot of antisocial content.

Studies that have examined the relationship between self-selected exposure to entertainment programming featuring non-traditional or counter-stereotypical portrayals also report weak effects. Rosenwasser, Lingenfelter, and Harrington (1989) looked for correlations between children's knowledge of three US programs featuring relatively non-traditional gender roles (*The Cosby Show*, *Growing Pains*, and *Who's the Boss?*) and non-traditional gender role beliefs. Only 4 out of 25 correlations were significant – barely above chance. Mares and Acosta (2010) studied a US sample of 128 four- to six-year-olds, and found no significant relationships between children's self-reported frequency of viewing 20 programs that purportedly taught inclusiveness and positive interactions, and children's interest in having classmates of different race/ethnicity or gender.

Rosenkoetter (1999) asked two samples of US 6- and 8-year-olds how often they watched 30 adult situation comedies (rated for level of prosocial content), and asked the mothers how often their child engaged in positive behaviors such as sharing and helping others. In one study, Rosenkoetter found a fairly strong positive correlation ($r = .57$) between prosocial situation comedy viewing and prosocial behavior, but only among the 6-year-olds (not the 8-year-olds) and without any controls for background variables except gender. In another study reported in the same paper, Rosenkoetter found a small, marginally significant correlation between viewing adult prosocial situation comedies and mothers' reports, but only among children who were able to identify the moral lesson in a sample episode of *Full House*. There was no relationship between prosocial viewing and behavior among the children who did not perform well on this task, consistent with the argument that comprehension (or the lack of it) is a mediator of the effects of home viewing.

Why Might Young Viewers Need Help Interpreting Prosocial Content?

One answer is that young viewers often need help interpreting any narrative (not just prosocial ones) because of developmental cognitive constraints. As outlined in Fisch's (2000) cognitive capacity model, young viewers have a smaller working memory and less background knowledge to use in understanding a televised story.

Thus, more complex narratives tax the limited resources available and increase the odds that viewers will miss or misunderstand much of the content.

Research suggests that young children (up to age eight) remember less content from a television program than older children or adults (Van den Broek, Lorch, & Thurlow, 1996). When they do remember events, they often have difficulty understanding how they are connected – how one event caused another, which in turn led to a later outcome (Collins, Wellman, Keniston, & Westby, 1978). Moreover, the types of information that seem very relevant to prosocial outcomes may be the most likely to be forgotten – how a character feels (Hayes & Casey, 1992; Knowles & Nixon, 1990; Thompson & Myers, 1985), what their motives are (Van den Broek, 1989) or what the consequences are for being nice or nasty (Collins, Berndt, & Hess, 1974). Not surprisingly, given their lesser attention to emotions, young children are less likely (though not unable) to be upset by a character's display of fear or misery (Wilson & Cantor, 1985).

A second point, as Fisch (2000) noted (and as Anderson and colleagues discuss at more length in Chapter 29, this volume), is the addition of educational material to narratives, which tends to increase the cognitive load for young viewers. The greater the load, the more likely it is that some content will simply not be noticed or that other content will be misunderstood or forgotten.

Third, research suggests that information about social groups is filtered through preexisting schemas, such that schema-consistent information is remembered best, and schema-inconsistent information is often forgotten or distorted (see Chapter 13, this volume). For example, Bigler and Liben (1993) had children listen to stories in which African-American and European-American characters interacted. In one condition, the African-American character was lazy (or mean, or dirty); in the counter-stereotypical condition, the African-American character was presented positively and the European-American character held the negative attributes. Children who were more cognitively mature and could classify stimuli along multiple dimensions were better able to remember the counter-stereotypical story. Less advanced children and those who initially held the most negative racial stereotypes often misremembered the counter-stereotypical stories. In their "version" the attributes were reversed to conform to their initial perceptions that the African-American character would have the negative attributes. Other studies have demonstrated the same reversals in memory for counter-stereotypical gender portrayals (e.g., Cordua, McGraw, & Drabman, 1979; Liben & Signorella, 1993).

Finally, young viewers may need help with prosocial content because of the specific developmental challenges of extracting moral lessons from narratives, particularly given the common structures of televised prosocial narratives in the United States.

"The Moral" as Especially Misunderstood Content

Narvaez (1998) has argued that children tend not to interpret moral lessons in stories in the same way as adults, because the act of extracting an overarching theme about

a moral principle is shaped not only by cognitive development but also by moral development. In one study, Narvaez, Gleason, Mitchell, and Bentley (1999) had 8-year-olds, 10-year-olds, and undergraduates read stories in which the main character faced a moral dilemma (e.g., whether to return extra change), and then choose which of four short messages and four short vignettes best captured the moral theme of the story. The 8-year-olds chose the correct vignette 11% of the time (below chance), and the 10-year-olds made the correct choice 45% of the time, compared to 91% for the undergraduates. Similar developmental patterns were also observed in another study (Narvaez, Bentley, Gleason, & Samuels, 1998), in which children with less developed moral schemas tended not to recall story content related to more advanced moral reasoning – in effect, age groups varied in the lessons they were extracting.

Not surprisingly, research indicates that it is harder for children to extract a “grown-up” version of the moral message if the story is a fable or is otherwise unrealistic (Goldman, Reyes, & Varnhagen, 1984). Jose, D’Anna, and Krieg (2005) reported that kindergarten and second grade children often misunderstood simple metaphors (e.g., a person can be emotionally “cold”) and proverbs (e.g., “all that shines is not gold”), and that comprehension of these forms was associated with greater ability to extract the moral of a fable. The more realistic the story (Lehr, 1988) or the closer an analogy to a real-world task (Gentner & Toupin, 1986) the better young children perform in recognizing the theme or applying the information to their own situation.

Identifying the Prosocial Lesson of Television or Film Narratives

How well do children do at identifying the intended lesson of audiovisual narratives? Rosenkoetter (1999) had 81 first, third, and fifth graders watch an episode of *The Cosby Show*, a US live-action situation comedy featuring the comedian Bill Cosby and his television family. Rosenkoetter identified six different moral issues in the episode he showed students (e.g., it is wrong to steal, wrong to lie, good to forgive). Virtually all students in each grade correctly identified at least one lesson, but it took rather more probing (up to five questions per lesson) to elicit the others. In another study in the same paper, he showed 73 first and third graders an episode of a different situation comedy, *Full House*, in which the main character had to decide whether to throw easy pitches to her boyfriend on an opposing baseball team and thereby make her team lose. When asked, approximately 80% of children said that they thought there was a moral lesson in the episode but only 32% of first graders and 46% of third graders correctly articulated what it was.

Along similar lines, Mares (2006) showed 72 six- to nine-year-olds the Disney animated film, *The Sword in the Stone* and asked them whether they thought there was a lesson in the film. As in Rosenkoetter’s (1999) study, most children (79%) said that they thought there was indeed a lesson. Of these, 14% said they could not say what

it was, 32% repeated some part of the story (e.g., “There was this sword in this stone, and this boy, he pulled it out”), and 53% gave a general moral principle that was not related specifically to the story (“You have to be nice to people.”). Only one child gave something approximating the lesson as identified by a separate group of 30 adults (about the importance of intellect and education over physical strength). He had seen the film multiple times.

Children’s difficulty in extracting the moral lesson from *The Sword in the Stone* (even when viewers had seen the film before) is not surprising given the complexity of the task involved, hence the cognitive resources required. The lesson had to be extracted from snippets of song and fragments of dialogue (“Use your head, boy!”) and there were no visual primes of the intended lesson. Arthur was shown flying through the air or swimming like a fish to escape various predators; although Merlin had lots of books, he and Arthur seldom consulted them. Thus it is unsurprising that children were unable to articulate the relatively unfamiliar lesson, and it is unlikely that watching the film would have prompted children to pause and engage in thoughtful (rather than physical) responses to social dilemmas.

How are Prosocial Lessons Taught in Television Content?

How do television producers go about trying to encourage and teach children to be friendly, cooperative, and inclusive? Smith et al. (2006) examined the frequency and context of altruistic acts on US television in 2005. They noted that there were approximately four instances of helping or sharing per hour in children’s cable programming and close to three per hour in public broadcasting programming (of which a high proportion is children’s content). Roughly half of all altruistic acts in children’s cable or public broadcast programs were initiated and received by human characters – the rest were performed or received by animals or other anthropomorphic characters. Half or slightly less than half were in realistic contexts, and a number involved humor (21% in public broadcasting, 43% in children’s cable).

We noticed similar patterns in our much smaller examination of television stations’ descriptions to the FCC of their educational programming (Mares & Acosta, 2008). We found 12 children’s programs that were purportedly teaching inclusiveness or tolerance of social differences. Most of them were targeted to children aged 8 and younger, and most were at least partly animated (10 out of 12, 83%) and contained anthropomorphic major characters such as cats, dogs, or dragons (11 out of 12, 92%). Moreover, examination of episode descriptions on *TV.com* suggested that tolerance was often taught by depicting one nonhuman character (e.g., a caterpillar) initially expressing prejudice or hostility toward another nonhuman character (e.g., a spider) and then learning, over the course of the episode, to be more inclusive.

Consider, for example, the following storylines. In an episode of *Rolie Polie Olie*, the main character (who lives on a planet where everything is round) is disturbed by the idea of playing with someone with a square head. In an episode of *The Berenstain Bears*, Papa Bear is bothered by the fact that a different species of bear has moved in next door. In *Miss Spider's Neighborhood*, Miss Spider faces hostility from other bugs that do not like spiders. In an episode of *Sagwa, the Chinese Siamese Cat*, a dog is teased for wanting to play with cats and engage in cat-like activities. In each case, the story ends with the character learning the error of his or her ways – but the happy ending is often relatively brief compared to the long build-up of initial discomfort.

There are two key features of these scenarios. First, they are not realistic which, given the prior research on children's difficulty with fables suggests that they may be challenging for young viewers to decode. It seems unclear that a child would reflect that just as a dog can play with a cat, so too can a girl play with a boy or a Chinese child play with an African American child. Second, and probably more importantly, much of each story is focused on negative rather than positive emotions and behaviors.

The Risks in Modeling Negative Attitudes and Behaviors

A handful of studies point to the risks of trying to teach prosocial behaviors by depicting an initial conflict or antisocial behavior. In fact, the results of our meta-analysis suggested that the negative effects of such depictions on children's interactions tend to be even stronger than "unadulterated" antisocial content, perhaps because the context of a prosocial program suggests that the initially hostile behavior being modeled is appropriate.

In an early study, Silverman and Sprafkin (1980) had 3- to 7-year-olds watch a 16-minute *Sesame Street* segment featuring either friendly, conflict-free interactions, or conflicts that were resolved peacefully. Pairs of children then played a marble game designed to measure cooperation: they could maximize the number of marbles they both got by taking turns, or they could ruin each other's chances by working against each other. Silverman and Sprafkin found that the prosocial-only condition had virtually no effects on cooperation in the marble game relative to a control group. However, those who saw the conflict-plus-peaceful-resolution actually cooperated less than did the control group. Similarly Liss, Reinhardt, and Fredriksen (1983) showed children either a non-aggressive excerpt of a *Superfriends* cartoon, or one in which the superheroes used aggression to teach someone not to steal. Those who saw the aggressive (though ultimately prosocial) content were subsequently less cooperative than those who saw the non-aggressive content and in a subsequent interview, they showed less comprehension of the plot and moral lesson of the episode. Most recently, Truglio, Kotler, Cohen, and Housley-Juster (2005) reported

on the effects of an episode of *Sesame Street* in which Telly Monster fantasized about beating up another character who kept taking his triangles. Although the story ended positively, children who saw the episode gave more negative responses when asked what a child should do in a parallel situation than they had before they saw the episode. (See also Fisch, Brown, & Cohen, 2001.)

To be fair, there are instances where this storyline seems to work. In the same paper, Truglio et al. (2005) also reported on the effects of another episode in which Big Bird's pen pal, Gulliver, was briefly unwilling to play with anyone who was not a bird. After being confronted by Big Bird ("If you don't want to play with my friend, then I don't want to play with you!") he learned better. Children gave significantly more positive responses to a hypothetical exclusion scenario a week after watching the episode than they had before they saw it. Presumably the differences in outcomes of the two studies had to do with the visual salience of the initial negative behavior and the speediness of the prosocial resolution.

Children's Interpretations

To examine these issues further, we decided to examine children's interpretations of a similar story. We chose an episode of *Clifford the Big Red Dog*, an animated program in which Clifford and his fellow dog friends (Cleo and T-Bone) and his owner, Emily Elizabeth, face various social dilemmas together. In this particular 10-minute episode (*The New Friend*) the dogs met a new dog that only had three legs (KC). Although Clifford is extremely (indeed, overly) friendly and concerned to be helpful, Cleo is primarily scared. She has a short fantasy represented by "thought bubbles" that KC chases and contaminates her. She lags behind to avoid walking with KC and comments to T-bone that this was because she was afraid of catching leg-losing germs. She refuses to catch a ball that KC threw her. Overall, Cleo is fearful for 9 minutes and 38 seconds of the episode, and the positive resolution only occupies the last 1 minute and 15 seconds. Sixty-four kindergarteners (aged 5 and 6) were assigned to watch either this original version, or an edited version (of the same length) with the fear removed.

The children in our study found it difficult to identify the moral lesson even though they were at the upper end of the target age-range. In many instances, they took the story at face value, regarding it only as a tale about a three-legged dog. Moreover, the two groups of viewers differed in their inferences – those who saw the original version, compared to those who saw the fear-removed version, were more likely to say that the dogs might get sick if they played with KC, and they rated him less positively. Not surprisingly then, the more they remembered that KC wanted to be friends and the more they remembered Cleo's initial fear, the less likely they were to identify the protolerance message. However, for children who saw the fear-removed version, remembering more of the (happy) elements of the story was associated with greater probability of identifying the message about tolerance.

Although we did not measure children's interest in playing with a peer with disabilities, we could see that most children did not understand the episode in the manner intended by the producers, and their interpretations were largely inconsistent with prosocial outcomes. The question then arises how one might try to improve comprehension in order to increase the odds that there might be positive outcomes.

Strategies to Try to Increase Positive Effects

Given the argument that weak effects of prosocial content are at least partly a result of cognitive constraints on processing, the logical solution is to try to improve processing and comprehension of prosocial content by freeing up cognitive resources. The strategies outlined here all involve some variant of this approach. I present them in order of least intervention to most additional adult intervention and (not coincidentally) in order of less consistently successful to most successful in fostering prosocial outcomes of viewing.

Repeated Exposure to the Content

Given that children often watch the same material repeatedly (Mares, 1998), one possibility is that with repetition, they would come to understand the material better, including the intended prosocial lessons. The evidence for the benefits of repetition is mixed. Presumably, the effects depend on how much repetition there is, and how consistent the prosocial message.

Anderson and his colleagues conducted a series of studies in the United States of children's responses to *Blue's Clues* (Anderson, Bryant, Wilder, Santomero, & Williams, 2000; Crawley, Anderson, Wilder, Williams, & Santomero, 1999). *Blue's Clues* was designed to teach thinking skills to preschoolers by having an animated dog (Blue) interact with a human character (Steve) and the viewing audience to solve a series of puzzles. The program was remarkable for its consistently positive interactions between characters, Steve's use of direct questions to viewers ("Can you help Blue find the triangle?") and for the fact that each episode was broadcast five times in a row (once per day each week).

Crawley et al. (1999) found that 2- to 5-year-olds' comprehension of a specific episode increased substantially over the course of five days' repetition. Although this initial study did not examine comprehension of prosocial messages (and prosocial interactions were not explicitly taught), Anderson et al. (2000) also conducted a two-year longitudinal study of 120 2- to 5-year-olds in which one of the measures included caregivers' repeated assessments of the child's social behaviors (e.g., helping others). Initially none of the children in the study had access to the program; subsequently, children who had access and watched regularly were compared with those who did

not have access. The majority of changes over time occurred in cognitive domains, particularly those explicitly taught by the characters. However, the ongoing, repeated modeling of friendly, positive interactions also appeared to have small, positive effects on children's social interactions. By the end of the second year, caregiver ratings of prosocial behaviors were 9% higher for regular viewers of *Blue's Clues* than for non-viewers.

Other studies, with fewer repetitions and less accumulation of prosocial modeling, found weaker effects. Persson and Musher-Eizenman (2003) compared the effects of showing European-American preschoolers 10 minutes of prodiversity television programming that either featured animated humans, puppets that resembled humans, or live humans. None of the conditions reduced children's preferences for photographs of Caucasians rather than photographs of Blacks and Asians or their preferences for "White" Fisher-Price Little People dolls rather than Black and Asian Little People Dolls. In a second study reported in the same paper, children watched the same episode four times over 12 days. Although children who saw the episode repeatedly understood some of the basic elements of the plot slightly better, their preferences did not change.

In the study of *The Sword in the Stone* (Mares, 2006), I compared the comprehension levels of children who saw the film for the first time in the study, with those who had seen it multiple times before. Even those who had seen it several times before found it difficult to make inferences about connections between events that occurred at very different points in the film and (as noted earlier) only one child could articulate the moral lesson. Thus, repetition is helpful, but it may not ensure comprehension (let alone effects) of fairly complicated narratives.

Adding Explanatory Inserts to Prosocial Content

Given the above, another alternative would be to try to make narratives simpler, not by changing the story, but by adding elements that would help draw attention to the most important events and/or that would explain the thematic connections. Again, the idea is to reduce the cognitive load required to process the information, thereby improving comprehension and ultimately improving effects.

Prior studies have found mixed effects of inserting content within episodes to try to increase children's comprehension. One of the first such projects examined five- and nine-year-olds' comprehension of an episode of the prosocial cartoon, *Fat Albert*. The researchers (Watkins, Calvert, Huston-Stein, & Wright, 1980) compared the effects of inserting short pauses after the key events (presumably allowing children time to process the information more fully) versus inserting short audio inserts that explained the otherwise implicit connections of events to the overall prosocial theme. Neither strategy produced significantly more comprehension than an unmodified version of the episode. A second study did find positive effects of audio-only inserts

on comprehension of implicit content (Calvert, Huston, & Wright, 1987), but found that audiovisual previews of the plot only increased picture-sequencing scores (not comprehension of implicit content). A third study reported that sound effects directing children's attention to key points were associated with increased implicit comprehension, but visual inserts depicting whether the main character was dreaming or awake were associated with decreased implicit comprehension (Calvert & Gersh, 1987). Neuman, Burden, and Holden (1990) studied the effects of an audiovisual preview that summarized a televised story up to the climax and ended with a statement to help children predict how the story might end. The preview helped children remember the central events and resolution but did not help them with implicit content.

None of these studies examined the attitudinal or behavioral effects of explicitly previewing the moral lesson of a story or of inserting evaluative comments about characters' behaviors. Thus we decided to build on the prior research by examining whether audiovisual inserts that summarized the moral lesson and negatively evaluated the initial conflict could increase children's comprehension of the overarching protolerance message and thereby foster positive attitudes and judgments related to inclusiveness (Mares & Acosta, 2010).

A total of 128 4- to 6-year-olds were randomly assigned to watch one of two animated TV episodes (from *Arthur* or *Sagwa, the Chinese Siamese Cat*) depicting initial hostility followed by friendliness (either with or without inserts), or to watch a control episode unrelated to tolerance. One insert at the beginning of the episode explicitly stated the moral lesson and its connection to the viewer's life; the second insert commented negatively on the main character's initial hostility. The hypothesis was that these inserted segments would provide scaffolding for young viewers, allowing them to understand the story better than they would without help.

The episode of *Arthur* (featuring a very human-looking aardvark) focused on conflict between boys and girls at a sleepaway camp, which was ultimately resolved by working together to beat rivals from another camp. The episode of *Sagwa* focused on a Siamese cat who was ridiculed for her friendship with mice, and as a result, initially avoided the mice until she learned better. After watching one of these two episodes (either with or without the inserts) or the control episode, children were asked to indicate which of a variety of diverse hypothetical classmates they would like to have in class and to evaluate an exclusion scenario.

Children who saw the cat-mouse episode with inserts showed significantly more prosocial reasoning about gender-based exclusion than the control group; those who saw it without inserts did not differ from the control group. Those who saw the boy-girl episode without inserts showed significantly less prosocial reasoning than the control group and were significantly less likely to show gender balance in their choice of hypothetical classmates; those who saw it with the inserts did not differ significantly from the control group. Thus the inserts seemed to enhance the positive effects of the cat-mouse episode and mitigate the negative effects of the boy-girl episode on gender-related judgments. Moreover, our argument that children's inter-

pretations of the content play a key role in explaining the effects of exposure was supported by mediation analyses – controlling for children’s evaluations of the initial hostility in the episode and their understanding of the intended moral lesson provided partial mediation of the effects of viewing condition on their classmate choices and moral reasoning about exclusion.

Overall, the set of studies suggest that comprehension (or the lack thereof) is indeed part of the reason why prosocial episodes are sometimes ineffective when watched without additional help. However, inserts of sound effects or explanations do not consistently foster improved outcomes.

Couldn’t Parents Explain?

Research on “scaffolding” suggests that comments and questions by adults can help children master a task that is within their developmental range of competence but would be slightly too difficult without assistance (Wood, Bruner, & Ross, 1976; Wood & Middleton, 1975). One obvious possibility is that if parents want their young children to learn socioemotional lessons from television, they could coview, ask questions and, if needed, point out the moral lessons. Several studies (e.g., Clarke-Stewart & Beck, 1999; Collins, Sobol, & Westby, 1981) found that children were better able to remember the events of the story or make inferences connecting events, if they watched with an adult who made comments, asked questions, and corrected misinterpretations about the program. Similarly, Watkins et al. (1980) found that having an adult coview the episode of *Fat Albert*, pause it at key points and explain the importance of a particular event and how it related to earlier events (both temporally and thematically) created significantly higher comprehension. Remarkably, the points at which the adult paused the tape and the comments made were identical to those in the unsuccessful audiovisual inserts group described earlier.

Other research suggests that having adults make evaluative comments about television characters’ actions can help diminish negative effects (Nathanson, 2004; Nathanson, Wilson, & McGee, 2002) and enhance positive effects of viewing (Abelman, 1991). However, survey research (Rideout & Hamel, 2006) suggests that parents typically do not watch television with their children and instead report using the time when their children are watching to get other things done. Thus although this seems a potentially fruitful approach, it does not appear likely to happen with great regularity.

Activities that Elaborate on Prosocial TV Exposure

The final, most labor-intensive possibility is that prosocial television content can be accompanied by related activities and classroom discussion, elaborating on the prosocial themes. In general, the research suggests that positive effects are stronger under these conditions.

Readers will recall the Friedrich and Stein study (1973) of *Mister Rogers' Neighborhood* described earlier in which there were no significant effects of viewing the program at home. In contrast, there were significant changes in the subset of children who then watched 12 episodes of *Mister Rogers' Neighborhood* over four weeks in preschool, accompanied by related activities. They persisted longer at tasks, were more likely to obey rules, and were more likely to delay gratification without protest, than those who watched other programs. Moreover, among children from families with lower socioeconomic status, those assigned to watch *Mister Rogers' Neighborhood* showed more cooperation and friendliness in playground interactions, though these effects gradually declined throughout the two-week post-exposure period.

In a second study, Friedrich and Stein (1975) assigned 75 kindergarten children to either a control condition or to watch four episodes of *Mister Rogers' Neighborhood* and receive one of two types of training: verbal labeling (children were taught to describe how characters had felt and behaved) or role-playing (children used hand puppets to reenact scenes from the episodes). Over the next few days, the children had opportunities to engage in helping behaviors, either related to the program (helping a puppet from the program during a reenactment of one of the scenes) or in unrelated contexts (helping fix a torn collage). There were slightly higher levels of helping behaviors among the children who had watched *Mister Rogers* than among those in the control group. For boys, however, the effects varied by type of training. Role-play training strengthened the effects of the program, but verbal labeling was associated with some decreases in helping relative to the control group. Girls, by contrast, learned the content best in the verbal labeling condition.

In their third study, Friedrich-Cofer, Huston-Stein, Kipnis, Susman, and Clewett (1979) compared the effects of (1) 20 episodes of *Mister Rogers* over eight weeks without any additional prosocial materials; (2) 20 episodes of *Mister Rogers* and access to prosocial books and games; (3) 20 episodes of *Mister Rogers*, access to prosocial materials, and follow-up activities such as verbal labeling of emotions and role playing, and (4) neutral films. The researchers found that *Mister Rogers' Neighborhood* alone produced relatively few behavioral changes. Children in the second group (viewing plus materials) displayed more positive *and* more negative behaviors. Only children in the third group (viewing and materials and activities) displayed more positive behaviors without any increases in aggression.

A similar finding emerged from Johnston and Ettema's (1985) vast field experiment with 7,000 fourth- through sixth graders across the United States, examining the effects of *Freestyle* (a US public television program designed to reduce stereotypes about gender roles in school). When the 26 quarter-hour episodes were watched in class and followed by teacher-led discussions of the issues raised, the students showed substantial changes in their gender-related beliefs and most effects were significant even nine months later. However, when the programs were viewed in a classroom with no follow-up discussion, there were many fewer significant effects. Among those who only watched at home, the few significant effects were limited to the heaviest viewers.

Overall then, a number of studies established that it was possible to use television programming in school to produce positive and relatively enduring changes in children's behaviors. Moreover, the effects were strongest among children from low-SES backgrounds who initially behaved less positively in school interactions. However, these positive changes primarily occurred in the context of extra material and rehearsal of the program lessons.

Conclusions

Although I do not lightly brush aside the ethical concerns raised about manipulating children, I would argue that it is indeed a prosocial outcome to have children interacting in friendly, inclusive ways. The research reviewed here suggests that there can be significant and important positive changes in children's social attitudes and behaviors as a result of media exposure.

However, the findings also indicate that it is often unrealistic to expect television content to have such effects on its own, given the cognitive work involved in extracting moral themes from stories. Moreover, when the stories adults produce for children contain mixed messages (lingering on hostile or fearful interactions rather than focusing on positive emotions), the outcomes of viewing tend to be less than prosocial.

The implication, explored here, is that improving children's comprehension of the intended point of a prosocial narrative is one path to improving the outcomes of exposure. Unfortunately, the research does not suggest that there is a quick and easy path to improved comprehension, though increasing the focus on visually salient demonstrations of positive feelings and behaviors seems a good start. Active adult mediation of the content, whether at the time of viewing or via subsequent discussions, labeling, and related activities appears, thus far, to be the best route toward positive effects of viewing. Thus far, the research on substituting adult mediation with audiovisual inserts finds only mixed benefits.

Given the FCC mandate for educational/informative programming and the genuine desire of producers and educators and parents to have at least a portion of children's viewing be socially beneficial, it seems wasteful not to work further to refine our understanding of what is involved in promoting values that we agree, as a society, our children should learn.

The Effects of Internet Communication on Adolescents' Psychosocial Development

An Assessment of Risks and Opportunities

Jochen Peter and Patti M. Valkenburg

ABSTRACT

In this chapter, we discuss both the appeal and psychosocial consequences of different types of Internet communication, such as instant messaging and social network sites. We identify five characteristics of Internet communication that may explain both the attraction of Internet communication for adolescents, as well as its potential positive and negative consequences. Next, we review the research that has addressed some opportunities (i.e., friendship formation and quality) and risks (i.e., cyberbullying; relationships with online strangers) of the Internet for psychosocial development. We end by outlining shortcomings of existing research and make some suggestions for future research.¹

Adolescents and the Internet

In most rich Western countries, Internet communication has become an integral part of adolescents' lives. Adolescents are the defining users of Internet communication. They far outnumber adults in their use of Internet communication technologies,

such as instant messaging and social networking sites (e.g., Lenhart, Madden, Smith, & Macgill, 2007). For example, 53% of US and 91% of Dutch adolescent Internet users communicate online through instant messaging (Rideout, Foehr, & Roberts, 2010; Valkenburg & Peter, 2009a), and increasing numbers of adolescents have started to use social network sites (e.g., Facebook), blogs, and photo and video sharing sites (e.g., YouTube). Across thirteen European countries, 66% of all Internet users aged 15 or older visited social network sites in 2008 (comScore, 2009). Further, 28% of all adolescent Internet users in the United States reported blogging in 2007, as opposed to 8% of the adult Internet users (Lenhart et al., 2007). Finally, data from 2010 show that 74% of all US adolescents aged 13–18 have created a profile on a social network site (Rideout et al., 2010).

Adolescents' massive and rapidly changing use of communication technologies has elicited mixed reactions, both from academics and the public. On the one hand, concerns have been voiced that adolescents may become victims of abusive relationships, or develop shallow interpersonal relationships with strangers (for summaries of these concerns, see e.g., Donnerstein, 2009; Hinduja & Patchin, 2008). These concerns have been fueled by parents' inability to control their children's Internet use (Donnerstein, 2009). On the other hand, it has been argued that the Internet provides adolescents with enormous opportunities to explore their identity in a relatively safe space; develop close and meaningful relationships beyond the obstacles of face-to-face communication; and find information and social support regarding developmentally sensitive issues (e.g., McKenna & Bargh, 2000; Subrahmanyam & Greenfield, 2008; Turkle, 1995). Proponents of this position typically refer to adolescents' self-regulatory capacities and their Internet competence as a potential protection against adverse consequences (e.g., Sternheimer, 2003).

Adolescents' extensive use of the Internet and the uncertainty about its consequences call for an integrative perspective that helps us understand both the attraction of Internet communication and its risks and opportunities. The aim of this chapter is to hypothesize, and if possible, substantiate by evidence that both the appeal of Internet communication and its psychosocial consequences can be attributed to the enhanced controllability of self-presentation and self-disclosure in Internet communication. Self-presentation and self-disclosure are functional skills that have to be learned in adolescence, and are vital for two components of psychosocial development: identity and intimacy. We will discuss how five features of Internet communication influence self-presentation and self-disclosure skills, and thereby, identity and intimacy development. Subsequently, we review research on the opportunities and risks of Internet communication for adolescents' identity and intimacy development. Finally, we discuss some shortcomings of existing research and possibilities for future research. By Internet communication, we mean any social interaction on the Internet, but we focus on instant messaging and social network sites because they are most popular among adolescents. Texting through mobile phones, although also popular among adolescents, falls outside the scope of this chapter.

Internet Communication and Psychosocial Development in Adolescence

Developmental researchers agree that the overarching developmental goal in adolescence is that young people achieve psychosocial autonomy from their parents (e.g., Bukatko, 2008; Steinberg, 2008). Within this overarching goal, at least two developmental tasks are important for psychosocial development (Steinberg, 2008). First, adolescents have to develop a firm sense of *identity*, that is, they need to achieve a secure feeling about who they are and who they become (e.g., Erikson, 1968; Harter, 1999; Kegan, 1982; Loevinger, 1976). Second, they have to develop a sense of *intimacy*, that is, they need to acquire the abilities that are necessary to form, maintain, and terminate close, meaningful relationships with others (e.g., Buhrmester, 1990; Buhrmester & Furman, 1987; Buhrmester & Prager, 1995; Furman & Wehner, 1994).

Each of these two developmental tasks is accompanied by a specific skill that does not arise automatically, but that adolescents have to learn and practice. For the development of a firm sense of identity, they need to learn how to present themselves to others and how to adjust their self-presentation according to the reactions of others (e.g., Baumeister, 1982; Harter, 2003; Leary, 1996). Through self-presentation, adolescents not only communicate various identities to others, but they also learn to consolidate or modify these identities in line with the feedback they receive (Valkenburg et al., 2007). To develop a sense of intimacy and, more specifically, close relationships, they need to learn to disclose intimate information to others (e.g., Buhrmester, Furman, Wittenberg, & Reis, 1988; Franzoi & Davis, 1985; Rubin & Shenker, 1978). Self-disclosure not only helps them to validate the appropriateness of their cognitions, emotions, and behaviors, but also elicits, through the norm of reciprocity, close, emotionally supportive relationships (Buhrmester & Prager, 1995).

Identity, Intimacy, and Five Characteristics of Internet Communication

Traditionally, adolescents learn and rehearse self-presentation and self-disclosure in face-to-face communication, often with peers and close friends. However, several studies suggest that self-presentation and self-disclosure – in particular to peers and close friends – increasingly take place on the Internet (Davis, 2010; Schmitt, Dayanim, & Matthias, 2008; Schouten, Valkenburg, & Peter, 2007). A possible explanation of why Internet communication is so attractive to adolescents is that, in comparison to face-to-face communication, it enhances the controllability of their self-presentation and self-disclosure (e.g., Schouten et al., 2007; Valkenburg & Peter, 2009b; Walther, 1992, 1996). In other words, young people can decide more easily than in face-to-face

conversations how they present themselves and what they choose to confide in particular others. There is initial evidence that many adolescents are aware of the controllability of Internet communication. In a Dutch study, 45% of the adolescents perceived Internet communication as more controllable than face-to-face communication (Peter & Valkenburg, 2006).

Five features of Internet communication are responsible for the enhanced controllability of self-presentation and self-disclosure. These features, which partly overlap, are: (1) anonymity, (2) asynchronicity, (3) cue management, (4) accessibility, and (5) retrievability. As will be specified below, these features are not inherently beneficial or harmful. The enhanced controllability that results from the five features creates a sense of security in adolescents, allowing them to feel freer in their interpersonal interactions than in face-to-face situations (Walther, 1996). Positively, this sense of security and freedom may loosen restraints and stimulate psychosocial development, for example through the facilitation of self-disclosure, which in turn stimulates friendship formation and maintenance (Valkenburg & Peter, 2009b). Negatively, it may increase uninhibited behavior, such as online aggression or bullying. Thus, the five features of online communication eventually provide adolescents with both opportunities and risks for psychosocial development.

Anonymity

In most Internet applications, adolescents are in command of the extent to which they want to be anonymous or identifiable as persons (although anonymity should rather be seen as a relative anonymity, given the technical problems involved in remaining completely unidentifiable on the Web). They may anonymously post questions about sensitive issues on online support networks, thereby finding information and social support (e.g., Subrahmanyam, Smahel, & Greenfield, 2006; Suzuki & Beale, 2006; Suzuki & Calzo, 2004). Conversely, the possibility of anonymous communication may also result in aggressive and insulting comments, as well as in online harassment of peers and classmates.

Asynchronicity

Some Internet applications, such as instant messaging, allow for communication to take place more or less at the same time (although online communication in such applications is never entirely synchronous). In other applications, such as email and social network sites, communication between partners is typically more delayed. Generally, adolescents' control over the information that they wish to convey grows as the asynchronicity of the communication increases. This allows them to carefully think about and edit information that is relevant to self-disclosure and self-presentation, for example when they design their online profile on a social network site. Conversely,

the asynchronous communication allows adolescents to tailor information such that it may become particularly painful for a target.

Cue Management

The Internet gives adolescents ample opportunity to control the richness of cues with which they present themselves (Schouten et al., 2007). Adolescents can decide whether they present themselves only through textual descriptions or whether they add more cues, for example by including pictures or video clips in their self-description. Moreover, Internet communication gives adolescents opportunities to edit and manipulate these cues (e.g., by means of specific software). On the one hand, cue-richness management and the editability of cues increase adolescents' possibilities to optimize their online self-disclosure and self-presentation. This enhances the opportunities for approval and social acceptance (Valkenburg, Peter, & Schouten, 2006). On the other hand, cue-richness management and cue editability may trap adolescents in uncomfortable situations, for example when they exaggerate their online self-presentation, and subsequently become ridiculed and socially rejected by their peers.

Accessibility

Through the Internet, it has become extremely easy to look up persons and to get in contact with them. The easy accessibility of persons, for example on social network sites, allows adolescents to get in touch with other teenagers who they may not have seen for a long time or whom they cannot easily meet in their offline lives. Similarly, adolescents can conveniently spread information about themselves among a wide variety of people. However, the easy accessibility of persons on the Internet also creates risks for adolescents. For example, they can get in contact with strangers whom many adults may not consider appropriate company for adolescents. In addition, they may more easily become the target of unsolicited contact attempts than in offline settings.

Retrievability

Compared to face-to-face communication, information on the Internet can be retraced easily, often for a long time after it was posted. Moreover, information posted on the Internet can easily be copied and forwarded to others. On the one hand, the easy retrievability of information maximizes adolescents' opportunities to distribute information about themselves with a lot of people over an extended period of time, for example on blogs or social network sites. On the other hand, it enables

others to share information with an unintended audience, long after the information has initially been sent and at times when it may no longer be valid.

Opportunities and Risks of Internet Communication: Empirical Evidence

The five features of Internet communication explain – on a theoretical basis – not only why Internet communication is so attractive to adolescents, but also why it may be beneficial or risky for adolescents' psychosocial development. Recently, researchers have also started to investigate empirically whether Internet communication presents an opportunity or a risk to adolescents' identity and intimacy development.

Identity Development

Internet researchers have focused on two aspects of identity development: self-concept-clarity and self-esteem. Self-concept clarity refers to the extent to which beliefs and opinions about one's self are clearly and confidently defined, internally consistent, and stable (Campbell, 1990). Developing a consistent self-concept is an important developmental task in adolescence (e.g., Steinberg, 2008). Self-esteem is the evaluative aspect of the self-concept, and it usually refers to how adolescents value their selves (i.e., their self-worth) (Harter, 1999, 2003). The development of self-esteem is also an important goal in adolescence.

Self-Concept Clarity

The risks of Internet communication on self-concept clarity are emphasized in two opposite hypotheses, the self-concept fragmentation and the self-concept unity hypothesis. The fragmentation hypothesis states that the ease with which possible identities can be crafted online fragments adolescents' selves. Moreover, the many possibilities for new relationships may confront them with people and ideas that may further disintegrate their already fragile selves (e.g., Gergen, 1991; Reid, 1998). In contrast, the self-concept unity hypothesis states that the Internet gives adolescents more opportunities than ever to get in contact with people of different backgrounds. As a result, adolescents can validate their identities against a vastly expanded social sounding board, which in turn stimulates their self-concept clarity (e.g., Calvert, 2002; Mazur & Kozarian, 2010; Schmitt et al., 2008; Valkenburg & Peter, 2008).

To our knowledge, at least three cross-sectional survey studies have investigated the relationship between Internet communication and adolescents' self-concept clarity (Matsuba, 2006; Mazalin & Moore, 2004; Valkenburg & Peter, 2008). These studies have yielded indecisive results. Two studies have shown that frequent Internet

use and online identity experiments (i.e., pretending to be someone else) were associated with a less stable self-concept (Matsuba, 2006; Mazalin & Moore, 2004). However, more rigorous, multivariate analyses demonstrated the spuriousness of the association between these Internet activities and self-concept as soon as other variables, such as loneliness and social anxiety, were considered (Valkenburg & Peter, 2008). Therefore, current research does not permit the conclusion that the use of the Internet improves or hinders adolescents' self-concept clarity. Other factors, such as loneliness – and thus the lacking opportunity to learn about oneself in an offline social context – seem to influence adolescents' self-concept more strongly than Internet use (Matsuba, 2006; Valkenburg & Peter, 2008).

Self-Esteem

Fluctuations in self-esteem are particularly evident during adolescence (e.g., Harter, 1999). All theories on self-esteem agree that there is a universal desire among human beings to maintain, protect, and enhance their self-esteem (Rosenberg, 1989). Two important antecedents of self-esteem are the control over one's environment and approval and acceptance from others (Harter, 1999, 2003; Leary, 1996). Internet communication may provide adolescents with both of them. As discussed in the previous section, Internet communication enables adolescents to control what they want others to know about them. They can create or modify the presentation of their selves, and they can choose the pace, breadth, and depth of self-disclosure. By experimenting with their self-presentation and self-disclosure, they can optimize the reactions and feedback from their peers and thus enhance their self-esteem.

At least seven studies have investigated the relationship between (forms of) Internet communication and self-esteem among adolescents. Most of these studies have shown that Internet communication increases adolescents' self-esteem. For example, in a study that combined a survey of US adolescents with the analyses of their personal home pages and blogs, Schmitt et al. (2008) found that adolescents indeed experienced a sense of mastery and control through the creation of home pages and blogs. This sense of mastery and control, in turn, was associated with higher self-esteem. The sense of mastery and control was stronger among adolescents than among preadolescents, attesting to the important function of online self-presentation during adolescence.

Focusing on Dutch adolescents' use of social network sites, Valkenburg et al. (2006) also found positive relations with adolescents' self-esteem. The frequency with which the site was used was not directly related to self-esteem; the type of reactions that the teenagers received on their online profiles (i.e., picture and self-description) mediated the effect of use frequency on self-esteem. They found that the more often adolescents used the social network site, the more often they received reactions; and the more reactions they received, the more positive these reactions became. Eventually, these positive reactions were associated with a higher self-esteem. Because the vast majority of reactions to the online profiles were positive, most adolescents benefited from the use of the social network site. However, among 7% of the ado-

lescents, the reactions on their profile were mostly negative. For these adolescents, which involved mostly younger adolescents, their online self-presentation decreased their self-esteem.

In an experiment, Gross (2009) showed that online communication may even restore adolescents' self-esteem. Adolescents who had undergone a laboratory induction of social exclusion and afterwards communicated online with another-sex peer, showed a greater replenishment of self-esteem than adolescents who had been socially excluded and had solitarily played a computer game afterwards. Thus, the study suggests that online communication may help adolescents restore their self-esteem after temporary threats to belonging, which frequently occur in their lives.

The aforementioned studies point to a positive relation between adolescents' communication-oriented Internet activities and their self-esteem. However, none of these studies dealt with compulsive forms of Internet use, that is, an unhealthy attachment to Internet applications (e.g., Caplan, 2002). There is consistent evidence that compulsive Internet use – for instance, an inability to regulate the time spent online or the replacement of face-to-face activities with online activities – is negatively related to self-esteem (e.g., Kim & Davis, 2009; van der Aa et al., 2009). In summary, Internet communication seems to be beneficial for self-esteem only if it is not compulsive in nature.

Intimacy Development

Internet research has focused on whether Internet communication presents an opportunity or a risk for two particular aspects of intimacy development: friendship formation and the quality of existing friendships. In addition, research has dealt with two potential downsides of Internet communication: cyberbullying and relationships with strangers.

Friendship Formation

Research on the effects of the Internet on friendship formation has revolved around two hypotheses, the social compensation and the rich-get-richer hypothesis. The social-compensation hypothesis states that the Internet is particularly beneficial for lonely and socially anxious adolescents. Because of the controllability of Internet communication, these adolescents may more easily overcome the problems they face in offline communication. As a result, they may more easily disclose information about themselves while being online. This eventually facilitates the formation of friendships (e.g., Kraut, 2002; McKenna & Bargh, 1999; Peter, Valkenburg, & Schouten, 2005). The rich-get-richer hypothesis proposes that especially adolescents who already have strong social skills and many offline friends will benefit from the Internet when it comes to friendship formation (e.g., Kraut, 2002; Peter et al., 2005).

Studies on the effects of the Internet on friendship formation found support for both hypotheses. As predicted by the social-compensation hypothesis, lonely and

socially anxious adolescents have been found to prefer online communication to face-to-face communication (e.g., Peter et al., 2005; Pierce, 2009). They more strongly value the controllability of Internet communication and perceive it as broader, deeper and more reciprocal than non-socially anxious and non-lonely adolescent respondents do (Peter & Valkenburg, 2006).

However, there is evidence that, overall, socially anxious and lonely adolescents communicate online less often than non-lonely adolescents do, which is in line with the rich-get-richer hypothesis (Valkenburg & Peter, 2007c; van den Eijnden et al., 2008). This suggests that the greater appreciation of Internet communication by socially anxious and lonely adolescents does not in itself lead to new friendships (for an exception, see Valkenburg & Peter, 2007c). Rather, the occurrence of social-compensation effects may depend on certain conditions.

Research points to three basic conditions that need to be met for social-compensation effects to occur. First, adolescents *need to be motivated* to use Internet communication to compensate for troubles that they encounter in offline interactions. For example, in a Dutch study socially anxious adolescents generally communicated online less often than non-socially anxious adolescents, which subsequently impaired their friendship formation on the Internet (Peter et al., 2005) – an effect that has been replicated in other studies (e.g., Lee, 2009; Valkenburg & Peter, 2007c). However, if adolescents were motivated to use Internet communication to overcome problems they face in face-to-face interactions, they also started communicating more often online and eventually made more friends – a social compensation effect (Peter et al., 2005).

A second condition that needs to be met for social-compensation effects to occur is that socially anxious and lonely adolescents *need to use the Internet for communication* rather than for entertainment and information. As another study from the Netherlands has shown, adolescents with a low quality of friendships felt less lonely when they used the Internet for instant messaging. In contrast, they felt more lonely and more socially anxious when they primarily used the Internet for surfing (Selfhout et al., 2009).

A final condition of social-compensation effects is that adolescents' Internet *activities are not compulsive*. If these activities are classified as compulsive, socially anxious and lonely adolescents typically do not benefit from the Internet. For example, a survey among nearly 8,000 adolescents has shown that socially anxious adolescents were more prone to develop compulsive Internet use. This compulsive Internet use, in turn, was linked with greater loneliness (van der Aa et al., 2009). However, the study was based on a cross-sectional design. As a result, the causal relations found need to be treated with some caution.

Quality of Existing Friendships

Research on how Internet communication affects the quality of adolescents' existing friendships has also revolved around two hypotheses. The displacement hypothesis states that Internet communication impairs adolescents' quality of existing friends, because it displaces the time that could be spent in more meaningful interactions

with offline friends (e.g., Kraut et al., 1998; Mesch, 2003; Nie, 2001). Adherents of this hypothesis assume that the Internet motivates adolescents to form online contacts with strangers rather than to maintain friendships with their offline peers. Because online contacts are seen as superficial weak-tie relationships that lack feelings of affection and commitment, the Internet is believed to reduce the quality of adolescents' existing friendships.

The stimulation hypothesis, in contrast, emphasizes that more recent Internet-based communication technologies, such as instant messaging or social network sites, are designed to encourage communication with existing friends. As a result, much of time spent on Internet communication is used to maintain and deepen existing friendships, which eventually enhances the closeness of these friendships (Bryant, Sanders-Jackson, & Smallwood, 2006; Valkenburg & Peter, 2007b).

Overall, the stimulation hypothesis has received more support than the displacement hypothesis (for a review, see Valkenburg & Peter, 2009b). However, the positive effects on the quality of friendships are conditional. They have been found only when the Internet communication is *anonymous* (in contrast to *anonymous*) and interaction-oriented. Several studies have shown that adolescents only have friendships of higher quality (i.e., greater relationship satisfaction, friends' approval, and support) when they frequently communicated with their friends online through instant messaging (Valkenburg & Peter, 2007b). In contrast, the use of the Internet primarily for entertainment goals (e.g., playing online games, surfing) and for communication with strangers caused the quality of existing friendships to deteriorate (Blais, Craig, Pepler, & Connolly, 2008; Punamaki, Wallenius, Holtto, Nygard, & Rimpela, 2009; Valkenburg & Peter, 2007c).

Existing research points to two more extensions or qualifications of the stimulation hypothesis. First, the stimulation effect also applies to romantic relationships. A longitudinal study among US teenagers showed that, over the course of one year, the use of ICQ ("I seek you," an instant messaging software) improved the quality of romantic relationships (Blais et al., 2008). Second, the positive impact of *anonymous* Internet communication does not only apply to the quality of friendships, but affects the entire friendship process from friendship formation to friendship intensification and the definition of group identities. A Taiwanese study has demonstrated that the use of instant messaging helps adolescents to start and maintain individual friendships; to improve offline relationships; and to articulate a sense of belonging to the group of friends (Lee & Sun, 2009).

An attempt to explain why and how Internet communication can stimulate the quality of friendships is the Internet-enhanced self-disclosure hypothesis (Valkenburg & Peter, 2009b). This hypothesis, which received support in a longitudinal study (Valkenburg & Peter, 2009a), is based on three assumptions. First, in line with Walther's (1992, 1996) social information processing and hyperpersonal-communication model, it is assumed that a better cue management on the Internet creates a safe space that facilitates online self-disclosure. Second, higher online self-disclosure stimulates the quality of adolescents' friendships. Third, online

self-disclosure mediates the direct relationship between Internet communication and the quality of friendships.

Although the bulk of evidence points to a stimulation effect, some studies have yielded no significant relationship between Internet communication and the quality of friendships (Lee, 2009; Mesch, 2001; Subrahmanyam & Lin, 2007). Finally, there are also research findings in support of the displacement hypothesis. However, with the exception of the findings of an Israeli research group (Mesch & Talmud, 2006), these studies were typically done in the early days of the Internet (e.g., Kraut et al., 1998; for summaries, see Lee, 2009; Valkenburg & Peter, 2007b).

Two changes in Internet use may render negative effects on psychosocial development less likely now than when the Internet was new. First, in the early days of the Internet, it was hard to maintain one's existing social network on the Internet because the greater part of this network was not yet online. At the time, online contacts were separated from offline contacts. However, at present, the vast majority of adolescents in Western countries have access to the Internet. At such high access rates, a negative effect of the Internet on the quality of friendships is less likely because adolescents have more opportunities to maintain their social network through this medium. Second, communication technologies that were popular among adolescents in the 1990s, such as chat rooms, were typically used for communication between strangers. However, in recent years several communication technologies, such as instant messaging and social network sites have been developed that encourage adolescents to communicate with existing friends.

Communication with Strangers

Although recent communication technologies encourage adolescents to communicate with existing friends, a minority of them do use the Internet to search for contact with strangers (e.g., Peter, Valkenburg, & Schouten, 2006). Roughly, the studies on Internet communication with strangers can be divided into two lines of research. The first line of research has largely dealt with adolescents who use the Internet to cope with problems they encounter in the offline world. This line of research has generally found positive effects of online contacts with strangers. For example, an analysis of postings on health boards has shown that the typically anonymous communication on such sites provides adolescents not only with concrete information about pressing issues, but also with emotional support (Suzuki & Calzo, 2004). Similar results were reported for adolescents who talked with online strangers about severe diseases, such as cancer, or eating and self-injury disorders (e.g., Suzuki & Beale, 2006; Whitlock, Powers, & Eckenrode, 2006; Winzelberg, 1997). Recently, an experimental study has also demonstrated that an instant messaging session with an unknown opposite-sex peer can restore adolescents' self-esteem after experiences of social exclusion (Gross, 2009).

The second line of research on the effects of contact with online strangers has primarily focused on general online contact with strangers, regardless of the motives of teenagers. This line has found negative effects. For example, a survey study among Dutch adolescents has shown that online talk with strangers reduced adolescents'

well-being. Tellingly, the negative impact of online contact with strangers was most distinct among lonely adolescents (Valkenburg & Peter, 2007a). Contacts with online strangers also seem to moderate the relationship between adolescents' Internet communication and the quality of their friendships. Another Dutch study has shown that only among adolescents who primarily interacted with their friends did Internet communication increase closeness. Among adolescents who primarily interacted with strangers this was not the case (Valkenburg & Peter, 2007c).

Cyberbullying

An important risk of Internet communication is the increasing number of cyberbullying incidents among adolescents, with victimization rates being as high as 53% in some studies (for a review, see Kowalski, Limber, & Agatston, 2008). Cyberbullying occurs when Internet-based applications are used to systematically intimidate or insult a person in order to humiliate, embarrass, or hurt that person. Similar to offline bullying, cyberbullying involves intentional repetitive actions and psychological violence. Unlike offline bullying, however, cyberbullying is characterized (a) by the frequent anonymity or anonymization of the cyberbully; (b) the lacking confrontation of the cyberbully with the immediate impact of the cyberbullying; (c) parents' unawareness of cyberbullying; and (d) the easy accessibility and long-term retrievability of digital manifestations of cyberbullying (Dehue, Bolman, & Vollink, 2008).

The bulk of existing research on cyberbullying has dealt with the characteristics of cyberbullies and victims. Typically, cyberbullies have low levels of social connectedness, externalizing problems (e.g., aggression, delinquency), and use the Internet frequently. Victims of cyberbullying usually have internalizing problems (e.g., anxiety, depression), are often also the victim of offline bullying, and tend to use instant messaging and webcams frequently (for a review, see Vandebosch & Van Cleemput, 2009). Research on the consequences of cyberbullying is still scarce. Correlational studies among US teenagers have shown that being the victim of cyberbullying is associated with increased social anxiety (Juvonen & Gross, 2008), psychological distress (Ybarra, Mitchell, Wolak, & Finkelhor, 2006), and symptoms of depression (Ybarra, 2004). Other US-based studies suggested that being the target of cyberbullying is related to aggressive tendencies, poor anger management, and school problems (Ybarra, Diener-West, & Leaf, 2007a; Ybarra, Espelage, & Mitchell, 2007b). However, none of the available studies has decisively demonstrated whether the various social and psychological problems cause or result from cyberbullying.

Conclusions, Shortcomings, and Future Research

Our review of the literature has shown that Internet communication has important consequences for adolescents' identity and intimacy development. It has also shown

the limitations of both dystopic and utopic views of the consequences of Internet communication for adolescents' psychosocial development. Neither is the Internet a place where adolescents are exclusively confronted with risks that they cannot handle, nor is it a place that, in itself and automatically, would create opportunities for positive psychosocial development. Rather, the nature of effects of Internet communication on identity and intimacy development seems to depend on at least six factors: (1) the predominant use of Internet communication (i.e., whether it is anonymous or nonymous); (2) the type of use (compulsive or noncompulsive use); (3) the type of communication partner (i.e., communication with existing friends or with strangers); (4) the time of data collection (i.e., the effects were more negative in the early stages of the Internet); (5) personality (i.e., the extent of social anxiety and loneliness); and (6) motivations to use a particular technology (i.e., the effects on friendships is beneficial only when the Internet is primarily used for communication rather than for entertainment/information seeking goals).

Although the impact of Internet communication on psychosocial development thus depends on technological, situational, and personal factors, our review clearly suggests that an adequate understanding of today's adolescents' psychosocial development cannot ignore their Internet communication. The thesis that media increase adolescents' possibilities for self-socialization is not new (Arnett, 1995). But never before have adolescents had such a chance to explore their identities with such a multiplicity of means while being so unsupervised by traditional socialization agents such as parents and schools. Our review suggests that, overall, this does not necessarily have to be a cause of concern, but it certainly raises important questions about the future role of parents and schools in adolescents' psychosocial development.

The research we reviewed has debunked several myths about the relation between adolescents' Internet communication and their psychosocial development. At the same time, the reviewed research has created many new insights that enrich our knowledge about the issue. However, there are a number of challenges in this line of research that future studies have to address. First, existing research has not paid sufficient attention to adequate sampling procedures and sample constitution. Several studies employed convenience sampling procedures. Online surveys, in particular, are often based on self-selected samples. The lack of truly random samples endangers the generalizability of the results. Moreover, there is the tendency to generalize from college students samples – emerging adults, thus – to adolescents. From a developmental perspective, this is problematic, not least when processes such as identity and intimacy development are investigated.

Second, many studies have been based on cross-sectional designs. This calls into question whether the impact of Internet communication on adolescents' psychosocial development has been studied rigorously enough. For the further development of the field, it is essential that more internally valid designs be chosen. While several studies based on longitudinal designs have already emerged recently (Selfhout et al., 2009; Valkenburg & Peter, 2009a; van den Eijnden et al., 2008), experimental research is very much needed.

Third, existing research sometimes tends to conflate highly different types of Internet use. As our review has shown, it is crucial that different types of Internet use and Internet communication be conceptually distinguished and assessed separately in their operational translation. For the valid assessment of different types of Internet use and Internet communication, it may be necessary to go beyond traditional self-reported frequency estimates in surveys. These estimates are prone to a number of distortions, ranging from memory errors to social-desirability biases. Alternative methods, such as the media diary method, have elicited promising results (Gross, Juvonen, & Gable, 2002), but are still rarely applied.

Fourth, there is the tendency in some research not to explicate sufficiently where and to what extent Internet communication differs from other forms of communication. As a result, it sometimes remains unclear what we really learn from studying Internet communication beyond what we already know from studies of interpersonal and mass communication. A profound understanding of the role of Internet communication in the psychosocial development of adolescents heavily depends on a stronger integration of the particular features of Internet communication into our theoretical frameworks. This stronger focus on more abstract features of Internet communication may also prevent us from generalizing findings obtained with one particular Internet application to Internet communication in general.

Fifth, much of the existing research has focused on rather simplistic main effects of Internet communication on adolescents' psychosocial development. Although this focus may be understandable given the novelty of Internet communication, it keeps us from a more nuanced view of the processes that underlie these effects. Moreover, it obstructs our view of individual differences in these effects. Investigating which groups of adolescents differ in the effects of Internet communication may greatly enhance our understanding of which adolescents may benefit from Internet communication, and which adolescents may be at risk.

Finally, existing research largely comes from rich Westernized countries. Many other regions and countries of the world are heavily underrepresented. For example, we know little about the extent and the consequences of adolescents' Internet communication in Latin America, Africa, the Arabic world, parts of Eastern Europe, and many countries in Central Asia. Because identity and intimacy development are inherently socially and culturally contingent, it may be that the results we report may change considerably with more research from the aforementioned regions. Cross-culturally comparative research, as has been started in Europe (Livingstone & Haddon, 2009), is therefore urgently needed.

In conclusion, as Internet communication has become so pervasive in the lives of many Western adolescents – scholars, parents, teachers, and practitioners are confronted with new questions about how this form of communication interacts with adolescents' psychosocial development. Although a young and thriving research field has started to address several pressing issues, many more will arise in the following years. At the beginning of the 2000s, few people would have imagined the emergence and success of social network sites. Even fewer people would have predicted that

adolescents would massively use these sites. And nobody would have raised questions about the risk and opportunities that this use may bring about. At the beginning of the 2010s, we are in a similar situation. We do not dare to predict which social Internet application will be the next big success. But we do predict that adolescents will be its defining users. And we also predict that it will be related to adolescents' psychosocial development.

The Role of Parental Mediation in the Development of Media Literacy and the Prevention of Substance Use

Yi-Chun (Yvonne) Chen and Erica Weintraub Austin

ABSTRACT

To provide a more complete picture of the existing state of knowledge regarding parental communication and media literacy in relation to substance use, this chapter discusses (1) parental mediation and its effects on children and adolescents, (2) relationships between parental communication and media literacy, and (3) how each factor (i.e., parental mediation and media literacy) relates to substance use. The chapter includes highlights from a survey that integrates parental communication and media literacy into substance use research among emerging adults. Findings suggest that negative active mediation is effective in fostering competency in media literacy into adulthood, whereas the passive activity of coviewing, the avoidance strategy of rulemaking and the reinforcement of message receptivity in positive mediation are weak or counterproductive influences for media literacy development. Deficiencies in media literacy can lead to risk-taking behaviors among adolescents and may exacerbate those behaviors when they reach emerging adulthood. It is suggested that future research should explore whether similar patterns emerge in other contexts, such as obesity, body image and Internet safety.

Mediation in Homes and Schools

The omnipresent nature of the media, its sometimes questionable content, and its potentially harmful effects frequently alarm those responsible for protecting the welfare of children and adolescents. A plethora of literature has explored approaches that could effectively mitigate children's and adolescents' responses to certain television content and improve their understanding of beneficial content. Perhaps the most noticeable examples of these approaches are grounded either in a familial environment – that is, parental (or primary caregiver-based) communication – or in media education grounded outside of a familial environment, such as media literacy training in educational systems.

Parental communication regarding the media, a multi-dimensional construct that includes active mediation, rulemaking (often called restrictive mediation), and coveiwng, describes the avenues by which primary caregivers approach media use and content with their children, usually in a home environment. Although many scholars believe parents can play an important role in facilitating children's understanding of media messages and in reducing potentially negative effects of television content, many parents fail to engage actively in media-related conversations with their children. As a consequence, not all types of parental communication regarding the media effectively produce prosocial effects.

It seems intuitive that parents should have major influences on their children's uses and interpretations of media in decision-making. Ironically, however, research often has documented parental communication effects regarding media as modest or non-significant (e.g., Austin & Chen, 2003; Ennett, Bauman, Foshee, Pemberton, & Hicks, 2001; Nathanson, 2001a). Because many researchers remain convinced of the importance of the parents' role, the challenge of explaining how and why parents mediate media influences on their children has inspired some to focus on refining measurement and conceptualizations of parental communication avenues. In addition, others have investigated the potential for media education outside the home. Recent developments have included the emergence of professional organizations focused on advocacy, training, and research on media education.

One aim of media education is to give viewers sufficient skills to protect themselves from objectionable content and more effectively select beneficial content delivered through mass media channels (see Chapter 32). Media literacy training thus empowers individuals to use media for the greatest personal benefit instead of merely permitting media producers to use them as profitable consumers. Even though both parental mediation and media literacy can have beneficial effects for modifying children's responses to various media content, no studies to date have connected types of parental mediation to media literacy skills and, in turn, to behavioral outcomes. Parental mediation at its best is media literacy training from the most influential of teachers. It is likely, therefore, that various types of parental communication differentially impact the ways in which children interpret media messages, which in turn

leads to different results in terms of the internalization of media messages and, as a result, different behavioral outcomes as children grow up to draw their own conclusions and make their own choices.

To provide a more complete picture of the existing state of knowledge regarding parental communication and media literacy in relation to substance use, this chapter discusses (1) parental mediation and its effects on children and adolescents, (2) relationships between parental communication and media literacy, and (3) how each factor (i.e., parental mediation and media literacy) relates to substance use. The chapter includes highlights from a new study that integrates parental communication and media literacy into substance-use research among emerging adults. It then ends with discussions of venues for substance-use research and other topics based on the parental mediation and media literacy literature.

Parental Mediation and its Effects on Children and Adolescents

Parental mediation generally is defined as communication from primary caregivers about children's media viewing, particularly grounded in the context of television viewing (Austin, 1993; Fujioka & Austin, 2002; Nathanson, 1999; Valkenburg, Krcmar, Peeters, & Marseille, 1999). Despite the existence of various terminologies and typologies describing types of parental mediation, scholars by and large have come to a consensus that parental communication about media includes three specific behaviors in which parents engage: active mediation, rulemaking, and covieing.

Active mediation or instructive mediation is defined as the extent to which parents or primary caregivers actively discuss certain aspects of television with their children either during or after viewing (Austin, 1993; Fujioka & Austin, 2002; Nathanson, 1999, 2001b). Active mediation seeks to help children interpret media messages by ways of categorization (i.e., how television reflects the world in which we live), validation (i.e., endorsing or criticizing media representation of the world in which we live), and supplementation (i.e., providing additional information to help children understand television messages) (Austin, 1993; Messaris, 1982). The focus of active mediation research emphasizes the occurrence of validation activities within the family, the precursors of various styles of mediation, and the effects of mediation on mitigating children's interpretations of media messages and their behavior (for a review, see Valkenburg et al., 1999).

Active mediation has been linked to children's increased understanding of television, such as educational television and plots (Corder-Bolz, 1980; Desmond, Singer, Singer, Calam, & Colimore, 1985; Singer, Singer, Desmond, Hirsch, & Nicol, 1988; see Chapter 30) and their attention to political affairs news and political involvement (Austin, 1993). Parents and primary caregivers, however, can take on different forms of active mediation, including positive active mediation and negative active mediation

(Austin, Bolls, Fujioka, & Engelbertson, 1999; Austin & Pinkleton, 2001; Fujioka & Austin, 2002; Nathanson & Botta, 2003). Positive active mediation refers to parents' endorsement and support of certain aspects of television programming (e.g., "I like the product on TV" and "I agree with what they just said on TV"), whereas negative active mediation describes parents' negative comments or disapproval of television programming (e.g., "Things on TV are not real" and "The actions done by someone on TV were not okay").

Depending on the nature of media content or caregivers' attitudes toward television messages, caregivers can employ either positive active mediation or negative active mediation to facilitate children's understanding of media messages or mitigate the potential negative impact of objectionable media content (Austin, Knaus, & Meneguelli, 1998; Nathanson, 2001b). The bulk of active mediation research, however, focuses primarily on negative active mediation either explicitly or implicitly by the way active mediation has been operationalized (e.g., Austin, 1993; Buijzen & Valkenburg, 2005; Buijzen, Walma van der Molen, & Sondij, 2007; Fujioka & Austin, 2003; Hoffner & Buchanan, 2002; Nathanson, 1999, 2001b; Nathanson & Botta, 2003). This is likely to be due, in part, to scholars' concern over questionable media content, such as advertising, violent television shows, and shows with sexual content.

Research has shown that negative active mediation can lead to a variety of prosocial attitudinal and behavioral outcomes among children. Studies have found that negative active mediation lessens children's degree of aggression (Corder-Bolz, 1980; Nathanson, 1999; Nathanson & Cantor, 2000) and also successfully modifies children's materialistic attitudes and purchasing requests after exposure to advertising (Buijzen & Valkenburg, 2005). Through reasoning-centered discussion, negative active mediation is also associated with parents' skepticism toward advertising, which in turn is associated with children's critical viewing skills and discussions of political affairs between parents and their children (Austin, 1993; Austin & Pinkleton, 2001; Austin, Pinkleton, & Fujioka, 2000).

Positive active mediation, on the other hand, has received less attention but shows effects distinct from negative mediation. More specifically, research has shown that the effects of positive active mediation on modifying children's understanding of and attitudes toward television greatly depend on what kind of media content parents mediate. For example, positive active mediation has been shown to relate to children's increased learning of cultural television programming, such as opera (Valkenburg, Krcmar, & De Roos, 1998) and educational programs, such as *Sesame Street* (Fisch & Truglio, 2001). Yet, in the context of violent media and alcohol messages, positive active mediation appears to be a counterproductive intervention strategy. It has been found to increase children's imitation of violent media (Hicks, 1968) and to be ineffective in facilitating discussions of political affairs between parents and their children (Austin & Pinkleton, 2001). Positive mediation shows moderate associations with negative mediation and has demonstrated potential for beneficial outcomes as noted previously, but negative active mediation appears to be more effective as a protective strategy against problematic media content and

persuasive influences after considering the age of the child and type of content. In addition, negative mediation appears to be more effective for fostering critical-thinking abilities and media skepticism among children (Austin, 1993; Austin et al., 2000; Buijzen & Valkenburg, 2005; Desmond et al., 1985; Fujioka & Austin, 2003).

A second type of parental communication strategy is rulemaking, often referred to as restrictive mediation. This describes how parents set rules for television viewing hours or for prohibiting the viewing of certain content (Valkenburg et al., 1999). Most of the rulemaking is related to *what* children can watch rather than *how much time* they can spend with media (Kaiser Family Foundation, 2010). A recent report shows that younger children (8- to 10-year-olds) have significantly more rules about which shows they can watch than children who are 15 to 18 years old (Kaiser Family Foundation, 2010).

From a protectionist perspective, parents who use this communication approach express concern that television watching is potentially harmful to their children, particularly younger children (Barkin, et al., 2006; Kaiser Family Foundation, 2010; Lin & Atkin, 1989; Warren, 2005; Wiman, 1983). Because it represents an avoidance strategy and does not facilitate critical discussion, however, we believe it is a stretch to refer to rulemaking as “mediation.” Indeed, it can facilitate family discord without providing constructive opportunities for critical analysis of actual content. As a result, to the extent children require rehearsal and experimentation with decision-making to develop independent communication competence, rulemaking represents a counter-productive approach to media effects intervention. In other words, simply prohibiting children from watching potentially objectionable content does not facilitate their autonomy in making important decisions regarding key issues (not to drink alcohol, not to use tobacco, to solve conflicts without aggression, etc.)

Having some rules that limit amounts of media use can be beneficial, particularly for young children not yet able to interpret many aspects of a message on their own (Baranowski, Baranowski, Thompson, & Greaves, 2005; Desmond et al., 1985; Nathanson, 1999). For example, in a study of low-income preschool children in New York, the odds ratio of children having a body mass index above the 85th percentile increased 1.06% for each additional hour of television viewing (Baranowski et al., 2005). In addition, having some rules associates with less media use overall – an average of almost three hours less among 8- to 18-year-olds – perhaps encouraging selectivity (Kaiser Family Foundation, 2010). Much of children’s media use is unsupervised, however, with 71% of children (76% of adolescents) having television in their bedrooms, and about a third having computers and Internet access in their bedrooms. As a result, prohibitions often have limited impact as young people obtain unsupervised access to media within the rules or by circumventing them at friends’ houses. Rulemaking, therefore, can encourage some degree of selectivity but has limited effects in the absence of active guidance that helps children practice using information sources critically in their decision-making. For example, research has shown that rulemaking is associated with children’s positive attitudes toward television shows with objectionable content, such as violent and sexual media, more

viewing of the content with their friends, and children's negative attitudes toward their parents (Buijzen et al., 2007; Nathanson, 2002).

The third type of parental communication strategy is *coviewing*, in which primary caregivers and children watch or enjoy a television program together without engaging in any discussion activities. Some scholars conceptualize coviewing in ways consistent with positive mediation, referring to it as *social coviewing* (Valkenburg et al., 1999). While active mediation and rulemaking often are indicators of either parents' concern about television effects or their (dis)approval of the programs, parents' own positive attitudes toward the programs (e.g., liking) strongly predict their coviewing behavior with the child (Nathanson, 2001b). Children often interpret coviewing with parents or primary caregivers as parental approval of television programming; apparent endorsement of certain messages, such as violent television shows, is often positively associated with children's television-induced aggressive tendencies and behavior (Krcmar, 1998; Nathanson, 1999, 2001b). Although coviewing caregivers may not expressly endorse content during viewing, it has long been established that a lack of negative reinforcement can be interpreted as endorsement, particularly in ambiguous or antisocial situations (Bandura, 1965). As a largely passive activity, therefore, coviewing produces little in terms of positive effects on children's decision-making (Dorr, Kovacic, & Doubleday, 1989) and appears primarily to reinforce children's perception that television characters are real and representative of people in the real world (Messaris & Kerr, 1984).

Parental Mediation and Substance Use

Research that examines parental mediation as it relates to substance-use attitudes, behavioral intention, and behavior among children and adolescents has revealed the extent to which parental factors reinforce or ameliorate positive imagery of substance use in the media (Austin et al., 2000; Austin & Chen, 2003; Dalton et al., 2006; Fujioka & Austin, 2003; Hanewinkel, Morgenstern, Tanski, & Sargent, 2008). In the context of alcohol advertising, Fujioka and Austin (2003) found that third, sixth, and ninth graders' self-reported parental mediation is linked to their decision-making concerning alcohol. Characters in alcohol advertisements were attractive and fun for children whose parents provided positive comments about advertisements at home. A positive relationship between active positive mediation and identification with characters in advertisements also was found. Children's self-reported active negative mediation was not related to their decision factors, however.

Expanding the study by Fujioka and Austin (2003), Austin and Chen (2003) self-reported results from a dataset that surveyed emerging adults. Consistent with prior research (Fujioka & Austin, 2003), recalled parental active positive mediation had a positive association with emerging adults' perceived desirability of alcohol advertising. Active positive mediation was further linked to their perceived positive conse-

quences of alcohol experimentation and use, which was directly linked to greater alcohol use and alcohol experimentation at a young age.

Research conducted by Dalton et al. (2006) and Hanewinkel et al. (2008) has found that prohibiting children from watching “R-rated” movies and coviewing R-rated movies with their children each independently decreased children’s risk for smoking and drinking. In summary, positive active mediation, in comparison to other forms of parental intervention, seems to be a risk factor that directly impacts the pathway through which positive portrayals of substance use are reinforced and behavior emulation and enactment are strengthened.

Relationships between Parental Communication and Media Literacy

The overall assumption underlying existing research regarding parental communication strategies has been that parents, as primary influencers and information sources for their children, should have considerable effects on their children’s development of media literacy skills. Some strategies, however, appear to have greater effectiveness than others, and not all parents appear to be sufficiently media literate themselves. For example, parents sometimes know less than their children do about new technologies or popular topics (Livingstone, 2004). Others are unwilling to discuss objectionable content preferring – often unrealistically – to simply keep it at bay. As a result, media literacy education has become increasingly embraced as an essential skill for public education. All 50 United States, for example, now have media literacy principles instilled in their Standard of Learning requirements in social studies, language arts, or health and consumer education (Baker, 2010).

Conceptualizations of media literacy have become more precise and consistent as this interdisciplinary field has grown in sophistication; also, avenues for cross-discipline sharing of ideas have increased. Media literacy education generally is defined as an individual’s ability to access, analyze, evaluate, and create media in a variety of forms (Aufderheide, 1993; see Chapter 32, this volume). The four crucial media literacy components – access, analysis, evaluation, and content creation – emphasize media literacy as a “skills-based approach” to media awareness education (Livingstone, 2004). Particularly in terms of providing systematic pedagogical approaches and opportunities for content creation, school-based media literacy education has presented some advantages over home-based, caregiver-sourced communication strategies. In addition, some curricula have targeted concerned teachers and parents as students, to help them more effectively teach children about the media (Brown, 2001; Buckingham, 2005; Singer & Singer, 1998). Given the primary nature of caregivers as influencers despite the potentially systematic, comprehensive approaches offered by trained educators, it is important for research to establish more specifically how parental

communication strategies contribute to media literacy skills, particularly in terms of caregivers' probable emphasis on the skills of access, analysis and evaluation.

As an empowerment education strategy that fosters healthy skepticism and reflective-thinking skills, media literacy education frequently emphasizes the understanding of persuasive intent and techniques as a fundamental skill that will motivate further analysis and evaluation (e.g., Austin & Johnson, 1997a, 1997b). Many educational programs therefore provide youngsters with knowledge about how advertising controls the media industry, intended to help them understand that advertising and television programming are purposefully crafted to capture the attention of predetermined audiences (Bazalgette, 1991; Hobbs, 2001, 2007; Piette & Giroux, 2001; Villani, 2001). Media literacy activities often involve analysis of the underlying purpose for the advertisement, its intended target audience, its persuasive techniques, and its content elements as part of the instruction intended to foster improved media literacy skills (Austin, Chen, Pinkleton, & Quintero Johnson, 2006; Brown, 1991, 1998, 2001; The Center for Media Literacy, 2005; Pinkleton, Austin, Cohen, Miller, & Fitzgerald, 2007).

Media Literacy and Substance Use

Youngsters gain competency in critiquing, evaluating, and interpreting media messages by drawing from their knowledge structures. As children develop greater cognitive sophistication and the ability for abstract thinking, they become better able to generalize lessons from media literacy to other contexts, such as substance use, in which they need to evaluate information for use in decision-making that could later impact their behavior. Media literacy engages youth in critical analysis of glamorized and unrealistic depictions of advertising messages and encourages youth to produce counteradvertising messages to "talk back" to the media industry. This approach not only modifies youth's responses to substance-use advertising messages, but also empowers them to reflect on the negative impact media might have on their health.

Theoretically based media literacy has become an effective tool to prevent or alter substance-use behavior among youth (Austin, Pinkleton, Hust, & Cohen, 2005; Banerjee & Greene, 2007; Johnson, 1997a, 1997b; Pinkleton et al., 2007; Pinkleton, Austin, Cohen, Chen, & Fitzgerald, 2008;). Built on the message interpretation process model, Austin and Johnson (1997a) designed an experiment that compared results from the general and alcohol-specific media literacy training with third graders. Inspired by the theoretical principles of parental mediation, the alcohol-specific media literacy training discussed various aspects of advertising representations, such as categorization (e.g., Is it real or not real?), validation (e.g., Is it right or wrong?), and supplementation (e.g., media messages do not represent real-life examples). This technique, in comparison to the general media literacy training that only focuses on advertising skepticism, was more effective in increasing third graders'

understanding of the media. In general, the treatment group participants had an increased understanding of alcohol advertisers' persuasive intent, which then led to a decreased level of expectancies for alcohol consumption a few months later compared to third graders who did not receive such training (Austin & Johnson, 1997a, 1997b). Gender differences also were observed in the treatment group as girls were more likely to indicate a lower likelihood of alcohol use than boys.

Integrating Parental Communication, Media Literacy, and Substance Use

Even though the familial environment factor (e.g., parental communication) and the individual factor (e.g., level of media literacy) examined in this chapter each have been uniquely linked to substance use, the literature has yet to examine the conjoint influence of parental mediation and media literacy as they relate to substance use. Fortunately, young adulthood provides an opportune time to examine the confluence of primary caregiver influences and media literacy skills as predictors of decision-making outcomes.

A natural connection exists between active parental mediation and media literacy. When the media content in question is presumed or shown in prior research to lead to negative effects, the link can be disrupted through *negative* active mediation and media literacy education. Both approaches aim at effectively increasing youngsters' skepticism toward advertising and other media portrayals by training them to use critical-thinking skills and consider what is present along with what is missing in a given message. By the time they are emerging adults, media literate individuals should possess critical-viewing skills enabling them to identify a variety of visual symbol representations and meanings embedded in messages, to determine effects of the media, and to understand points of view presented in messages (Brown, 1991, 1998, 2001).

As a result, negative active mediation should predict higher levels of media literacy skills, particularly as represented by the existence of critical thinking and skepticism toward advertising and, more generally, the media portrayals. Positive active mediation, on the other hand, seems to reinforce the persuasive aspect of media messages, such as alcohol advertising (Austin et al., 2000; Fujioka & Austin, 2002), and should be negatively associated with media literacy outcomes. In addition, prior research has suggested that avoidance and passive communication strategies characterized by rulemaking and coviewing do not enhance critical-thinking skills in children and do not necessarily prevent children from accessing objectionable content. Simply put, limiting access to the content children could watch and coviewing are expected to detract from emerging adults' comprehension of the complex interrelations of advertising and the media industry.

We recently collected data from emerging adults to explore these issues. Participants were recruited from a large mid-Atlantic university to participate in one of two cross-sectional Internet-based surveys. Two versions of the survey were created to focus either on alcohol-use behavior or on tobacco-use behavior. Both contained previously validated parental mediation activities (Austin, 1993; Austin et al., 1999; Austin et al., 2000; Fujioka & Austin, 2003; Nathanson, 2001b, 2002; Nikken & Jansz, 2006) and media literacy measures, operationalized as skepticism for advertising, media skepticism and critical thinking (Austin & Pinkleton, 2001; Austin et al., 2005; Austin et al., 2006; Fujioka & Austin, 2003; Pinkleton et al., 2008). The surveys were administered through an online research participation system that included undergraduate students from various disciplines across the university. Results are reported here for the general sample and for alcohol use as a behaviorally based dependent variable.

Emerging adults, roughly defined as individuals aged 18 to 25, face as many identity exploration and formation challenges as adolescents do (Arnett, 2000). Emerging adults are considerably more independent from their adolescent years, but are not entirely ready to embrace the responsibilities of adulthood. A significant characteristic of emerging adulthood is the continuous cognitive and identity development through the late teens and the twenties (Arnett, 2000). Therefore, this period is appropriate in that the results may shed light on the role of active and passive parent-child communication about the media in fostering emerging adults' media literacy skills in order to document their direct and indirect effects on current substance-use behavior.

We expected to find that negative active mediation would predict higher levels of media literacy among emerging adults as represented by skepticism toward advertising, skepticism toward media, and critical thinking, whereas positive active mediation, rulemaking, and coviewing would predict lower levels of media literacy among emerging adults. In addition, we thought it especially likely that higher levels of media literacy would predict lower levels of alcohol and tobacco use among emerging adults.

Given the primary nature of caregiver influences, we thought it would be possible to trace these direct effects of parental communication strategies even into adulthood. Generally, for example, in the context of substance use, previous studies have shown that parental discussion-based intervention strategies either reinforce or counter-reinforce substance-use messages in the media, which then associate with higher levels of alcohol and tobacco experimentation and use among adolescents (Austin et al., 2000; Fujioka & Austin, 2002; Jackson, 2002). Overall, the literature appears to suggest that parental reinforcement (i.e., positive active mediation and passive coviewing) and counter-reinforcement (i.e., negative active mediation) will continue to affect emerging adults' behavioral intentions and behavior (Kafka & London, 1991). In our study, we tested whether positive active mediation and coviewing would predict higher levels of alcohol use among emerging adults, and whether negative active mediation would predict lower levels of substance use. We also tested for effects of rulemaking, because parental mediation research rarely has tested how rulemaking affects young people's behavioral choices.

Table 33.1 Associations between parent–child communication about media and media literacy

Dependent variables/ independent variables	R ² change	<i>b</i>	<i>df</i>	F
Advertising skepticism				
Age	.01**	−.11**	(1,636)	7.68**
Positive mediation	.03***	−.19***	(2,635)	15.45***
Negative mediation	.01*	.11*	(3,634)	12.59***
Coviewing	.01*	−.10*	(4,633)	10.79***

Critical thinking				
Negative mediation	.03***	.18***	(1,636)	21.84***
Coviewing	.01*	.10*	(2,635)	14.05***
Rulemaking	.01*	−.10*	(3,634)	11.15***
Total R²	.05			

Note. All betas are standardized. Control variables were entered first using the stepwise procedure; thus, they entered the equation when they were significant. Standardized betas reported from the block of entry. Independent variables entered using the stepwise procedure in a single block.

* $p < .05$, ** $p < .01$, *** $p < .001$.

The results revealed that mediation and coviewing variables had distinctive relationships with media literacy measures, such that coviewing predicted less advertising skepticism but more critical thinking, negative mediation consistently associated with higher levels of media literacy, rulemaking associated with lower levels of critical thinking, and positive mediation associated with lower levels of advertising skepticism but was unrelated to critical thinking.

Even with demographic variables and media literacy variables controlled, parental coviewing was positively associated with increased levels of alcohol use. Negative and positive mediation had no direct relationship to current alcohol use. Media skepticism predicted lower levels of current alcohol use, but advertising skepticism and critical thinking were unrelated to the behavioral measures of substance use. For detailed results, see Table 33.1 and Table 33.2.

Conclusion

The abundant media effects literature has repeatedly concluded that exposure to potentially harmful media messages directly impacts youth's behavior through their

Table 33.2 Associations among parental communication, media literacy, and alcohol use

Dependent variables/ independent variables	R ² change	B	df	F
Alcohol use

decision-making processes. Two approaches – parental communication and media education – have been investigated to theorize possible mitigating pathways through which negative media effects could be countered and positive effects amplified. Parental communication and an individual's level of media literacy may each have a waxing and waning influence throughout a child's developmental trajectory. Within the familial environment, parental communication about the media has garnered much attention as primary caregivers, to some degree, shape and form younger children's conceptual understanding of the media.

Not all types of parental communication lead to positive outcomes in children, however, especially when the questionable media content (i.e., violent, sexual, alcohol, and tobacco messages) is examined. Within that context, negative active mediation is found to be effective in reducing youth's positive attitudes toward the questionable content and behavioral intention of imitating the depicted behavior. On the other hand, positive mediation, rulemaking, and coviewing generally produce more harm than good in that positive attitudes toward the content appear to lead to behavior enactment. For example, positive mediation associates with increased levels of youths' desirability toward alcohol advertising and wishful identification with its characters.

Similar to the positive outcomes of negative active mediation, media literacy education, the other commonly used approach for mitigating negative media influences, has enjoyed much success in substance-use prevention and intervention among youth. By developing an individual's ability to critically analyze and produce countermedia messages to "talk back" to the big media industry, media education increases youth skepticism toward advertising, enhances reflective thinking and lowers behavioral intention toward substance use.

The direct and indirect impact of parental communication and media literacy is best examined through emerging adulthood as parental influences may still have the residual effects that influence their media literacy levels. The condensed results

reported in this chapter are the first to establish that certain forms of parent-child communication about the media are associated with emerging adults' media literacy skills. These results also confirm that parental communication and media literacy skills independently shape emerging adults' substance-use behavior.

One of the contributions of this research is to extend parent-child communication about the media and media literacy research to the context of emerging adults. Much of the research on parental communication and media literacy focuses on children and adolescents. Yet, very little research has concentrated on the interrelations between emerging adults' past parental communication and their current media literacy skills. This chapter suggests that negative active mediation is effective in fostering children's competency in media literacy into adulthood, whereas the passive activity of covieing, the avoidance strategy of rulemaking and the reinforcement of message receptivity inherent in positive mediation are – at least in isolation – weak or counterproductive influences for the development of media literacy skills. On the other hand, deficiencies in media literacy can lead to risk-taking behaviors among adolescents and may exacerbate those behaviors when they reach emerging adulthood. It will be important for future research to explore how these influences interrelate with a more diverse population, to test hypotheses with longitudinal datasets, to examine these factors in other contexts (e.g., violence, obesity, body image, other substance-use behavior, and Internet safety), and to investigate whether the same patterns would be observed when studying positive media programming. In addition, it will be valuable to include the role of other communication mediators, such as peer and sibling interaction, in the study of how children develop independent information selection and processing skills that ultimately lead to important behavioral decisions.

The Impact of Media Policy on Children's Media Exposure

Amy B. Jordan

ABSTRACT

Children's media policy is designed with two primary goals: first, to increase children's access to beneficial content; and second, to decrease their exposure to harmful content. This chapter explores the principles on which US children's media policy has been established. It then outlines current US media policies that address content deemed to be detrimental to children (including junk food advertising and violent content) and seek to improve access to media technology and educational content that is considered beneficial to children (such as E-Rate and the Children's Television Act). In addition to reviewing media policies, the chapter considers research on the implementation and impact of the policies, including the abject failure of the V-chip legislation and the ongoing discourse about privacy protection. The chapter concludes by arguing the need for a more deliberate use of effects research in the development and evaluation of children's media policy.

Foundations of Media Policy

In the United States, as in many countries, children's media policy is designed with two primary goals: first, to increase children's access to beneficial content; and second, to decrease their exposure to harmful content. At the same time, those who

craft policy are mindful of the important protection that the First Amendment provides to those who create and distribute media, including commercial content. Policymakers ultimately strive to walk a fine line between worthy but sometimes competing principles: the media's right to free speech and society's interest in protecting and educating the nation's children.

This chapter explores the foundational principles on which US media policy has been established, primarily as the principles relate to the child audience. It then outlines current US media policies that address content deemed to be detrimental to children and seek to improve access to media technology and educational content that is considered beneficial to children. In addition to reviewing media policies, the chapter considers research on the implementation and impact of the policies. The chapter concludes by arguing the need for a more deliberate use of effects research in the development and evaluation of children's media policy.

In the United States, judicial bodies have tended to favor the "least restrictive" approach to ensuring that children are not exposed to age-inappropriate content (Levesque, 2007; Napoli, 2001). Policies that have infringed on the rights of adults to access legal content, such as pornography, have been routinely struck down by the courts (Blevins & Anton, 2008). The Communications Decency Act, for example, proposed to ban indecent and pornographic content from the Internet in the interest of protecting children (Blevins & Anton, 2008). Opponents argued that the Act was a form of censorship, and that it would infringe on adults' rights to access such legal content. Judges agreed, and argued that other measures – such as media education and blocking technology – would provide an alternative means for protecting children (Levesque, 2007). Commercial speech is also deemed to be protected by the First Amendment. Those who would seek to persuade consumers to purchase products are allowed to disseminate their message in any form and to any audience as long as it is not deceptive or misleading (Napoli, 2001). In *Central Hudson Gas & Electric Corp. v. Public Service Commission* (1980), the US Supreme Court laid out the four-step analysis to determine whether commercial speech regulation is constitutional. In what came to be known as the *Central Hudson Test*, Justice Powell proposed the following questions: (1) Is the expression protected by the First Amendment? For speech to come within that provision, it must concern lawful activity and not be misleading; (2) Is the asserted governmental interest substantial? (3) Does the regulation advance the governmental interest asserted? and (4) Is the regulation more extensive than is necessary to serve that interest? Thus the notion of the protection of commercial speech was concretized, as was the notion of the least restrictive means of regulation.

The privileging of the free speech rights of advertisers and media companies has created an environment in which the industry is encouraged to self-regulate. When advocacy groups express concern or when lawmakers begin to make inquiries into media practices, the industry is often stirred to preemptive self-censorship (Freedman, 2008). Since networks and advertisers are loathe to risk action by Congress, the Federal Trade Commission, or the Federal Communications Commission, they are

on alert for signs of public disapproval and potential new federal actions. This dynamic has been described by Kunkel (1988) and Starr (2004) as “regulation by raised eyebrow” and will be discussed at greater length later in the chapter, as we consider self-regulatory efforts by the industry.

Despite the reticence of the courts to limit speech, there is a long history of regulation in broadcast media. In the early days of radio broadcasting, the federal government recognized the enormous potential of the medium as a public resource for providing information to keep citizens safe, informed, and connected. With the Federal Radio Act of 1927, and later the Communications Act of 1934, a regulatory body was set up to provide licenses, to allocate portions of the spectrum to license holders in both radio and television broadcasting, and to ensure that licensees meet the “public interest, convenience and necessity” (Jordan, 2008). Unlike other media of its day, such as newspapers or film, broadcast radio, and later television was seen as a scarce resource (Jordan, 2008). The Telecommunications Act of 1996, which represented the first major overhaul of the 1934 Act, added new expectations for broadcasters, clarified the role of the FCC in overseeing cable channels, and introduced new regulations for the Internet. Today, the Federal Communications Commission (FCC) is charged with carrying out the laws of Congress, processing applications and renewals for broadcast licenses, providing guidelines to the telecommunications industry on issues such as network neutrality and digital television, and ensuring that the needs of children and the concerns of parents are being addressed.

The extent to which the FCC is active or *laissez-faire* and the types of issues the regulatory agency focuses on tends to reflect the political leanings and interests of the presidential administration (Kunkel, 1998). The agency is made up of five commissioners nominated by the president and confirmed by the US Senate for five-year terms (Napoli, 2001). As might be predicted, appointees within the same party as the president will reflect the views of the administration. For example, the United States witnessed a period of deregulation of media, including a loosening of ownership restrictions, during the Reagan/Bush era (McChesney, 1999), and then a renewal of interest in the ability of the FCC to encourage better quality children's television during the Clinton/Gore administration (Kunkel, 1998).

The rapid development and adoption of new media technologies has presented challenges for regulatory agencies. Rules are often applied in accordance with the media platform rather than the media content. For example, commercial broadcasters (one kind of platform) are mandated to provide educational programming for children, but cable casters (another kind of platform) are not. Yet all channels are required to limit advertising during children's programming (Jordan, 2008). Some words are deemed indecent on some television channels (and are subject to heavy fines for indecency) while on other channels profanity is commonplace. Distinctions between broadcast and cable channels are important for regulatory agencies, but are invisible to parents, who tend to see all television channels as “television” (Schmitt, 2000). With media converging, the platform approach to media regulation may be obsolete, particularly as children are increasingly likely to watch television on the

computer via network websites and collaboratives such as Hulu.com (Kaiser Family Foundation, 2010). Moreover, as the number of “broadcast” channels increases exponentially after the digital switchover, the original premise of regulation based on the scarcity principle must be called into question. Simply put, the notion that broadcast media are scarce resources; that is, that there are more individuals who want to broadcast than there are frequencies available, may no longer be a good rationale for media policy-making.

Federal Children’s Media Policies

This section of the chapter focuses on the ways in which federal policy shapes media content consumed by children. First, the government can encourage the provision of programming it feels serves the public interest – in this case, by addressing the educational needs of the child audience. Second, policies can be put in place that aim to reduce children’s exposure to age-inappropriate or otherwise harmful content – for example, exposure to cursing, sex, violence, or excessive or misleading advertising. In some cases, a policy may be designed to do both. The Children’s Television Act of 1990, as we will see below, is legislation that addresses the “good” (by encouraging the provision of educational programming) and also the “bad” (by limiting the practice of host selling in advertising).

The Children’s Television Act of 1990 and the Subsequent 1997 FCC Processing Guideline

Television during the 1970s and 1980s was perceived by child advocacy groups, such as the Action for Children’s Television (ACT), as devoid of enriching and educational content and teeming with commercials and violence (Jordan, 1996). By 1990, after a decade of lobbying by ACT and others, Congress passed the Children’s Television Act (CTA). The Act was significant in two respects. First, it took on the hypercommercialism of children’s television by reestablishing advertising time limits on children’s programming that had been eliminated during the Reagan years of deregulation, and by banning the practice of “host selling” wherein characters from the television program pitch products during ad breaks within and adjacent to that program. Second, the CTA required broadcasters to significantly increase educational and informational program offerings for children (Kunkel, 1998).

Research conducted by Kunkel and Canepa (1994), the Center for Media Education (1992), and The Annenberg Public Policy Center (Jordan, 1996) found that the CTA of 1990 did not yield significant changes in the broadcasters’ educational offerings. Programs that were labeled as educational were often of dubious educational value. The cartoon show *The Jetsons*, for example, was justified as educational because it

taught children about the future (Center for Media Education, 1992). Researchers at the Annenberg Public Policy Center looked at the 1995–1996 broadcast season a full five years after the CTA went into effect. They found that the few truly educational programs that were airing in the Philadelphia market – such as *Bill Nye, the Science Guy* – were on so early in the morning (e.g., 5:00 a.m. on Saturday) that it was unlikely that any children would be awake and in the audience (Jordan, 1996).

After evaluations of the implementation of the CTA were released, and after both President Clinton and Vice President Gore became involved in the issue of children's educational television, the broadcasters accepted new guidelines from the FCC (Kunkel, 1998). Informally known as the Three-Hour Rule, the 1996 FCC processing guidelines stipulated that to be considered for automatic license renewal broadcasters must air three hours a week of core educational programming for children. Core programs must air between 7:00 a.m. and 10:00 p.m., be labeled as educational on the air, be specifically designed for children, and be regularly scheduled (FCC, 1996).

The more specific guidelines made a difference. Prior to the implementation of the Three-Hour Rule, the amount of time devoted to educational programming varied widely depending on the local station, which often relied on locally produced or syndicated programming to meet its educational program requirements (Kunkel & Canepa, 1994). With the national networks providing “FCC friendly” educational programs to its affiliates, most stations were able to meet the minimum weekly requirements. Assessments of the educational quality of the programs by the Annenberg Public Policy Center (see Jordan, 2000) and by the advocacy organization Children Now (see Wilson, Kunkel, & Drogos, 2008) reveal that the majority of programs are educational, though each year roughly one-fifth to one-quarter are judged to be of minimal educational value. Broadcasters still make dubious claims about what their programs teach. Additionally, the mere presence of educational programs on the broadcast channels does not necessitate a large child audience. Ultimately, it is unclear the extent to which the mandate has impacted children's viewing choices.

Research by Schmitt (2000) reveals that parents do not recognize the symbol that indicates educational programming (see Figure 34.1). “E/I” (which stands for “educational and informational”) is not a meaningful cue to them. As a result, parents are unlikely to encourage their children to watch more enriching fare on broadcast stations. In addition, the majority of programs that air as core educational programs are what scholars call “prosocial.” Prosocial television shows are programs which teach children lessons about subjects like friendship or honesty rather than address traditionally academic subjects such as math or science (Jordan & Woodard, 2004; Wilson, Kunkel, & Drogos, 2008; see Chapter 29, this volume). Research suggests that prosocial programs are not viewed by parents as “educational,” even though they meet the FCC's definition for what would count as educational (Schmitt, 2000).

Broadcasters complain that educational programs are less profitable than entertainment cartoons, and that children will simply watch entertainment shows on cable channels that do not have to comply with the FCC's educational television guidelines.

Figure 34.1 Educational TV (E/I) icon on ABC's *The Emperor's New School*.

But observers note that it is likely that broadcasters would have stopped airing any programs for children, particularly since adult programming is so much more profitable. Thus, one could argue, the mandate ensured that the child audience was served in a meaningful way (Jordan, 1996). Independent producers complain that there is no longer a market for their educational fare, since the networks and their affiliates find it cheaper to make or acquire it at the national level, and since they can charge more for advertising space if the “reach” is greater (Jordan & Sullivan, 1997). Locally produced educational programming for children is now obsolete in most markets (Sullivan & Jordan, 1999). Despite these unintentional consequences, however, legislation has resulted in a substantial increase in the presence of educational and prosocial programming for children on the broadcast networks.

The Telecommunications Act of 1996 and the V-chip Mandate

The Telecommunications Act of 1996 represented a massive overhaul of the 1934 Communications Act, although it continues to structure policy on a medium-by-medium basis in much the same way as the original law. For example, broadcast media stations such as Fox or ABC do not enjoy the same First Amendment protections as Comedy Central or HBO. The Telecommunications Act represented significant shifts, however, and one of the most noticeable changes it brought to the screen was the system of ratings and the technology to block programming based on these ratings (see Figure 34.2).

The system of rating television programs for age and content was designed by an industry advisory board, not by federal regulators; although the Telecommunications

Figure 34.2 Age and content rating for Fox TV's *American Idol*.

Act said that if the industry did not come up with a system then the regulatory agency would do so for them. Age-based ratings indicate the appropriateness of programs for children of different ages (e.g., TV-14 suggests content is appropriate for children aged 14 and older). Content ratings flag the presence of content that parents might find objectionable, such as harsh language (L), sex (S), or violence (V). By 1998, most producers and programmers began labeling their shows using a system that followed the basic structure of the movie ratings (Cantor, 1998). The impetus behind the ratings was two-fold. First, policymakers believed that providing parents with information about the appropriateness of programming would empower them to more effectively direct children's viewing. Second, the Telecommunications Act required that computer chips be built into television sets manufactured after the year 2000. The computer chips, which had been developed and implemented first in Canada, could be programmed to read these ratings and would allow parents to block shows with certain kinds of content. The computer chip, known as the V-chip, became widely available by the year 2000.

Evaluations of the ratings and the V-chip mandate have shown that the policy was of limited success (Kaiser Family Foundation, 1998; Scantlin & Jordan, 2006). Surveys of parents have shown that television ratings are used much less frequently than movie ratings as a guide for children's viewing (Kaiser Family Foundation, 2004). One reason may lie in the fact that ratings across media are idiosyncratic. A ratings indicator for child-appropriate content for the medium of television would be TV-Y or TV-Y7; while for movies it would be G or PG; and for videogames it would be EC or E (Jordan, 2008). The content labels are equally confusing, and not universally applied. The content rating FV in children's programming (see Figure 34.3) means that there is "fantasy violence," but parents are more likely to think it means "family

Figure 34.3 Age and content rating for Cartoon Network's *Chowder*.

viewing” (Schmitt, 2000). Despite these shortcomings, the presence of labels to signify potentially objectionable content on television and the means by which concerned parents and caregivers could limit access to such content have been a significant development in media policy.

Research conducted by both the Annenberg Public Policy Center (APPC) (Scantlin & Jordan, 2006) and the Kaiser Family Foundation (2004) has also indicated that the V-chip blocking device is neither well-understood nor frequently used. In an APPC field experiment, families were provided with V-chip equipped television sets just as the TVs were becoming available to the general public (Jordan & Woodard, 2004). In the “high information” condition, parents were told about the ratings and instructed as to how to program the V-chip to block shows they did not want their 7- to 13-year-old children to see. In the “low information” condition, parents were provided with the V-chip equipped television set and briefly told about the feature as well as other features of the set (such as the sleep timer). In the “control” condition, families were not provided with a television set, but were tracked over the same period. At the end of the nine-month study, parents in the high-information condition were significantly more likely to try to program the V-chip than parents in the low-information or control condition. Overall, however, of the 150 families in the study less than 10% of the participants had engaged their V-chip or any other blocking technology as a means to control children’s viewing. Interviews with a subsample of parents in the study suggest that some felt it simply unnecessary to use a technological device to mediate television, but many found the V-chip menu confusing to navigate (see Figure 34.4) and the program ratings difficult to understand. In addition, since most homes had more than one television set, children whose choices are thwarted on the V-chip-equipped TV were seen as having the option to simply go to another room

Figure 34.4 V-chip programming screen.

to watch the forbidden show (Scantlin & Jordan, 2006). As media technologies develop, blocking opportunities are no longer solely available through the “hardware” of the television set itself. Cable and satellite companies now offer parents the choice of setting program options that prohibit channels or programs from being available in the home (and thus avoiding the difficulty of having to program V-chips on multiple TV sets).

The Broadcast Decency Enforcement Act

The V-chip mandate and program ratings would seem to have shown tangible evidence that broadcasters were providing parents with the tools and technology they would need to protect children from age-inappropriate programming. Though many advocates and researchers argued that these were not being taken up by parents, policymakers felt that they had addressed their constituents’ concerns with a “least restrictive” policy. The broadcasters’ arguments that they were protecting the child audience began to fall apart, however, with several high-profile incidents of indecency mistakenly broadcast on major network programs viewed by adults and children alike. In 2003, during a live broadcast of the *Golden Globe Awards*, the lead singer of the band U2 thanked the presenters for his award and exclaimed “This is really, really fucking brilliant” (*USA Today*, 2004). Several months later, again during a live awards show, Nicole Richie accepting an award for her reality program *A Simple Life* said: “Have you ever tried to get dog shit out of a Prada purse? It isn’t so fucking simple” (Mears, 2009). Finally, in the most widely known incident of “indecency” in the United States, a 2004 Super Bowl halftime show featuring Justin Timberlake and Janet Jackson briefly showed Jackson’s breast after Timberlake mistakenly ripped off her

bodice in what producers called a “wardrobe malfunction” (Belmas, Love, & Foy, 2007).

After receiving complaints, the Federal Communications Commission cited and in some cases fined the broadcasters for indecency. Indecent language has always been banned from the public airwaves. Indeed the Supreme Court has, on several occasions, revisited whether the FCC should fine broadcasters for airing indecent content, including the landmark *FCC v. Pacifica Foundation* ruling. In this ruling, the court ruled that the agency *should* fine broadcasters as the unique qualities of the broadcast media justified the “special treatment of indecent broadcasting” (1978, p. 750 as cited in Levesque, 2007). In this case, the FCC cited a fine to a New York-based radio station for airing George Carlin’s monologue about the seven dirty words you can never say on the radio or TV. More recently, ABC, CBS, NBC, and Fox appealed FCC fines, and won a lower court ruling which cited the Commission’s policy as “arbitrary and capricious” (Mears, 2009). The FCC appealed to the Supreme Court, seeking restoration of its power to regulate indecency. It won its case.

One area of consternation in FCC indecency citations, which George Carlin explored in his “seven dirty words” monologue, is the loose definition of indecent language. The FCC defines indecency as “language or material that, in context, depicts or describes, in terms patently offensive as measured by contemporary community standards for the broadcast medium, sexual or excretory organs or activities” (FCC Consumer Facts at www.fcc.gov). In the case of Bono’s language, for example, it is not obvious that the F-word is a sexual reference; indeed, it seems more an adjective of emphasis. The court, however, agreed that the use of the F-word is “indecent”, with Justice Scalia writing, “Even when used as an expletive, the F-word’s power to insult and offend derives from its sexual meaning” (Mears, 2009). And in the case of non-scripted live programs, the court agreed that it should retain the power to fine isolated instances of profanity known as “fleeting expletives.” Some broadcasters now rely on a five second delay to avoid accidentally airing profanity (Eggerton, 2006).

Such programming mishaps would not be caught by either ratings or the V-chip. Sports events like the Super Bowl are not rated under the industry’s system (nor are news programs). And the ratings on unscripted live awards programs will not be rated as containing offensive language if the producer is not expecting it. Moreover, during this period, many broadcasters were beginning to “push the envelope” of what would be allowable on broadcast TV. Thus, Congress again felt compelled to act. They viewed the FCC fine of \$32,500 as an ineffective deterrent, and drew up legislation that would increase fines tenfold and would allow the FCC to fine for each act of indecency. The Broadcast Decency Enforcement Act, signed by George W. Bush in 2005, gives the FCC the authority to fine stations up to \$325,000 for each act of indecent content that airs between the hours of 6:00 a.m. and 10:00 p.m. This means that any given network may be subject to fines in excess of one million dollars (since fines are imposed on the stations that air the programming, and networks own the stations). It also means that networks are more likely to fight the fines. In July

2010, a federal appeals court struck down the FCC's policy barring "fleeting expletives" like Bono's and Richie's (see above) (Wyatt, 2010). The decision, which has been appealed to the Supreme Court, said such a policy violates the First Amendment because it is vague and could inhibit free speech. The FCC has appealed the decision, arguing that the court's decision threatened to have a "wide-ranging adverse impact" on the agency's ability to prevent indecent material from being broadcast. Indeed, broadcasters' challenges to FCC indecency fines have effectively brought the FCC's enforcement efforts to a halt (Schatz, 2010).

The Communications Decency Act

Concern over children's access to Internet pornography – whether intentional or accidental – led many groups to support legislation that would restrict pornography online. The Communications Decency Act of 1996, introduced as part of the Telecommunications Bill, made it illegal to knowingly transmit obscene or indecent messages to any recipient under 18 years of age. It also made it unlawful to send or display patently offensive messages in a manner that is available to a person that is under 18. The CDA was immediately challenged as unconstitutional. Opponents argued that it infringed upon the rights of adults to access legal content. Moreover, they argued, there are less restrictive means of protecting children from accessing such content, including the implementation of blocking technology, without prohibiting adults' access. The courts agreed, noting the absence of a tradition of government supervision over the Internet, and the fact that the medium was not as invasive or subject to accidental exposure to unwanted material as is broadcast (Levesque, 2007, p. 177).

The CDA was unanimously struck down by the Supreme Court, though the law prohibiting child pornography remains in effect. The law has taken an interesting twist recently, since some prosecutors have argued that the adolescent practice of "sexting" violates the CDA provision. Adolescents who take pictures of themselves or other adolescents and share them via cell phone or post them on the Web are open to criminal charges, including felony child pornography charges and being listed on a sex offender registry for decades to come. A 2009 study from the Pew Research Center's Internet and American Life Project found that 4% of cell-owning teens aged 12 to 17 say they have sent sexually suggestive nude or nearly nude images or videos of themselves to someone else via text messaging; 15% say they have received such images of someone they know via text message (Lenhart, 2009). While there is a growing consensus that such laws may be "too blunt an instrument to deal with an adolescent cyber culture in which all kinds of sexual pictures circulate" (Lewin, 2010, p. A1), there is a recognition that the circulation of images – even among youth – may have dangerous implications that we do not yet understand.

The Children's Online Privacy Protection Act

The 1998 Children's Online Privacy Protection Act (COPPA) was the result of the efforts of advocacy groups, including the Center for Media Education, that were alarmed by the extent to which websites had been collecting information about their child users (Ciochetti, 2007). COPPA is chiefly concerned with privacy and security risks that are created when children under 13 years of age are online, and requires that parental permission is sought before collecting or using information from children under 13. Enforced by the Federal Trade Commission, websites can be fined for not complying with the COPPA. The law is intended to prevent marketers from using kids' sites to get family information. Website operators must post clear and comprehensive privacy policies on their websites describing their practices for children's personal information. The rule does not apply to Internet users who are aged 13 or older. A social networking site like MySpace asks users to verify their age before they can join by putting in their birth date. Unfortunately, such obstacles are easily circumvented by children, who can calculate an "old enough" birth year on the registration page but post their real age on their home page.

Federal Funding Programs

The US government's influence on the content of children's media goes beyond regulatory statutes. To fully understand the landscape of children's media one must also examine ways in which federal funding impacts children's access to new technology and the availability of educational content.

In the early days of the Internet, when most homes had access via a desktop computer and a dial-up modem connection, concern arose over a growing "digital divide." Families without access to the Internet were disproportionately low-income and from ethnic or racial minority backgrounds (Fox, 2005; Hoffman & Novak, 2000). Observers worried that a technology gap would lead to a knowledge gap, an education gap, and an earnings gap (Devaraj & Kohli, 2003; Livingstone & Helsper, 2007). Indeed, research had shown that children with home computers and Internet access performed better in school and in tests of reading and writing than their peers without computers (Jackson et al., 2006).

The Schools and Libraries Universal Service Support Mechanism, commonly known as E-Rate, was authorized as part of the Telecommunications Act of 1996 (section 234) and championed by then Vice President Al Gore as a way of equalizing access to the Internet and enhancing telecommunications services. Administered by the FCC, applying schools or libraries would receive a discount ranging from 20% to 90% depending on the percentage of students eligible for free or reduced school

lunch. Importantly, the program provides only connectivity. Applicants must provide additional resources including end-user equipment, such as computers, software, and professional development (www.universalservice.org/sl/about/overview-program.aspx).

By many standards, the E-Rate program has been successful. In the period since its inception, the digital divide in America's schools has been considerably reduced, with more than 90% of all schools now reporting that they are connected to the Internet (Jayakar & Park, 2009). In spite of E-Rate, however, there remains a gap in Internet accessibility. According to the National Center for Educational Statistics, 97% of classrooms in town schools have Internet access whereas only 90% of classrooms in city schools do. This has led some to question whether the funds have gone to the neediest schools. Observers note that the complex and multistage application process which is time-consuming and labor intensive may prevent some schools from applying, particularly if they lack technical expertise and administrative support (Hudson, 2004). Others argue more advantaged schools take advantage of the program by applying for grants that supplement already state-of-the-art computer technology, a practice known as "gold-plating."

In February, 2010, a bill known as "E-Rate 2.0" was introduced to expand and extend the program beyond the initial cap of \$2.25 billion and to streamline the application process (H.R. 4619 from the Energy and Commerce Communications, Technology and the Internet Subcommittee). Key in the proposed legislation is funding for broadband equipment, which has yet to reach many hard-to-access students in rural communities, and a streamlining of the application process. As the divide in digital access begins to close, scholars have begun to observe difference in how new technologies are used. While in the United States, public policy has largely focused on physical access (but not broadband access), other governments, such as Canada's, have included the promotion of digital literacy and the development of cultural content online (Howard, Busch, & Sheets, 2010). Children who have more opportunity to explore computers and the Internet in informal settings like the home may develop distinct ways of approaching the technology.

The E-Rate program had an effect on another federal initiative: The Children's Internet Protection Act (CIPA). CIPA requires schools and libraries to install blocking software on their computers to protect children from age-inappropriate content such as pornography. The American Library Association and others have complained that blocking technology filters are too crude, and block educational content along with offensive content. They also argue that the filters block adult access to legal content. Despite these arguments, CIPA remains in place, primarily because the federal funds that go into the E-Rate program are contingent on schools and libraries installing filters which, they point out, can be turned on or off depending on the user.

Government funding also shapes the landscape of children's educational programming. As mentioned earlier in the chapter, the Children's Television Act of 1990 (and the subsequent processing guideline commonly referred to as the Three-Hour Rule) mandates that broadcasters provide educational programming specifically designed

for the child audience. Beyond this, public broadcasting stations in the United States are mandated to serve children's educational needs. The core institution of public broadcasting is the local station, and virtually all US television viewers have access to at least one public television signal (Aufderheide, 1996). The stations are independent, and many are powerful program-producing stations. Funds for these stations come from multiple sources, including viewers and corporate sponsors. Funds also come through the Corporation for Public Broadcasting (CPB), a nongovernment entity with a politically appointed and balanced (along partisan lines) board, funded solely by federal tax dollars. While CPB does not distribute children's programs, it does fund their production. Funding is also allocated at the federal level through agencies that serve "priority" areas. Since 2000, for example, The Department of Education's Ready To Learn Television initiative invested close to two billion dollars in children's educational programming (www.ed.gov/programs/rtltv/index.html). Ready To Learn is an initiative that supports the development of educational media for preschool and early elementary school age children and their families – primarily in the area of literacy. Some of the programs that have emerged as a result of Ready To Learn include *Between the Lions*, *Super Why!* and the *New Electric Company*. The National Science Foundation has also been active in funding media production – as informal science education – with the goal of increasing students' interest and skills related to science, technology, engineering, and mathematics. Their STEM grants of tens of millions of dollars have funded productions including *Fetch! With Ruff Ruffman*, *Peep and the Big Wide World* and *DragonflyTV*.

Self-Regulation

Media and advertising industries are protective of their free-speech rights under the First Amendment, but they are also sensitive to shifts in public opinion that may increase the likelihood of greater regulation. Often, they will seek to preempt policy initiatives by implementing a voluntary set of guidelines for members. Perhaps nowhere is self-regulation more evident than in the voluntary ratings that medi makers provide for their products. Movies, television, video and computer games, and music, each provide an indication of the content and/or age appropriateness of their titles. Industry-rating efforts have virtually always followed episodes of heightened public concern, with government threatening to take action if the industry does not. Movie ratings came first, in 1968, after dramatic social upheavals, including the sexual revolution, Vietnam War protests, and assassinations of US public figures. These events led policymakers and the larger public to scrutinize the contribution of media to the problems of the culture (Strasburger, Wilson, & Jordan, 2009).

During the 1980s, the Parents Music Resource Center admonished the music industry for its increasingly violent, sexual and misogynistic lyrics. The group, made up primarily of wives of prominent Washington lawmakers led by Tipper Gore,

argued that such lyrics had negative effects on the psychological well-being of listeners (Gore, 1987). After a series of Senate hearings and an extensive public debate, which weighed the well-being of children against the free-speech rights of musicians, the Recording Industry Association of America agreed to ask its members to participate voluntarily in a system of labeling their recordings and offering less explicit versions of lyrics alongside the original version. Today the Parental Advisory Label system (sometimes referred to as the "Tipper Sticker") alerts parents with a warning label, voluntarily placed on recordings by producers and distributors.

Each medium has handled the application of ratings differently, however, with television and music producers determining ratings and film and video and computer game titles submitting to an independent but industry-funded board. This has resulted in what one scholar has termed an "alphabet soup" of ratings indicators (Greenberg, 2001). It has also led to some unevenness in how the ratings are applied to media content. In the case of television, for example, Signorielli found that while 8 out of 10 prime time network programs were labeled with an age-based rating (e.g., TV-14), fewer than 4 in 10 were also labeled with content-based ratings (e.g., V for violence or S for sex), despite the fact that they contained that content (Signorielli, 2005).

Another example of self-regulation can be found in the Children's Food and Beverage Advertising Initiative. This initiative was launched as the Federal Trade Commission and Federal Communications Commission were initiating reports concerning food marketing to children (Holt, Ippolito, Desroches, & Kelley, 2007). It represented a coalition of major food companies pledging to improve the nutritional quality of foods advertised to children, and laid out a series of efforts the companies would undertake with target dates and objectives. A 2009 evaluation of the effectiveness of the self-regulation by Kunkel and colleagues reveals that though the companies signing the pledges lived up to their promises, the pledges themselves were idiosyncratic. The authors of the report provide the following example: "Cocoa Puffs cereal meets all the applicable criteria specified by its parent corporation, General Mills, to qualify as a healthy product. It contains no more than 175 calories per serving, no trans fats, and no more than 12 grams of added sugar, among other criteria. If the same product was marketed by Kraft Foods, however, it would fall short of Kraft's guideline, which specifies that a healthy product contains no more than 25% total calories from added sugar. This means that Cocoa Puffs is considered a healthy product according to nutritional guidelines for cereals specified by General Mills, but it would not qualify as healthy according to the nutritional guidelines for cereals marketed by Kraft Foods" (Kunkel, McKinley, & Wright, 2009, p. 28).

An additional challenge to self-regulation – in all areas, not just in food marketing – is that it is not necessarily the case that all members of the industry will either participate or self-regulate. Though the television industry came up with a system for identifying age-inappropriate content by designating both age (e.g., TVY – appropriate for all children, TV-MA – appropriate for mature audiences only) and content (e.g., S – for sexual content, V – for violent content, etc.), many networks have chosen not to include content identifiers. Similarly, not all food marketers signed up for the Children's

Food and Beverage Advertising Initiative. More than one quarter of the food and beverage ads airing during children's programs come from companies that did not sign pledges, resulting in a landscape of "junk food marketing" that remained virtually unchanged by industry self-regulation (Kunkel et al., 2009). The hazards of self-regulation, then, include noncompliance (usually without repercussions) as well as the dubious nature of the industries with economic imperatives policing themselves.

Conclusion

From the evidence laid out in this chapter, it is clear that social science research can and should play a more prominent role in the making of effective media policy. First, communication researchers must highlight areas in need of funding for basic research. In some areas of effects research we seem to know plenty (for example, the effects of exposure to violent content). But rapid technological developments have led to enormous gaps in our understanding of, for example, how the use of social networking sites shapes identity formation among young adolescents. (See Chapter 31 for a summary of the fledgling research in this area.) What we know about the effects of media is tied up with the funding that goes toward studying the problem. Without externally funded, objective, rigorous research, we cannot hope to make policies that address the real issues of how today's youth use and are affected by the media they consume.

Second, it is critical that scientific research be used in both the formation and the evaluation of children's media policy. Politicians often rely on public opinion research to identify areas on which to focus their legislative efforts. This is an important first step, but as social scientists, human beings, and parents, we recognize that what we say and what we do are often two very different things. An example of this can be found in the research the Annenberg Public Policy Center conducted around the V-chip policy. Prior to the introduction of the V-chip, we surveyed 150 parents about their interest in using a device, built into their TV, that could block out program content they felt inappropriate for their child. 70% of those surveyed said they would be very interested in using such a device. One year later, after these same parents were provided with television sets that had the V-chip technology, we found that 70% had never even tried to employ the device (Jordan & Woodard, 2004). In this regulatory effort, and in others, empirical research could have informed not only what parents think, in the abstract, but also what parents do, in the real-life setting of the home.

Finally, it is important for scholars to be active in getting research into the forefront of debates about media policy. Decades of media violence effects research (and the testimonials of effects researchers) led policymakers to try to reduce children's exposure to violence. Similarly, research on the beneficial effects of educational content has led to funding for PBS programming on television and in new media platforms.

Moreover, the basis for limiting children's exposure to advertising content has been grounded in studies that demonstrate young children's weak understanding of the persuasive intent of advertising messages. There is great potential for communication research to inform children's media policy and national discourse about the role of the media in the life of the developing child. As Wartella has argued, "[W]e need to understand . . . what research questions we take up in our work, how we situate them within the national public and intellectual debates, and how we attempt to convey our work to the segment of the 'public arena' we believe we are addressing" (2002, p. 372).

ACKNOWLEDGEMENT

The author would like to thank Hannah M. Cope for her assistance with this chapter.

Changes and Continuities in the Media Effects Paradigm

Erica Scharrer

ABSTRACT

The field known as “media effects” has both changed and remained the same. Some means of inquiry and topics of study persist in their command of the attention of scholars in this area whereas others represent new directions. This chapter reviews the status of media use around the globe, then discusses both changes and continuities in the field over time. One major change is the shift toward “media psychology,” as reflected in the title of this volume. Finally, this introduction reveals the logic used in the organization of the volume and a chapter-by-chapter review of the topics covered within, thereby serving as a detailed roadmap for the reader.

Media Use Around the World

There has never been a more fascinating time to study the role of the media in the lives of people young and old. Individuals are faced with a dizzying array of choices and many media consumption levels are at an all-time high. In the United States, for instance, adult men and women are estimated to watch television about five hours per day whereas kids aged 8 to 18 watch about three-and-a-half hours per day, both figures reflecting an increase of about 30 minutes daily since the data were collected

10 years prior (Nielsen, 2010). Similarly, Eurodata TV Worldwide recorded an increase in television viewing of 28 minutes per day between 1995 and 2005 among the 30 countries from which it gathers data, setting an average daily exposure time across those countries at three hours and four minutes. Throughout the world, newer forms of media compete and coexist with old, resulting in a myriad of devices, platforms, and gadgets to be used for purposes including entertainment, information acquisition, and communication. Media use begins in many cases even before birth, purporting to stimulate babies *in utero*, drawing the very young to screens at increasingly earlier stages, and continuing to appeal in various forms and functions throughout childhood, adolescence, and adulthood.

In some ways, the flourishing media landscape has created more options than ever for audience members and therefore the types of effects media engender continue to become more complex and important to study. This complexity and transformation can be illustrated easily within the medium of television, for instance, for which one is no longer at the mercy of the programming schedule, as time shifting through DVRs (with an estimated penetration of 37% of US homes, Nielsen, 2010) and calling up shows on Internet sites and “smartphones” (as approximately 20 million individuals in the US did in the first quarter of 2010, Nielsen, 2010) become more prevalent practices. The media-rich environment is also illustrated by the statistic that an estimated 79% of homes in the United States are wired for high-speed Internet (Nielsen, 2010), a boon to those who have this means of immediate access but a severe impediment to those who do not in a context in which institutions from banks to schools assume 24/7 connectivity (Jung, 2008; van Dijk, 2005). Although not as prevalent in time use as their screen-based counterparts, approximately 39% of US adults read a newspaper each day (spending an average of 26.4 minutes daily with it) and 29% a magazine (spending an average of 15.6 minutes; Nielsen, 2010). Radio still reaches an estimated 61% of all adults in the US per day (Nielsen, 2010) and remains the most global of media due to its affordability and nonreliance on literacy and electricity (Hendy, 2000; Manyozo, 2009). Videogames are both used more often by their most ardent fans and now have a wider demographic reach, accounting for an average of 1 hour and 13 minutes per day for young people (Rideout, Foehr, & Roberts, 2010) but are also used by 53% of all adults in the United States, with an only slightly greater prevalence in use among men compared to women (Lenhart, Jones, & Macgill, 2008). Children in the United States are raised in home environments that contain, on average, 3.8 television sets, 2.8 playback devices such as DVD or VCRs, 1 digital video recorder, 2.2 CD players, 2.5 radios, 2 computers, and 2.3 video game systems (Rideout et al., 2010). Most if not all of these media forms feature increasing amounts and types of commercial content, resulting in a frenzy of ad messages that occupy a growing proportion of space and time in content that is both overt and readily distinguishable as advertising and increasingly embedded into programs and other more covert forms, as well.

Other nations boast similar figures and similarly media-rich environments. In the United Kingdom, for instance, individuals spent an average of 218 minutes watching television, 164 minutes listening to the radio, and 24 minutes on the Internet per day

in 2007 (Ofcom, 2008). A full 98% of those in Iceland are Internet users, as are 95% in Norway, 93% in Sweden, 90% in Greenland, 89% in the Netherlands, 88% in Bahrain, 86% in Denmark, 85% in Finland, New Zealand, and Luxembourg, 83% in the United Kingdom, 81% in South Korea, 80% in Australia, 79% in Germany, and 78% in Japan, Canada, and Belgium (Internet World Statistics, 2010). Residents of France, Germany, Norway, Italy, Canada, Japan, Poland, Spain, the Netherlands, Ireland, and the United Kingdom average between 154 and 268 minutes per day of television consumption (Ofcom, 2007). Among the 30 countries covered in the Eurodata TV Worldwide data, Japan had the highest level of television use per day at 4 hours and 11 minutes. The average television use across Asian countries, in general, was 2 hours and 34 minutes, across Latin America 3 hours and 16 minutes, and in the Middle East 3 hours and 37 minutes in 2005 (Eurodata TV Worldwide, 2010). With additional media technologies commanding attention alongside television and the Internet, media consumption occupies increasingly larger amounts of individuals' time around the world. In Africa, for instance, mobile phone subscriptions have grown from less than 2% of the population in 2000 to 30% in 2007 (International Telecommunication Union, 2008) and Internet subscriptions rose from approximately 100,000 in 1998 to 800,000 in 2002 (Jensen, 2000; Wilson & Wong, 2003).

This medium-by-medium description does much to illustrate the point of a media-rich environment and daily exposure levels to singular media forms, but it does little to demonstrate the sheer complexity of studying media influence when uses of each of these media types are considered in the collective. Increasingly, children, adolescents, and adults spend time "multitasking" with media – attending to multiple media forms simultaneously – posing a considerable obstacle to researchers whose goal is to discover how individuals respond to it all (Rideout et al., 2010). The field of media effects, therefore, is presented with both the challenge and the opportunity to sort out these complex and potentially idiosyncratic experiences in a context in which the number of media outlets has proliferated, their use occurs at virtually any location and time of day, and their consumption and purposes intersect and converge more than ever before.

Why are individuals drawn to media to such impressive degrees? How do they process and make meaning from media messages? What types of content are they both receiving and creating when spending time with media? What are the consequences of such media use? What factors and conditions help explain why individuals vary in their responses to media? And what factors and conditions may moderate or mediate such responses? Media effects research has long taken up these critically important questions. The answers provided in a large and still growing body of knowledge have crucial implications for day-to-day interactions, for public policy, and for society, at large.

Media Effects Scholarship: Stability and Change

Just as the media landscape has both changed and remained the same, media effects scholarship has taken a parallel course. Scholars continue to explore issues in

traditional areas of inquiry such as media violence, political communication, and children and media, responding to the changing media landscape in each. These areas are well represented in the current volume as they are in the literature, and in the effects paradigm at large, and they each include perennially important questions with new twists. For example, what are the effects of consuming media that feature violent content? Television and film have long been studied in an attempt to answer that ever-important question, but video and computer games are relatively new forms that demand (and increasingly command, as we will see in this volume) scholarly attention. What role do the media play in electoral politics, and how do individuals respond to (learn from, be inspired by, be discouraged by, be angered by, accept, question, etc.) political ads, news coverage of campaigns, and other political media content? In this case, important studies of uses of and responses to more traditional media forms persist. Yet, newer media have led to an increasingly fragmented array of outlets for individuals to attend to that correspond or contradict one's own political allegiances, as well as the potential for individuals to be not just media consumers but also media producers through such outlets as social media and blogs. What does the amount of time children spend with the media mean for their health and fitness, their performance in school, their knowledge of and requests for products advertised, their views of themselves and others, and their face-to-face communication with parties including parents and peers? Again, these questions have been the subjects of decades of scholarly work but have spurred newer topics to interrogate as levels of media use rise and popular media forms shift toward greater interactivity with technology.

Media effects scholars continue to use variations on tried and true research methods, including content analysis, experiments, and surveys. The latter two methods directly explore associations and causal connections between media use and particular outcomes, whereas the former – content analysis – is conducted in order to have a sense of what themes, patterns, and messages prevail in media, seen by many in the field as a necessary first step toward the exploration of effects (Riffe, Lacy, & Fico, 2005). Yet, once again, methodological approaches have had to evolve as well, such as new strategies to deal with the ephemeral nature of Internet content in content analysis, more lengthy and multi-faceted survey questions to accurately capture complex media-use patterns in survey research, and newer physiological means of studying individual responses used to supplement (or in some cases replace) paper-and-pencil outcome measures in the lab. Scholars have embraced more sophisticated statistical analyses (such as structural equation modeling and hierarchical linear modeling) and triangulation both within the quantitative tradition and beyond. The increasing speed of computer technology assists the modern media effects researcher greatly in exploring these processes through complex statistical procedures executed in seconds by a simple click of a button. Indeed, as the media effects field matures, many journals in the field are requiring scholars to supplement statistical tests of difference across groups (like analysis of variance) with measures of effects size in a concerted effort toward greater precision. As always, these statistical

results point to what is known about the phenomenon of study – such as that two variables are correlated within the sample, or that a host of predictor variables explains a certain amount of variance in an outcome variable. Yet, they also point to what is not known – such as the unexplained variance in an outcome variable or the multitude of reasons why groups may differ from one another on an opinion item in a survey or a dependent measure in an experiment. The goal of effects researchers is, of course, to minimize the unknown by making sound contributions to the scholarly literature that both replicate past discoveries and extend areas in new directions as well as to periodically assess the state of the body of knowledge on a topic as a whole. This volume will do both, identifying important individual scholarly inquiries and synthesizing them to form conclusions about what we can say that we know about a topic of study with some confidence and what questions remain unanswered in the field.

The form and the focus of media effects research have each become more sophisticated and thereby increasingly able to acknowledge and ascertain the complex processes through which individuals attend to, comprehend, and respond to media. The increased focus on cognition that occurred in the field of psychology (Robins, Gosling, & Craik, 1999) has helped shape recent directions in media effects, as well, with heightened attention to brain mapping, neuroscience, and other ways of examining processing of and physiological responses to media. For instance, media effects researchers have used fMRI technology to study how children attend to and comprehend television content (Anderson, Fite, Petrovich, & Hirsch, 2006) as well as how young people's brains are activated by exposure to media violence (as we will see in this volume; Murray et al., 2006; Weber, Ritterfeld, & Mathiak, 2006).

At the same time, there has been amplified attention to affective processes, as well, through more consideration of the role of emotion in individuals' interactions with the world around them. The literature in this area has grown sufficiently to warrant an edited collection, *The Routledge Handbook of Emotions and Mass Media* (Doveling, von Scheve, & Konijn, 2010), with entries on such topics as the role of emotion in both the processing and the enjoyment of media content, fear responses to media, and emotional responses to visuals. If media effects research has traditionally emphasized *behavioral* outcomes, the recent trend is to supplement that emphasis with affective and cognitive outcomes, as well, and to attempt to understand the links among thoughts, emotions, and actions.

Finally, across the spectrum of cognitions, emotions, attitudes, behavior, and physiological responses, studies of media effects have included a growing number of variables and have examined direct as well as indirect relationships among them, thereby augmenting both the richness and the complexity of their conclusions. We have determined, for instance, that although some outcomes may stem directly from exposure to media (like playing a violent videogame triggering aggressive cognitions), others may travel only through intermediary conditions or steps (like use of television contributing to a view within adolescents that many of their peers consume alcohol and that view of their peers, in turn, predicting adolescents' own use of alcohol).

The Emergence of “Media Psychology”

Within this shifting backdrop, the current volume brings emerging and established scholars together to provide a thorough and comprehensive account of recent and enduring foci in scholarship in the rich and ever-relevant fields of media effects and media psychology. A large number of socially significant contributions to this body of knowledge continue to be produced under the traditional name for this paradigm, “media effects.” This research includes systematic analyses of media content (again, often as a necessary first step toward linking with attending consequences of exposure to such content), opinions, orientations toward and uses of media, media influence on thoughts, attitudes, emotions and behavior, and interventions thereof. This extensive and continually evolving body of knowledge is assembled, reviewed, and extended here.

Yet, as the title of this volume implies, the field has shifted in nature, as well, increasingly embracing and exploring a view of the individual’s capacities in processing media content, making sense of media texts as a precursor to or in lieu of an emotional or behavioral response. The term “effects” seems less relevant to this newer thread of research, as the consequences of exposure to media are less the focus than the response that is triggered by encountering media texts. Within some forms of media psychology, the emphasis is less often on what media may do to individuals (such as influencing what they think or know about a topic, affecting their attitudes or feelings, or encouraging or discouraging particular behaviors) and more often on how individuals make sense of media texts, using cognitive capacities to process them, affective routes to respond, and registering physiological change. To cite just one of many possible examples to illustrate this point, the work of L. J. Shrum (2002, 2007) has provided a processing explanation for the cultivation effect by showing that cognitive tendencies toward drawing on accessible and available sources of information can produce differential outlooks between heavy and light television viewers. Thus, the term “media psychology,” understood broadly as the intersection between media studies and the discipline of psychology with its attendant interest in the study of individuals and their mental functions as well as neurobiological processes that guide social behavior, is increasingly apropos.

By all means and measures, work that bridges communication and psychology is growing. Media psychology is a vibrant division in the American Psychology Association. It is the sole focus in academic journals such as *Media Psychology* from Taylor & Francis and *American Journal of Media Psychology* from Marquette Journals. Its emergence as an important scholarly focus only strengthens and sharpens the research done in the area of effects, which has its own set of journals that tend to devote it space, including *Communication Research*, *Journal of Broadcasting and Electronic Media*, *Mass Communication and Society*, and others. Moreover many scholars publish in both and reference both, thereby illustrating their intersection. This volume of

the Encyclopedia, therefore, is titled *Media Effects/Media Psychology*, reflecting both the established and the emerging nomenclature, and providing a state-of-the-art review of this vital and generative field.

Distinguishing Characteristics of the Volume

In addition to cultivating the fertile ground at the intersections of media effects and media psychology, there are a number of additional features of the current volume that make it distinctive. It is written by scholars whose locations span six countries of residence. Indeed, it is international in both author affiliation and in scope – with authors from Belgium, Canada, Germany, Israel, the Netherlands, and the United States and studying global regions including Europe, the Middle East, and North America. Chapter authors were asked to reserve a central place for their own scholarship within their review, and therefore rather than a traditional literature review, there is a synthesis of the author(s)' own contributions to the topic area and the corresponding literatures.

It features topics one would rightly expect in any volume of its sort because of their continuing standing in the field, including lengthy treatments of subjects within the realm of media and politics, reviews of prominent theories of media influence, and explorations of the literature regarding effects on such phenomena as stereotyping and aggression, and stemming from such content as advertising and communication campaigns. In many of these cases, however, in order to provide a fresh perspective on these long-standing topics, an author with a unique view on the topic has written the chapter. The resulting, innovative takes on traditional subjects seen, for instance, in the chapters on cultivation theory and on fear- and anxiety-provoking responses to media, set this volume apart from others.

The volume also includes more novel and innovative foci in an effort to reflect newer directions in this dynamic field. For example, volume chapters explore news representations of war and their consequences for audiences, physiological responses to media exposure, exploration of enjoyment as a media effect, and theories not just about media influence but about individuals' perceptions of media influence. Compared to similar volumes it also gives particularly strong weight to the topic of violence – justified by the enduring controversies and concerns in this area – and to the child audience. In fact, this volume devotes an entire section to media effects on children and adolescents, groups that have long been considered particularly vulnerable due to their cognitive development and limited life experiences but that also have been viewed as active agents in media use within the media effects paradigm (Comstock & Scharrer, 2007; Strasburger & Wilson, 2002). Finally, a unique aspect of this volume is its emphasis in the latter chapters on mediating or moderating media effects (primarily on children) through such practices as parental interactions around media (including rule making and verbal responses to content), media literacy, and policy making in the arena

of children's programming. In closing the volume in this fashion, an activist, applied interpretation of the field is encouraged, providing the reader with what the research evidence suggests about both micro- (parental mediation, media literacy) and macro-level (through public policy and governmental involvement) ways to intervene effectively in unwanted media effects and to promote positive interactions with media.

Overview of Organizing Scheme

Providing a state-of-the-art review of this vast and rapidly changing field is a demanding task. This volume aims to represent the contemporary state of media effects and media psychology insofar as it is possible to illustrate major traditions as well as dynamically innovative elements. The wide-ranging span of the field requires an equally complex organizational scheme for a volume of this type. Thus, the book is organized into three parts, each with its own sections. The sections have multiple chapters contained within.

The first part, "Theories and Processes/Processing," brings together a review of some of the most prevalent and generative theories in the field (the "Theories and Processes" component) and the latest literatures on "Processing," roughly defined as the ways that individuals make sense of or make meaning from media. What these two areas – theories and processes and processing – have in common is that they both answer the question of how and why media effects occur. Within this part, therefore, chapters on traditional theories in media effects in Section I are presented alongside scholarly explorations in Section II of "internal mechanisms," meaning processes that primarily occur within the individual – including cognition stimulated by media content, motivations for seeking out media, theoretical propositions about enjoyment, and physiological responses in the brain during media exposure – that help explain orientations toward and responses to media.

The second part, "Evidence of Effects," organizes and synthesizes the vast literatures on both newly emerging and long-lasting areas of inquiry in the study of media impact. It is divided into sections assessing effects "On Views of Self, Others, and Events," "On Personal Health and Social Well-Being," "In the Political Arena," and "On/Of Persuasion," with each section bringing together related literatures. The section labeled "On Views of Self and Others" (Section III) is concerned with ways that media shape knowledge of, attitudes about, and feelings toward the self, others, and major global events. In doing so, the section begins with media effects on socialization (the process of learning about the culture and one's roles within) and includes the development and manifestation of stereotypes. It ends with influence of media on perceptions of events covered in the news, particularly war and conflict (the "views of events" component), a critically important topic with implications for foreign policy and public opinion. Section IV, "On Personal Health and Social Well-Being," has to do with such health- and well-being-related outcomes as body image, obesity, fear, anxiety, aggression, and sexual behavior. These effects, therefore, are

variously intra- and/or interpersonal in nature, revealing themselves in both individual cognition and affect and social interactions and behavior. Section V, "In the Political Arena," brings together media effects related literature about political ads, political entertainment (exemplified by such programs as *The Daily Show with Jon Stewart* or in monologues of late-night show hosts), and news coverage of politics in the age of digital media and such outcomes as political knowledge, support of policies or politicians, voting and other forms of civic participation. The section, therefore, implicates campaigning, governing, and participating in the electoral process as well as in other aspect of civic life. The final section in this part, Section VI, "On/Of Persuasion," illuminates connections across persuasive media attempts including advertising for products and services and public communication campaigns, with the latter including such constitutive elements as social marketing and public service announcements. The communicative strategies of persuasion are thus studied in this section, whether for the purpose of public health or corporate profit.

Finally, the third part of the book is titled "The Young Audience," and it closely examines the unique circumstances that arise when media are being consumed (and sometimes produced) by children and adolescents as well as the corresponding challenges and opportunities for parenting, teaching, and policy-making. Of course, media effects research is intimately connected with audiences, and this final part of the book reflects the particular ways that children and teen audience members have of interacting with media – such as through educational programming among the very young or via social networking sites or mobile phones among adolescents – as well as the consequences of these media uses. Thus, Section VII, "Media Use and Effects on Learning and Development," discusses ways in which media can be intentionally educational (such as through educational and/or "prosocial" programming that encourages social and emotional growth) as well as ways media can unintentionally interfere with skills necessary for educational achievement. Because learning is not limited to formal education, *per se*, the section also focuses on the Internet's role in key aspects of adolescents' development, including their communication with others and their expression of identity. The final section, Section VIII, "Mediating and Mitigating Effects," examines the ways in which various parties can intervene in media effects: teachers and members of community organizations through media literacy, parents and caregivers through parental mediation, and the government and other policymaking entities through laws and guidelines for children's media.

Introductions to the Chapters

The first section of Part 1, "Theories and Processes/Processing," entitled "Theories of/about Effects," devotes chapter-length treatments to some of the most important and lasting theories in the field. Many of the theories have to do with why and how and under what circumstances individuals are influenced by media, and these are the theories of effects. Yet, the section also includes a chapter on theories and concepts

pertaining to how individuals perceive the media and how they perceive media influence on themselves and others. This aspect of the section is therefore the theories *about* effects.

Maxwell McCombs and his co-author Jae Kook Lee have the lead chapter in this section, Chapter 1, in which they detail the evolution of one of the field's most prominent theories of media effects, agenda setting. The chapter discusses how the news media can make issues, events, and characteristics of public figures more salient, both intentionally and not, and it identifies factors that make agenda-setting effects more or less likely to occur. McCombs and Lee also provide an explanation for how such effects occur through such concepts as knowledge activation and affective response.

In Chapter 2, Jan van den Bulck takes a novel approach, emphasizing the sociological, in his treatment of another long-standing and central focus in the field, cultivation theory. Van den Bulck draws heavily on early publications explaining and testing the theory in his explanation of cultivation as an exceptional theory of media effects, different from other theories, for example, in the use of micro-level data (from content analysis and surveys) to make broad-based inquiries into power structures in society. The degree of activity of the viewer and the range of possible meanings to be made from television texts is discussed for its implications for the theory in the chapter, as is the turn toward greater attention to cognitive processes in social science.

In Chapter 3, framing and priming theories are reviewed by political communication scholars (and brothers) Bertram T. Scheufele and Dietram A. Scheufele, who introduce a multi-level matrix to identify factors operating at the micro- (effects on individuals), meso- (effects on organizations), and macro-level (effects on public discourse or politics at large). In doing so, the authors provide a pioneering synthetic treatment of these two interrelated and long-standing theories and discuss the implications of these processes in politics as well as other contexts.

The general aggression model (GAM), a model built from a resourceful assemblage of prior theories and concepts used to explain how and why individuals may learn aggression from exposure to violent media, is discussed by Christopher P. Barlett and Craig A. Anderson in Chapter 4. The authors also introduce and explain the general learning model, a broader extension of the GAM that encompasses other media effects aside from aggression that are learned from nonviolent media use. For each of these models, Barlett and Anderson discuss both short- and long-term effects and individual difference variables that identify who among audience members is more or less likely to experience an effect.

Finally, Chapter 5, written by Yariv Tsfati and Jonathan Cohen, finds conceptual similarities among theories and models pertaining to perceptions of media effects that have largely been considered one by one rather than in conjunction with one another in past research. Opinions regarding the credibility of news media, views of media as "hostile" when they're perceived as insufficiently supportive of one's own position on an issue or topic, and the tendency to perceive others as more susceptible

to negative media influence than the self are the perceptual threads that Tsfat and Cohen weave together in this ground-breaking chapter. The first section of Part 1, then, both discusses enduring and evolving single theories (like cultivation and agenda setting) and introduces new meta-theoretical principles through the art of synthesis. It also encompasses theoretical propositions and the resulting empirical support for explanations of media effects themselves and of perceptions of media effects.

The second section of Part 1 is titled "Internal Mechanisms: Enjoyment, Appeal, and Physiological Response," and, again, is defined by forces and tendencies within individuals that shape their interactions with media. The antecedent question of why individuals are drawn to particular media is addressed here, as are explanations for why we find media so enjoyable and appealing. The section also encompasses the biomedical and physiological processes that are triggered in the human body and mind when encountering media messages of particular types. Thus, the emphasis is largely (but not wholly, as, of course, the psychological is intertwined with the social and cultural) internal, dealing with psychological motivations, cognitive processing, and systems activated within the individual.

The section is led by an entry on the uses and gratifications tradition by Paul Haridakis in Chapter 6, in which he points toward a number of new directions within the paradigm, including a more thorough examination of motives for seeking particular media exposures and a wider view of degree of audience activity as a variable rather than a taken-for-granted condition. Throughout the chapter, Haridakis demonstrates how uses and gratifications should not be positioned in opposition to media effects but rather as a complementary component. Why individuals seek out particular media to interact with plays a substantial role in how they respond within those media interactions.

Entertainment theory is reviewed and discussed by Tilo Hartmann in Chapter 7, assembling research findings and corresponding concepts regarding why individuals enjoy spending time with media. Adaptive tendencies within humans, Hartmann shows, help explain needs for both recreation and psychological growth, and media provide safe and supportive challenges to our thoughts, emotions, and behaviors.

In Chapter 8, the concept of selective exposure and the particular allure of violent media are addressed by Marina Krcmar. She discusses the use of violent media to manage or adjust moods, to undergo the thrill of "excitation," and to experience connections with characters. The role of personality traits is also thoroughly considered and the attending research regarding what characteristics make individuals more or less likely to be attracted to violent media is reviewed.

Chapter 9 and Chapter 10 then turn more decidedly to the topic of cognitive processing and physiological response, first in Annie Lang's chapter and then in John P. Murray's piece in which neuroscience findings in the topic of media violence are presented alongside more traditional forms of inquiry. In Chapter 9, Lang presents a multi-faceted model using a nesting structure to explain the processes that ensue when an individual encounters a stimulus (which can include both media and

interpersonal inputs). The cognitive system is the smallest of the concentric circles, followed by the motivational system, then the biological system, next the social system and, finally, the cultural system. Lang's chapter focuses on the first few layers, and she demonstrates how rather than change- or no change-defining media effects, interactions with media can best be seen as continuously dynamic responses within and between these systems.

In Chapter 10, Murray views the shift within media effects/media psychology toward the greater use of brain mapping and fMRI technology through the lens of the violence literature. Murray begins with a detailed history of the research- and policy-related concerns of media violence (including the government-led inquiries into the effects of violence) and then traces the literature through the very recent reliance on neurological investigations of audience responses. Changes revealed through cutting-edge research using brain mapping within the prefrontal cortex bring the literature on violence effects full circle. The theme of the section as a whole, therefore, is an exploration of the mechanisms within individuals that trigger, shape, and explain their particular orientations toward and responses to media.

Part 2 of the book, "Evidence of Effects," is divided into sections assessing effects in particular realms, and in doing so, it foregrounds the evidence for psychological, social, and political effects themselves more so than the mechanisms by which those effects transpire, as was the case in the prior part. Here, the large and expansive literatures on media effects in a number of aspects of social life are reviewed and synthesized, organized into cohesive subtopics that represent enduring foci.

The first, Section III, titled "On Views of Self, Others and Events," begins with a chapter by Nancy Signorielli on media messages about gender and their influence on the individual, Chapter 11. Signorielli illustrates the power of television to act as an agent of gender-role socialization, first documenting the patterns of content regarding television's treatment of gender that persist in the twenty-first century and then reviewing the empirical evidence for the ways in which viewing those depictions can shape individuals' views of what is acceptable or ideal for men and for women in contemporary society. In the chapter, the interwoven aspects of identity – not just gender but also age and race and social class as seen through occupations – is readily apparent as the case for lasting media effects is made.

In Chapter 12, Travis L. Dixon and Christopher S. Josey review the evidence on the treatment of race in news coverage of crime and the ways that audience members' views are shaped by such treatment. Dixon and Josey also use content analysis findings as a starting place to establish racial biases in news, and they proceed to empirical evidence of the effects of such representations, including studies conducted within the cultivation tradition and those stemming from a priming paradigm in which such concepts as cognitive accessibility play a central role. In the chapter, the effects research on both traditional news and the still nascent area of online news are critically reviewed.

In Chapter 13, Dana Mastro and Riva Tukachinsky also explore the impact of race and ethnicity in the media, concentrating their efforts on entertainment media

content more so than news. They review the relevant content patterns in media and then provide a detailed explanation of stereotype construction and schema formation. As other authors in this section have done, Mastro and Tukachinsky review findings framed by cultivation theory, social cognitive theory, and priming, yet they also include social identity theory in their review and give careful attention to factors that may intervene in a media effect on stereotypes. The chapter encompasses such outcomes as influence of media stereotypes on opinion formation on policies, on non-dominant group members' views of themselves, and on dominant group members' views of non-dominant "others."

Finally in this section, in Chapter 14, Michel M. Haigh reviews the content and effects research pertaining to a topic not always covered in media effects books but one that is of immense social significance, the impact of news coverage of war on individuals' attitudes and opinions. Like in the Travis and Dixon chapter, Haigh places news media as a matter of central concern, yet the latter part of the chapter also reveals the effects of less traditional and more hybrid media forms such as political entertainment and political blogs. Haigh incorporates both long-standing concerns regarding news coverage of war and more recent issues such as reporter "embedding" within military units. She also uses the content analysis research as an important step in determining how news media tend to cover war and conflict and then she draws from these patterns when reviewing the research evidence for effects on public opinion.

The section at large, therefore, makes apparent the potential for news and entertainment media to define how one considers, conceptualizes, and evaluates the self, others (including both particular social groups and "the enemy" in a situation of military conflict), and critical global events.

The second section, Section IV, of Part 2, "On Personal Health and Social Well-Being," turns the reader's attention to the health and well-being of the individual through such topics as body image and obesity or therapeutic effects of television viewing. Yet it also attends to one's social well-being as it takes shape within social interactions, be they aggressive or sexual in nature, or fear and anxiety provoking.

In Chapter 15, Kim Bissell combines two related literatures that are sometimes kept quite apart, the role of the media in weight-related health on both sides of the spectrum, overweight and underweight. First, Bissell reviews the key findings in the vast literature on the role of media in body image disturbances that range from body dissatisfaction to full-blown eating disorders, devoting considerable attention to additional factors that mitigate media influence and to the theoretical perspectives that inform these studies. She also discusses the phenomenon of "weight bias" (negative perceptions of those who are overweight) and the role of media in contributing to this stigma, as well as the literature regarding media use and a tendency toward being overweight or even obese. The final section of the chapter calls for greater integration of these elements in future studies that attempt to determine why and how media use can encourage underweight tendencies in some individuals and overweight in others.

In Chapter 16, Robin L. Nabi and her co-authors Jiyeon So and Theresa de los Santos examine the increasingly popular reality television genre for its potential for health effects. They begin by defining the elements that characterize the genre and then review the literature regarding the motives and gratifications behind its viewing. The bulk of the chapter, however, is concerned with effects and Nabi and colleagues review cultural studies contributions arguing for ideological messages within the genre as well as empirical studies of the effects of reality crime, dating programs, and personal makeover shows. They demonstrate the importance of such concepts as identification and involvement, perceived relationships with characters, and parasocial interaction in these processes and discuss the research evidence for both positive and negative implications for health-related outcomes.

Cynthia A. Hoffner and Elizabeth L. Cohen also cultivate fertile new conceptual ground in their chapter on fear, risk, and social anxiety and intergroup relations pertaining to media. In Chapter 17, Hoffner and Cohen begin by reviewing the immediate and lasting effects of media on fear, drawing from both entertainment and news media, with the latter topic extending into audience perceptions of risk and the implications of those perceptions for behavior. In what is perhaps most groundbreaking about their chapter, Hoffner and Cohen then extend the focus toward the fear and anxiety produced by and in “intergroup relations,” discussing the research evidence and theoretical perspectives regarding ways in which individuals can perceive others as posing a threat. In so doing, the chapter makes important connections to prior chapters in the volume regarding both stereotypes and perceptions of media influence on others.

Finally in this section, perhaps the two most enduring controversies and concerns about media effects, violence and sex, are taken up in the last two chapters. Since the advent of television and with film and radio before it, members of the public have expressed anxiety about the influence of sex and violence on children, Congressional inquiries have either threatened or actually brought about regulation (such as in the form of labels to accompany television programs), and researchers have conducted studies to document and explain effects.

In Chapter 18, Ron Leone and Angela Paradise review the findings regarding aggression and desensitization from violence, incorporating research evidence that answers two critical questions: can media encourage aggressive thoughts, attitudes, and behavior and can media use make individuals become habituated to violence, so that violent exposure no longer registers as a matter of concern? The evidence points decisively to an answer in the affirmative to both questions, and the Leone and Paradise chapter both shows how aggression and desensitization are related and also points to factors that make such outcomes more likely, including factors within the individual (like particular personality characteristics) and in the media content (including the inclusion of rewards or punishments for characters’ violent behavior).

In Chapter 19, Kirstie M. Farrar provides an accounting of the body of knowledge on effects of sex on television, emphasizing socialization processes, or the ways that individuals – especially adolescents – learn about sexuality. Farrar reviews the theo-

retical bases for the media's sexual socialization effects, including social cognitive theory and cultivation theory, and then organizes the empirical research record on effects according to influence on cognition (including expectations and perceptions of social norms), attitudes, and behavior. Antecedent and intervening variables are identified in the chapter, as well (such as the demographic characteristics of the viewer or the ways in which sexual activity is depicted in the media) and the chapter concludes with a discussion of the empirical evidence for positive effects of media on sex-related outcomes, such as on perceptions of the efficacy of condom use or attitudes about safe sex. On the whole, therefore, the section is organized around the concepts of health and well-being, including weight-related health concerns, fear and anxiety both personal and social in nature, aggression and desensitization, and attitudes toward, views of, and behaviors regarding sex. A unifying element is the relationships that individuals form, both with each other and with characters they encounter in the media.

The third section of Part 2, Section V, of the book, "In the Political Arena," provides a comprehensive view of the vast and highly developed subfield of political communication, with chapters covering the media's role in critical issues and outcomes pertaining to electoral politics and democratic participation. Rather than attempting to provide a comprehensive overview of media effects in this massive area, particular media forms are emphasized, including political commercials (since they are so central in political campaigns), debates (because they draw large audiences and media spectacle), blogs, websites and other Internet-based forms of political communication (because they represent a critical new means of communication), and political entertainment (because the research evidence suggests important effects can stem from even humorous or entertainment-based political content). Within these emphasized media forms, effects on knowledge of candidates and of policies and events, on attitudes and emotions including support or lack thereof, and on voting and other forms of both political and civic participation are discussed. The resulting conclusions are critical for democracy and relations between press, politics, and public in the twenty-first century.

William L. Benoit and Jayne R. Henson lead off this section with Chapter 20 on the central role of political advertisements and debates in the political realm. Benoit and Henson first argue persuasively for the continuing importance of these practices and then review their functions within campaigns and their most frequent topics, including descriptions of particular issue positions or policies and attacks on opponents. They then consider whether and why effects of these political media forms might be considered "minimal," and they end the chapter with a review of the evidence for effects of commercials and debates relying heavily on meta-analysis to point to the most reliable conclusions.

The next two chapters both examine the intersection of information and entertainment in contemporary media. In Chapter 21, Patricia Moy, Michael A. Xenos, and Muzammil M. Hussain first provide a broad and sweeping review of both traditional news and of "infotainment" and the role of each in individuals' participation

in democratic activities and civic participation. Moy, Xenos, and Hussain begin their chapter by defining activities and roles that fall within the concepts of civic participation, citizen engagement, and social capital and then they turn toward a discussion of the effects of news coverage of politics in newspapers, television and the Internet. They connect these more traditional outlets for political information to political comedy as seen in satirical news programs, late night shows, and sketch comedy, and then call for ways in which scholars can respond to the increasing fragmentation and stratification of audiences across an ever-widening array of outlooks. It is precisely the hybridity of genres (such as information/news and entertainment) and texts and audiences that R. Lance Holbert and Dannagal Goldthwaite Young take up in Chapter 22.

Holbert and Young advance a research agenda for future scholarship at the budding intersection of politics and entertainment. From sitcoms and dramas to “fake news” programs (like *The Daily Show with Jon Stewart*) and talk shows airing during the day (such as *Oprah*) or late at night (such as *The Tonight Show with Jay Leno*), political communication scholars are increasingly responding to a changing media environment in which individuals gain information and insights regarding politics from a number of sources. The authors study the composition of the audiences for these hybrid media forms and draw from more humanistic research traditions in arguing for how audiences actively make meaning across media texts, in understanding the conditions that pave the way for political entertainment, and in addressing the larger implications for policies including gay rights and the protection of the environment.

Finally, the critically important topic of the role of the Internet, which positions individuals not just as audience members but also as content producers, is discussed by Leticia Bode, Stephanie Edgerly, Ben Sayre, Emily K. Vraga, and Dhavan V. Shah in Chapter 23. Bode and her colleagues begin by discussing the research evidence that they weigh in favor of a positive effect of Internet use more broadly, and social networking sites more specifically, on both sociability and social capital. They then turn their attention to online news and blogs, successively, and connect to such important outcomes as perceptions of credibility, learning, and mobilization. Bode and colleagues end with a discussion of larger shifts regarding the media and politics, including in the nature of the public sphere, the conditions of political deliberation, and other implications for democratic practice. The section “In the Political Arena,” therefore makes both micro- and macro-level observations of the political scene, reinforcing the continued importance of long-standing elements of political campaigns including televised and newspaper news, political ads, and debates, but also reflecting the importance of newer elements or directions such as political comedy and political entertainment, online news, blogs, and social networking sites. The evolving media landscape has perhaps never been better illustrated – and its consequences more important – than within the realm of politics, as these chapters show.

The fourth and final section, Section VI, of Part 2, “On/Of Persuasion,” explores relevant theories and research results regarding advertising, marketing, and media

campaigns designed to persuade, either regarding products and services as in traditional advertising or regarding health and safety behaviors as in communication campaigns and social marketing. The unifying theme, therefore, is on purposive attempts via media and other forms of communication to convince audiences in favor of some outcome, whether it's the purchase of a product or the adoption of a behavior such as applying sunscreen or recycling materials and reducing trash. Relevant theories of persuasion are reviewed in this section, as is the empirical evidence for the conditions in which persuasive attempts are most likely to be successful.

In Chapter 24, Charles K. Atkin and Ronald E. Rice lead off this section documenting both their own seminal contributions to and emerging foci within the study of public communication campaigns. They illuminate the steps involved in campaigns, from design to early research to mid-process assessment and summative evaluation, and provide a thorough discussion of varying features of the persuasive message (such as emphasis on information vs. persuasion or the use of particular appeals) and the research record documenting their effects. In the latter part of the chapter, Atkin and Rice use three case studies to model the ways in which these processes unfold in contemporary communication campaigns.

The phenomenon of social marketing is defined and discussed and relevant empirical findings reviewed by Michael D. Basil in Chapter 25. Social marketing differs from communication campaigns in that it engages real-world conditions in an attempt to make the behavior change in question more likely through the facilitation of rewards or the removal of obstacles. Thus, Basil begins his chapter with some of the limitations of information-based campaigns and then demonstrates how individuals can best be influenced to make a behavior change when material conditions allow, for instance when mosquito nets are made readily available and affordable to combat malaria, and when a fleet of limousines can be employed to give rides to individuals under the influence to fight against drunk driving. Basil explains both the promise and the limitations of this approach and then reviews the empirical evidence from prominent prior social marketing campaigns.

Xiaoli Nan focuses on particular frames in campaigns designed to promote health in Chapter 26. She distinguishes between "gain-based frames" that show audiences members the advantages of adopting the behavior featured in the campaign and "loss-based frames" that focus on the disadvantages and negative repercussions that may follow from failing to adopt the behavior. Nan traces the intellectual history of the concept of framing and the attending observations about how and why individuals respond to messages framed as potential gains or potential losses differently. She identifies a number of important moderators of framing effects within communication campaigns, including the type of behavior targeted, the individual's degree of involvement with the issue at hand, other factors influencing motivation, and the perceived desirability of the end-state that the behavior change predicts.

The role of advertising in the lives of children is addressed by Moniek Buijzen and Patti M. Valkenburg in Chapter 27. The authors begin by applying the main theories regarding how individuals process advertising and other persuasive messages to the

unique development and cognitive capacities of children, focusing on the degree of cognitive elaboration (thinking the message through carefully and rationally) a message is likely to inspire. Then, they give a comprehensive review of the evidence for intended effects of advertising on young audiences, including on such outcomes as brand awareness, favorable attitudes toward brands, and purchase requests or attempts. Buijzen and Valkenburg then synthesize and discuss the research results regarding unintended effects of advertising on such outcomes as fostering materialism, triggering conflict with parents, influencing consumption of non-healthy foods, and diminishing overall satisfaction with one's life. Finally, they use the research record to express skepticism over whether advertising literacy, an outlook that has been shown to increase as children develop, actually decreases advertising influence, but optimism about the role of interactions with parents and caregivers to moderate such influence.

The section as a whole coheres around purposive attempts to use media and other communication strategies to convey information, sway attitudes, and shape behavior on behalf of a client with a goal, be it commercial (selling products and services) or non-profit in nature (working toward public health and safety). The section identifies theories regarding how individuals both young and old process such content, and discusses a host of factors that help determine whether particular desired outcomes will be achieved. The final chapter in the second part also serves the purpose of transitioning the reader into the final part of the book, which focuses on a segment of the media audience that has historically spurred the largest amount of concern regarding negative media effects, as well as the largest amount of promise for positive effects: children and adolescents.

The first section, Section VII, of Part 3 of the volume synthesizes the research on the implications of "Media Use and Effects on Learning and Development" in childhood. Learning is conceived of quite broadly in this section, first by focusing on formal measures of achievement in school and on standardized tests, and then by emphasizing social development, such as learning to take turns, to resolve conflicts among friends, or to embrace diversity in the social environment. The child audience is also considered with a wide lens in this section, with relevant discussion ranging from whether benefits may derive or negative consequences may transpire when television viewing begins before the age of two to the risks and opportunities afforded to adolescents by the Internet. Regardless of the age of the young consumer of media, the role of television, the Internet, and other media forms (and the genres and program types within) in learning school-based skills as well as how to relate to others is studied in the first section of the last part of the volume.

George Comstock begins the section by synthesizing the theories and empirical evidence for the role of media in children's achievement and performance in school in Chapter 28. With the use of many media forms rising, the potential displacement of time that might be spent with homework or other educationally enriching activities by largely entertainment-oriented media use is reviewed in this chapter. Comstock weighs the complex and varied studies that bring data to bear on the question of

whether television use, in particular, is associated with poorer performance in school or in academic testing as well as related outcomes such as attention deficiencies, slower adoption of vocabulary and language development, and diminished creativity and imaginative play. He then reviews the evidence for why such relationships occur, including displacement of time, interference with mental abilities, and socialization of attitudes toward schooling and the skills emphasized within, and concludes with a discussion of other media forms aside from television and moderating factors including the prominence of media within household norms.

Daniel R. Anderson, Heather J. Lavigne, and Katherine G. Hanson then assess the body of knowledge pertaining to the influence of educational television in Chapter 29. In order to do so, they begin with a discussion of the skills that need to be sufficiently developed in children in order to attend to the screen and comprehend its content, which, in turn, are necessary conditions for learning to occur. Anderson and colleagues organize the next segment of the chapter according to the age of the child, reviewing the small but growing research evidence for the consequences of television viewing among infants and toddlers age two or younger and then the much-larger body of literature for viewing among preschoolers aged two to five. Finally, they provide a review of such educational titles as *Sesame Street*, *Blue's Clues*, and other programs intended to promote learning and development for their impact on outcomes including "school readiness," a broad concept that includes verbal and numerical literacy as well as emotional and social skills.

In Chapter 30, Marie-Louise Mares widens the lens from educational to "prosocial" television, examining impacts from television that extend beyond school-related subjects and skills into such areas as stereotype reduction, friendliness, cooperation, and other "socioemotional" outcomes. Despite the positive intentions of producers, Mares uses the research record to demonstrate that "unaided" viewing of such content tends to have only weak effects. She shows that prosocial learning from television demands particular viewer characteristics and facilitative conditions that are not always present which helps explain why, for instance, many children have trouble understanding the moral in television and film narratives. Finally, Mares discusses ways to increase the likelihood that positive prosocial effects will accrue from media, including through repeated exposure, explanatory parental covieing (in which an adult watches with the child and points out important themes and messages) or supplemental activities to reinforce the messages received from the program (such as activities conducted in school).

Finally, in this section, in Chapter 31, Jochen Peter and Patti M. Valkenburg provide a broad treatment of the scholarship regarding adolescents and the Internet, reviewing statistics of use and constructive as well as potentially detrimental effects. The authors point to the ability of the Internet to invite self-presentation and self-disclosure as both a potential risk and a potential reward, especially pertaining to adolescents' identity and intimate relationships. In doing so, they first describe the features of the Internet that facilitate self-presentation and self-disclosure, including but not limited to its anonymous and asynchronous nature, and then they

discuss the relevant research findings on the ability of the Internet to impede positively or negatively (or both) on self-concept, self-esteem, friendship formation, and the quality of friendships. Communication with strangers and cyberbullying are both addressed, as well, and Peter and Valkenburg conclude their chapter with calls to strengthen and to integrate research in this increasingly socially significant topic area.

The first section of Part 3 of the volume, therefore, elucidates the role of both traditional (television) and newer (Internet) forms of media in the lives of children and teenagers. The section takes a nuanced look at the positive as well as the negative functions and effects of media on young people's learning and personal and social development. In doing so, it highlights many of the most headline-grabbing controversies about media effects in the twenty-first century, including whether "baby videos" like *Baby Einstein* actually make kids smarter, whether time spent with media has negative implications for doing well in school, and whether "stranger danger" or cyberbullying can victimize young people. Yet, it also emphasizes the pleasures and opportunities that media forms have created for youth, including building a bridge for preschoolers into the demands and expectations of elementary school, fostering an understanding of cultures different from one's own or encouraging cooperation and conflict resolution through prosocial programming, and providing a means by which to express one's self and build social relationships online for adolescents. Through these and other processes, the role of media as an agent of learning and development for young people is illuminated.

As with other audiences, young people's use of the media occurs within a wider social, political, and cultural sphere with a host of additional forces and factors. Section VIII, the final of this volume, describes three processes through which effects of media on young people can be mitigated in school by teachers, at home by parents and other caregivers, and at the level of government through the formation of public policy and regulation. These forces help shape the media environment of young people and the ways in which media messages are received. Therefore, the final section includes extensive discussions of media literacy, parental mediation, and children's media policy.

The section begins with Chapter 32, in which Smita C. Banerjee and Robert Kubey provide a thorough discussion of media literacy and the variables that maximize its effectiveness in encouraging children and adolescents' media analysis and production skills. They begin by defining media literacy and the growing subfield of media literacy as intervention, in which active cognition of media messages is encouraged as a means of mitigating media effects. Applied research testing the effects and effectiveness of curricular units for school-aged children in such areas as smoking prevention, drinking prevention, violence prevention, body image, and advertising awareness are reviewed in the chapter. Across these different topics, key variables are then identified from the empirical research that have a bearing on the likelihood of achieving desired outcomes, including the duration of the curriculum, the research design (including whether a control group is utilized), the age

of the participants, and modes of instruction (including the use of media clips and homework assignments to promote skills in media analysis, or exercises and activities in which young people create their own media to promote media production skills) or spurring “boomerang effects” in which undesired outcomes occur. The chapter represents an important synthesis of a growing emphasis within media effects research, the ability to intervene in undesirable media effects via lessons facilitated in the classroom setting.

In Chapter 33, Yi-Chun (Yvonne) Chen and Erica Weintraub Austin discuss another critical phenomenon, parental mediation – the role of parents and caregivers in setting rules, speaking up about content, and otherwise attempting to shape children’s exposure and response to media. The benefits of active mediation in which the adult converses with the child about the media messages during or after exposure are demonstrated by Austin and Chen’s review of the literature which shows, for instance, parents’ comments can make negative effects of violence viewing less likely and positive effects of educational television viewing more likely to occur. The authors then provide a convincing link between parental mediation and media literacy, two endeavors that are often viewed quite apart from one another, in being similar strategies differing primarily only by setting (in the home vs. at school) and participants (parents and caregivers vs. teachers) and not by substantive features. Thus, they examine the research findings for parental mediation and for media literacy pertaining to substance abuse, and they introduce a new study in which negative active mediation about tobacco and alcohol use was associated with higher media literacy skills among young adults.

Finally, the last chapter in the book is written by Amy B. Jordan and presents a detailed accounting of the relevant policy formations that shape the media landscape with which children interact. In Chapter 34, Jordan explains how goals of children’s media policy include maximizing their access to positive content and restricting their access to potentially harmful content and traces the development of such updates in children’s media policy as the Children’s Television Act of 1990 and its 1997 update, the Telecommunications Act of 1996 and the V-chip provision, and various acts pertaining to “decency.” For each of the policy changes that she includes, Jordan weaves in scholarly research on the implications of the change for young people. She also shows how federal funding, like federal regulation, can help determine the contours of the media landscape. Finally, she discusses the force of self-regulation by media industries as exemplified by such practices as voluntarily labeling CDs for the content of their lyrics and marketing healthier products to children in the food and beverage industries.

The final three chapters that comprise this last section of the book, therefore, are each about shaping access and responses to media, protecting young people from negative effects through such practices as comments from parents that counter negative messages, curricula that encourage critical orientations toward media, and labeling of programs that contain violence or other material that might be deemed objectionable by parents. Yet, each of the three processes discussed in

this section – media literacy, parental mediation, and children’s media policy – are sufficiently flexible to recognize and encourage positive roles of media in the lives of young people as well. Processes including parental coviewing, active mediation to reinforce positive media messages, curricula in schools that include making one’s own media, and policies increasing the presence of programs designed to benefit young people’s development are included within the emphases of the section, as well. The skills of negotiating media – both its use and its varying messages through content – are increasingly important to cultivate among children in a media-rich environment.

Conclusions and Future Directions

The vast number and wide range of topics examined in the 34 chapters that comprise this volume make the size and scope of media effects and media psychology scholarship abundantly clear. Research derived from this paradigm continues to occupy a large and significant presence in media studies. The field is simultaneously venerable and enjoying renewed growth as “new” media and new media applications spark fresh research questions and traditional media continue to provoke unanswered inquiries, as well. The state of the field is healthy, vibrant, and generative as the chapters of these established and emerging scholars demonstrate.

The chapter authors provide up-to-date and comprehensive reviews of the massive literatures within this research tradition, pointing in all cases to classic theories, patterns in research findings, and conclusions as well as recent directions. The authors also incorporate their own research into the chapters, demonstrating how the studies they have conducted have advanced the literature and how their own research can be placed into a larger context. The result is an “expert’s eye view” into each topic area, revealing the ways in which knowledge is produced and patterns emerge in social science.

One pattern that is apparent when one reads this volume is the careful attention in contemporary media effects/media psychology scholarship to exploring the complexities involved in individuals’ interactions with media. Nearly every chapter has pointed to a sizeable list of factors that have been shown to shape media effects in the topic areas covered in the book. A far cry from a simple “X causes Y” explanation for media effects, we have seen how multiple considerations pertaining to individuals themselves (such as their personality tendencies or the various aspects of their identity), to situations or circumstances in the environment (such as their interactions with others or conditions that may influence their mood) and to media content (including not only whether there is violence, sex, political content, persuasive appeals, educational programming, etc. but also *how* those themes are presented) are important variables. The trend, overall, in the field is toward intricacies in the rela-

tionships between and among these multiple factors and greater recognition of variation in media effects.

We have also seen the nature of media effects examined and explored some research that may even call into question whether “effects” is the best term to describe the field. When we think of the phrase “media effects” we likely envision the impact of media use on individuals’ thoughts, attitudes, emotions, behavior, and physiological state and the consequences of such impact for society at large. And, indeed, a great deal of scholarly attention is still focused on these critically important questions, as well it should. Yet, we have also seen that the research tradition explored in this volume has always extended well beyond media impact, into questions of media content, media uses and the factors that explain such use, opinions about and perceptions of media, and media policies enacted in the home, in schools, or at the governmental level. The media influence aspect of media effects scholarship, therefore, is a crucial part but only one part of a multi-faceted approach.

The idea that spending time with media causes some measurable change in individuals can be explored from psychological and social perspectives, as we have seen, but it can also be explored within responses of the body and mind. The systems for processing any incoming stimulus, including media, are explored in this volume, as well. Not an “effect” *per se*, but a means of making sense of media – attending, comprehending, perhaps responding emotionally, physiologically, or with greater cognitive collaboration, and so on – is an emerging focus in the field, as we have seen in this volume. The stimulation of such responsive systems is often measured not through pen-and-paper questionnaires or even observations of social behaviors but rather through physiological or biomedical means including brain scans, skin response, heart rate, and blood pressure. These indicators give important new insights into how individuals take in media, assign meaning to media texts, and respond.

The future of media effects and media psychology scholarship is wide open. With children and adults alike increasing the amount of time they devote to television around the world, with the digital revolution bringing Internet access to many, and with the increasing allure and adoption of technologies from the mobile phone to videogames to social networking sites, new research questions will undoubtedly emerge. With newspapers facing new challenges, with magazines’ ongoing search for the winning niche, and with commercial and community radio entertaining and informing audiences across the globe, new studies will be necessary. With advertising emerging in new locations in the ever-present quest for the desired audience, to persuade people to buy products or to adopt health-protective behavior, new inquiries will emerge. The world is becoming more and more media rich and media focused, and there will only be greater demand for social science research into the role of media in our lives.

There has never been a more exciting time to study the media. And this volume is an excellent place to begin!

Media Studies

The Interdiscipline of the Present and the Future

Angharad N. Valdivia

Media studies is a rapidly growing, widely relevant, and evolving field – an interdiscipline (Valdivia, 2003). While some scholars have bemoaned the loss of focus on process and effects, especially on milestone studies (DeFleur, 1998), others find the breadth and porous contours to be conducive to a worthwhile intellectual pursuit (Sterne, 2005). To be sure, between 1998 and the present, there has been a huge growth in interpretive and critical approaches, which have nonetheless flourished in the margins as the effects paradigm – the stuff of milestones – has firmly retained its central place in the field, at least in the United States and the Netherlands. Indeed, efforts to map out the diversity of the field of communication (Craig, 1999, 2001), which we might call the broader umbrella for media studies, yield a multiplicity of sometimes overlapping and other times mutually exclusive approaches. The terrain of contemporary media studies acknowledges that most of us live in intensely mediated environments, so that Livingstone (2009) writes on the mediation of everything, and Hay (2000) writes of refrigerator studies. The former expands on how media and communication are “ever more crucial in today’s world” (Livingstone, 2009, p. 13), and the latter asks us – as a field over a decade ago, while continuing to encourage us (Hay, 2010, 2011) – to consider the broader web of networks to which other technologies, such as refrigerators and toasters, contribute in terms of routines and practices that serve to mediate the world for us. The latter line of questioning has proven immensely prescient as many of us live in highly networked webs of media and communication, where not only can our location be pinpointed at any given moment thanks to elements in our mobile technology, but also, if we chose to, we can broadcast a narrative of our location and other audiovisual bits of information constantly to many – such as our hundreds of Facebook friends and Twitter or Tumblr followers.

Nonetheless, whether we are talking of old media technologies or institutions (see Nerone, Volume 1, *Media History and the Foundations of Media Studies*), we are witnessing the constitution of new audiences and a shift in traditional audiences (see Parameswaran, Volume 4, *Audience and Interpretation*) through the invitation offered by seductive content in a dynamically converging and synergized media environment (see Mazzarella, Volume 3, *Content and Representation*). The effects of these technologies and content continue to be measured and studied (see Scharrer, Volume 5, *Media Effects/Media Psychology*). While media platforms and patterns of production are converging, enduring tendencies toward concentration of ownership and control of media industries coexist with the emergence of new patterns of labor, practices, and updated forms of exploitation (see Mayer, Volume 2, *Media Production*, as well as some chapters in Gates, Volume 6, *Media Studies Futures*). This is not surprising given the rapidly expanding new media and communications technologies, many of whose functions replicate previous technologies while other uses (and abuses) bring new possibilities, utopian and dystopian, to the fore (see Gates, Volume 6). Unexpected global locations of nodes of influences result in previously unsuspected transnational alliances and networks (Castells, 2009).

As an early caveat to this triumphal celebration of media, I must remind readers that most of the above sentiment refers to a media-rich group that luxuriates in a wealth of networks and technologies. Yet we must not forget that even as I write this introduction at the very end of 2011, fully 50% of the global population have intermittent access to electricity. Mobile telephony may be widely spread, but the radio remains the most reliable global medium (see the *Journal of Radio Studies*). Beyond the fact that it is cheap, it neither relies on nor requires electricity or literacy, in English or any language. Furthermore, despite our current fixation with digital, wireless, and mobile media technologies, in times of crisis – whether natural such as a huge earthquake or in wartime – when the electric networks are down and we are thrown back into old school forms of media and communication, radio returns to its central location as a reliable and essential medium. So before you continue reading this introduction, or continue to read any of the absolutely outstanding volumes of this encyclopedia project, go out and buy yourself a radio – one that is both electric and battery powered. You might never need it, but if you do, you will be very relieved to have it.

The fact is that media are everywhere, and nearly everyone shares lifelong experience with and expertise on particular forms of media. Dating back to the 1920s – as identified both in Nerone, Volume 1 and Mazzarella, Volume 3, the study of media has been multi-modal and heterogeneous. Theoretical and methodological complexity has grown since the Payne Fund Studies. International, transnational, and global perspectives have become absolutely essential. Not that they ever were not, but now that media are produced, consumed, and circulated transnationally, media studies has to take this into account. Inclusivity of the heterogeneous components of the population in regard to the media has also grown. Scholarship that was once nationally bound and focused on White middle-class males has expanded to take into consideration gender, nation, region, age, ethnicity, sexuality, ability, and class.

Furthermore, as both Downing (2003) and Castells (2010) remind us, we must not forget the importance of religion in the contemporary world, as many armed conflicts revolve around religion, and media content, production, audiences, and effects are interlaced with religious impulses.

Media studies is an interdiscipline. As such it draws on and benefits from a number of contributing fields such as history, philosophy, psychology, political science, education, literature, and sociology. Yet even as it draws on those many fields, it is its own area of studies. Too often other fields, whose interdisciplinarity takes them into media studies, see this interdiscipline as new – as in, “oh look, we just discovered that we ought to look at media.” Our field becomes the direct object of other scholars’ deployment of the myth of discovery. Just like Columbus discovered “America,”¹ scholars from other fields continue to “discover” media and media studies. A century’s worth of theories and research disappears in the process, and many of us often find ourselves in other disciplines’ conferences listening to presentations that implicitly suggest direct effects, transparency, mimetic images, and so on. Transparency, when media content, industries, audiences, and practices are treated as if they spoke for themselves, as if there were no mediation, is often the tactic taken by scholars outside our discipline. What we as a field contribute to the understanding of culture and society is, at the very least, that mediation is complex and that understanding mediation helps us to uncover patterns of power, distribution, and potential justice. Media studies is about unearthing and maximizing the democratic potential of practices, institutions, technologies, and audiences that pervade our contemporary life.

Nonetheless, as Gates reminds us in her introduction to Volume 6, one central question for both the present and future of media studies concerns the very definition of media: What counts as media now that it no longer makes sense to limit the term to film, television, audio, and print? Does it still make sense to refer to a broad concept or category of “media”? If the more appropriate terms are “digital media” or “new media,” then what do *these* terms encompass? Terms like “convergence,” “remediation,” “interactivity,” and “user-generated media” capture a general sense of current transformations, but what are some productive ways of parsing out the complex dimensions and issues that these terms encompass? By paying careful attention to issues of history and context, this encyclopedia seeks to trouble the usage of these terms even as they are used rather carelessly in popular culture and public policy.

The six separate volumes of this encyclopedia were present as six separate sections in *A Companion to Media Studies* (Blackwell, 2003), the volume that provides the model for this encyclopedia and that was, in turn, modeled after McQuail’s *Mass Communication Theory*. The editors of the individual volumes put together a stellar cast of authors who in turn produced original chapters. All volume editors were asked, indeed implored, to compose a table of contents that was inclusive in many ways. First, inclusivity in terms of global topics was paramount, and we strived for inclusivity in terms of authors and global regions as well. This, as I have discussed elsewhere (Valdivia, 2011b), is not as easy as it sounds. Differential access to the latest research, culturally different approaches to writing and developing an argument,

resources that might enable a given scholar or team to develop a project and get it ready for publication, and so on, are all variables that effectively discriminate in favor of those of us in well-funded research universities in wealthy countries. We recruited some scholars whose work we translated into English, and all editors worked assiduously to cast as global a network as possible.

Another element of inclusivity was paradigm diversity. Schooled at the Institute of Communications Research (ICR) at the University of Illinois, I am the recipient of an educational tradition that highly values paradigm inclusivity. Insofar as it was possible, we included scholars using quantitative and qualitative approaches, sometimes both of them at the same time. Obviously the *Media Effects/Media Psychology* volume focused solely on the social scientific tradition, while both the *Content and Representation* and *Audience and Interpretation* volumes included scholarship using both approaches. A third element of inclusivity was gender, race, and sexuality diversity. Cutting across as a focus that can be conducted in the research included in any of the six volumes of this project is the work of transnational feminism and globalizing gender studies (Hegde, 2006). Editors sought scholarship that would include these vectors of difference, as media studies really makes no sense without their consideration. Yet even within each of these categories we encounter new gaps that merit more research. For example, as Mazzarella mentions in the introduction to Volume 3: “the reader might notice that the volume is heavy with studies of cultural representations of females. Indeed, seven chapters deal with some aspect of this topic, while only one deals with masculinity. Yet this is representative of the field, as studies of media portrayals of women and girls have been very prolific, and media studies scholars have only recently begun to seriously study mediated portrayals of masculinity(ies) (Mazzarella, 2008).” The rise of masculinity studies follows feminist studies as a logical move once we realize that femininity is socially constructed. Indeed, this is a process that this collection of volumes entices us to accomplish: a greater degree of preciseness to this complex concept of media studies, which all of us who work within the interdiscipline intellectually seek to explicate.

As a final note about process, these volumes have been peer reviewed in an innovative manner for an edited collection. First, each table of contents was submitted to the peer review of a senior scholar within that area of the field and edited accordingly. Then, as the chapters came in, within each volume authors reviewed other chapters. Ideally, each chapter was reviewed by two other authors as well as by its editors. As the overall editor of the project, I carefully reviewed all volume editor introductory chapters. Now the review process is turned over to you, the reader.

Media Studies Today

As an organizing principle for this book, I have followed since 2003 the structure provided by many different editions of Denis McQuail’s *Mass Communication Theory*:

An Introduction. Dating back to the first edition in 1983 and up to the sixth edition in 2010, whose name has changed, appropriately enough, to McQuail's *Mass Communication Theory*, Denis McQuail provided a manageable way of dividing up the field into components that, while overlapping – as they had to be since these components were teased out more for scholarly inquiry than because they are discrete and differentiated – provided a useful way to look at the breadth of study of the media. We all experience media as an integrated experience. Media inherit values and histories that are in turn explicitly or implicitly incorporated into their production; then we either consume and/or interpret media in relation to regimes of representation, with particular audiences and interpretive tactics in mind, with some desired effects over which we have little control, and contributing to a future that – like effects – we wish we could influence but really cannot. Still for the purposes of research, we tease out the media experience into a number of areas.

The volumes of this encyclopedia match the sections of the *Companion*, which used McQuail's schema and added the “futures” section. Thus we have history, production, content and representation, audience and interpretation, media effects/media psychology, and futures. We will later add a “methods” volume to complete the encyclopedia. While these areas are teased out for the purposes of research, there is great cross-pollination by scholars in media studies. We find that some scholars use both qualitative and quantitative methodologies, or at least rely on both. We also find that many scholars write about two or more of the six areas mentioned above. In fact, many of the major trends in current research encompass holistic media studies approaches. Among these contemporarily salient research projects are network analysis (e.g., Castells, 2009, 2010; Chan, 2007, 2011, forthcoming; Gilbert, Karahalios, & Sandvig, 2010); girl studies (Banet-Weiser, 2011; Durham, 2004; Projansky, 2007a, 2007b, 2010; Valdivia, 2008, 2009, 2011a); transnational feminism (Hegde, 2006; Molina Guzmán, 2010; Valdivia, 2011b); and neoliberalism as an undergirding framework of analysis (Banet-Weiser, 2011; Hay, 2000, 2010, 2011; Hoerl & Kelly, 2010; McCarthy, Pitton, Kim, & Monge, 2009). McCarthy (2011) expands the focus of neoliberalism in media to the educational system and the efforts of many cities, such as Chicago, to become a cosmopolitan, globally vibrant center of economic activity, thus linking media studies to educational policy studies.

Many of these recent research tendencies converge in the critical examination of the “posts.” Scholars develop amazing analyses demonstrating the potential of an intersectional approach that uses race, ethnicity, gender, ability, sexuality, and class all at once, for people experience these elements in an integrated manner. Roopali Mukherjee's *The Racial Order of Things* (2006) set the bar for intersectional analysis of the “post-soul” era. Tasker and Negra (2007) provide a comprehensive introduction to the political implications of postfeminist culture, while Molina Guzmán and Valdivia (2004) apply the intersectional approach to the study of celebrity Latinas. Joseph (2010), in her provocatively entitled “Tyra Banks is Fat!” (a title that, to be fair, comes straight out of tabloid magazines and television coverage), explores the implicit racism and sexism of the postracial and postfeminist veneer of reality

television in general, and Tyra Banks's brand in particular. Molina Guzmán (2010) explores the transnational deployment and commodification of the Latina body, both spectacular and everyday. The politics of the post appears in all elements of media studies as these scholars foreground media studies even as they situate their work within a broader context of geopolitics and the dynamically changing mediascapes. While it may be fashionable to suggest the end of media studies, just as others have previously declared the end of history or of ideology, what this encyclopedia convincingly illustrates is the field's ability to expand as new practices, technologies, and institutions arise. As many of the editors and contributors will document, "new media" is a misnomer as neither the technology nor the uses or assemblages are so new (see Morley, 2006). What at first may seem to be epochal breaks are revealed by many of the contributors to be far more continuous elements in relation to history, culture, and media.

Editors and Volumes

We begin with normative theories and history. **John Nerone**, author of *Violence Against the Press: Policing the Public Sphere in US History* (1994), co-author, with Kevin Barnhurst, of *The Form of News: A History* (2001), and co-author and editor of *Last Rights: Revisiting Four Theories of the Press* (1995), as well as author of many other journal articles and book chapters, is the perfect historian to lead us through this fertile terrain of scholarship. Volume 1 on history underscores that while all media have long histories, historians agree neither on the definitive tale of origin nor on the particular historical approach. Moreover, Nerone, the careful historian, alerts us to the fact that even our use of the word media in relation to communications is quite recent.

Nerone's volume includes normative and historical approaches. Historical research, drawing on normative frameworks or not, continues to offer media studies scholars great insight and tools with which to understand contemporary media. Furthermore, there is great diversity within historical approaches to media studies. Beyond cultural memory and special effects as components of media history, we are also witnessing an explosion of careful work that revisits the archive, data, and documentation. Kafka (2009) brilliantly studies that most elemental component of media – paper. It seems like such a simple task: how do we study the construction and use of paper, the "bureau" in bureaucratization, the work of scribes? Kafka concludes that: "As scholars continue to research the history of paperwork, we need to keep in mind that we are defending not only the 'historical record,' but the political one" (2009, p. 352). Indeed, these are the perfect words to keep in mind as we read the volume on history so elegantly crafted by John Nerone.

Volume 2, *Media Production*, is composed by **Vicki Mayer**. Among the many publications by Mayer, we can list *Below the Line: Producers and Production Studies in the New Television Economy* (2011), *Producing Dreams, Consuming Youth: Mexican Americans and*

Mass Media (2003), and *Production Studies: Cultural Studies of Media Industries* (co-edited with M. J. Banks and M. T. Caldwell, 2009). Mayer begins her volume by reminding us that “[M]edia production is frequently the most invisible aspect of our relationships with media. In the storm of media messages we encounter, we rarely consider where they came from, who made them, and how.” We expect to find, and we are not disappointed, a combination of keen attention paid to the sociological approach to our field, something about which McQuail had previously written in *Towards a Sociology of Mass Communications* (1969), and the more critical analysis of neo-Marxist political economy now accompanied by a focus on labor issues in the global setting. Moreover, as explicitly stated in one of her book titles, Mayer paradigmatically maintains a dialogue between political economy and cultural studies, an approach that resonates with globally used approaches in our field. The tension between structure and agency pervades this fine volume. Mayer remarks that “[I]f the focus on social structures has implicated the modern state in the study of media production, the focus on the agency that people exert over media production implicates the modern project to create enlightened subjects who can embody, perform, reflect on, and actually become media producers.” So the new production studies is global by necessity as transnational ownership and production of media industries cannot be denied; blends political economy and cultural studies; foregrounds issues of labor, both above and below the line; and takes up issues of networks, intellectual property, and subjectivity as producers are constructed in terms of categories of identity.

Sharon Mazzarella, a prolific scholar of issues of youth and the media, leads us through the wide world of “content and representation.” Author or editor of books including *Girl Wide Web 2.0: Revisiting Girls, the Internet, and the Negotiation of Identity* (2010), *20 Questions about Youth and Media* (2007), *Girl Wide Web: Girls, the Internet, and the Negotiation of Identity* (2005), and *Growing Up Girls: Popular Culture and the Construction of Identity* (2001), Mazzarella is a rigorously trained social scientist who also pursues qualitative research. As such she is the ideal editor for this volume, which is respectful of both of those methodological approaches. Indeed, for many a budding media studies scholar, content and representation provide the first point of entry, as these are the aspects of media that we experience most directly. Although, of course, all media have normative implications, histories, and a complex web of production, most people focus on the finished product: the television show, the movie, the blog, the social media website, the song, the newspaper, the advertisement, the catalogue. Content analysis is alluring yet amazingly difficult to carry out. Representational analysis also bears the sophistication of a range of theories. Neither is an easy task, and quantitative approaches complement interpretive studies. Mazzarella presents a persuasive argument as to why content/representational analysis remains an essential component of media studies and why projects that are well carried out tell us much about the world and the circuit of culture. Unsurprisingly, this area of research continues to be plentiful.

Radhika Parameswaran edits Volume 4 on audience and interpretation. Parameswaran’s research includes two long articles in *Journalism and Communication*

Monographs, “Melanin on the Margins: Advertising and the Cultural Politics of Fair/Light/White Beauty in India” (2009, co-authored with K. Cardoza) and “Global Media Events in India: Contests Over Beauty, Gender, and Nation” (2001). Her work has focused on the intersection of feminist cultural studies, gender and media globalization, South Asia, and postcolonial studies with a particular emphasis on issues of audience and interpretation. As such she constructs a volume worthy of her areas of expertise, with plenty of chapters illustrating global and gender issues. This volume also bears the traces of an interdisciplinary field that includes social scientific paradigms such as uses and gratifications as well as more humanist approaches that now include global and online ethnographies. Parameswaran remarks that “audience studies has not only survived the backlash against its populist tendencies in the late 1980s to mid-1990s, but it has also thrived and expanded to include a range of audiences, media genres, modes of audience engagement, and institutional and international sites of reception.” “Populist tendencies” refers to the “discovery” of the audience around every corner, as it were, without proper attention to issues of power and structure. In the contemporary moment, audience studies is vibrant and innovative. Whether we look at fans or online digital communities, to mention just two of the many possibilities, the construction and potential agency of the audience are major issues that continue to guide the production of media and subjectivities. Illustrative of the many philosophical quandaries undergirding the location of the audience within media studies is Jack Bratich’s chapter in Volume 6, as audience analysis is part of the present and future of the field. In addition, audience connects with issues of production as it undeniably takes labor to be part of any audience.

Erica Scharrer guides us through the fifth core component of media studies, media effects and media psychology, the dominant paradigm in the United States as well as in other global settings such as the Netherlands, and the paradigm that reaps the most funding in a positivist framework that values scientific demonstration of impact. Scharrer has co-authored, with G. Comstock, *Television: What’s On, Who’s Watching, and What it Means* (1999), *The Psychology of Media and Politics* (2005), and *Media and the American Child* (2007), and, with L. Weidman and K. Bissell, a long article in *Journalism and Communication Monographs*, “Pointing the Finger of Blame: News Media Coverage of Popular-Culture Culpability” (2003). Scharrer brings to the volume on media effects/media psychology a long-standing engagement with the social scientific paradigm in our field. A well-carried-out effects study tells us much about the influence of media on individuals, groups, and societies. The field of media effects, therefore, is presented with both the challenge and the opportunity to sort out these complex and potentially idiosyncratic experiences in a context in which the number of media outlets has proliferated, their use occurs at virtually any location and time of day, and their consumption and purposes intersect and converge more than ever before. Thus Scharrer asks: “Why are individuals drawn to media to such impressive degrees? How do they process and make meaning from media messages? What types of content are they both receiving and creating when spending time with media? What are the consequences of such media use? What factors and conditions

help explain why individuals vary in their responses to media? And what factors and conditions may moderate or mediate such responses?" These questions require complex methodological and theoretical expertise to answer. Many of us were schooled in a critique of the "hypodermic needle" model, though we have since learned that the media sometimes have or generate direct effects. Why else does a multibillion dollar advertising industry exist in the United States? However, we continue to marvel at the long-term cumulative effects that are far more complex than we originally anticipated. Furthermore, effects scholars, such as many of those contributing to Scharrer's volume, seek to explore how to effect positive change as well as how to avert more nefarious outcomes.

Finally for now,² the encyclopedia concludes with Volume 6 on media studies futures edited by **Kelly Gates**. Gates's own research is the veritable embodiment of a focus on futures. Author of *Our Biometric Future: Facial Recognition Technology and the Culture of Surveillance* (2011) as well as co-editor with Shoshana Magnet of *The New Media of Surveillance* (2009), Gates studies the discursive formation of the wishful deployment of recognition technology with an "almost gleeful futurism" that suggests "if only" the systems were in place, before 9/11, for instance, our present and future would be different, better, and so on.³ Futures is, by definition, a transient category, as within 10 years the content of this volume will be the stuff of the present, or maybe even the recent past. As Raymond Williams has written, we cannot anticipate what will be an emergent media form until it is *post facto*. The futures volume takes up some of the issues around Internet, gaming, social media, mobile telephone in a converged media form, biopolitics, and digitalization technologies such as biometric body scans. Gates asserts that media studies needs to take seriously the possibility that *radical uncertainty and contingency* are the only features that define where media are and where they are headed. All of the chapters in this volume could be retrofitted into the other five volumes. Yet together they compose a vision of the field as it moves forward, taking up issues that date back centuries, engaging them with theories and modes of media that only apparently represent new terrain.

This is the state of the art of media studies. It is a field where we know better than to use the term "new" media – for all media are somewhat new but also very old in many of their aspects. Scholars in this encyclopedia take us back to the production of paper even as they bring us up to the latest technologies, assemblages, and institutions that arise to mediate our world. Contributors to this encyclopedia share the belief not only that media studies is an academic exercise, but also that by engaging in this important area of studies we are somehow contributing to a more just vision of the world. As the separate volumes build on each other, whether we are engaged in media at any of their analytical nodes (production, content and representation, audience and interpretation, media effects/media psychology), we are simultaneously linked to its history and its future. As a diverse heterogeneous field that is global, interdisciplinary, intersectional, multi-methodological, I cannot imagine a more exciting and potentially liberatory academic enterprise to be involved with.

NOTES

- 1 In this introduction and whenever possible, this encyclopedia uses “America” to refer to a continent and “US” or “United States” to refer to the country, unless we are quoting from scholarship that uses “America” otherwise.
- 2 A *Methods* volume is projected to be released at a later date, edited by Fabienne Darling-Wolf.
- 3 Few people know that Gates submitted her dissertation proposal the day before 9/11. What to the committee seemed like futuristic queries became the very real present within a period of 24 hours.

Media Studies

Diagnostics of a Failed Merger

Geert Lovink

ABSTRACT

According to Geert Lovink, there is no such thing as a “visual culture” that connects film, television, video, and new media. In this chapter, he argues that this mistaken belief has led to the naïve notion that we are all working on the same project, “the media.” In fact, Lovink argues, humanities-based “media studies” has never had a grip on new media and Internet education. The idea that media are all about images is contradicted by the reality of computers that run on code. A deep institutional confusion holds that new media are ultimately subordinate to the old content-based broadcasting industries and their outdated revenue models. This essay argues for a long overdue goodbye to the convergence tendencies within media studies departments in favor of full autonomy of new media initiatives. The purpose of critical research into digital technologies is not to rescue the film and broadcasting industries but to develop concepts for the ever-expanding digital realm itself.

Am Anfang steht das Ende, sonst wäre das Neue das Alte.

[Every beginning starts with an end, otherwise the new would be the old.]

(*Radikal* magazine, March 1984)

The question of how to interpret the Internet and new media is too important to be left to university course managers. Humanities-based “media studies” never had

a grip on new media and Internet education. Nor did it shape the new media field by being at the forefront of early-adopter waves. Via ineffective, calcified, and divergent combinations, the container concept “media studies” tumbles literature, film, radio and television, theater, design, visual and performing arts, and new media into one jumbled, convoluted label. Humanities-based media studies did not position itself as an oasis of radical critique, nor did it make a case for dedicating itself to the past with the aim of further developing the “media archaeology” approach.

This dialogical manifesto intends to shuffle away institutional rubble. Needless to say, this is done with the interests of new media, digital culture, Internet, and software studies in mind. The time in which we could have made a case for “the media” in general is well behind us. The term “media” has become an empty signifier. The same can be said of “digital media” since everything is digital anyway. In times of budget cuts, creative industries, and intellectual poverty we must push aside wishy-washy convergence approaches and go for specialized in-depth studies of networks and digital culture. The presumed panoramic overview and historical depth suggested in the term “media” no longer provide us with critical concepts. It is time for new media to claim autonomy and resources in order to leave the institutional margins and finally catch up with society. There are at least three major obstacles to getting there: first, theory lags behind its subject and falls victim to its own general claims; second, media studies is still characterized by an awkward legacy within academia; and third, the new media landscape itself changes so rapidly that it makes a slippery object of study. I will examine these concerns before offering up some unlikely futures for the field.

When Theory Loses its Sting

During the first decade of the twenty-first century, media studies fought a losing battle to keep up with the pace of technocultural change. If we are to have any hope of catching up we must consider the digital networked realm as a distinct sphere that demands its own theoretical vocabulary and methods. Digital media studies rarely has been much of a critical intellectual project. The maniacally impulsive culture of pop has proven to be a black hole for theory talent. Instead of generating concepts at a Twitter pace, most “new media” ideas are neutralized and flattened within a general atmosphere of budget cuts and slow change. Staff within higher education are tired of reform anyway. While struggling to distance itself from vocational training, academic media research has so far failed to develop appealing schools of thought. Faced with this ever-growing gulf between theory and practice, media studies staff can do little more than fight the bureaucratic monsters that breed in their unbounded meta-discipline. Media studies is presently an abandoned construction site, crumbling under its own neglect. Do we willfully continue a failed project? Or should we acknowledge its growing cracks and cel-

celebrate its successes as we raze it to the ground and start anew? All too often the question is this: How do new media fit in? For pragmatic reasons new media scholars have thus far made a case that their field of study has an “elective affinity” with design, television, film, management, whatever . . . but it never has. This strategy of disguise has now exhausted itself.

The reason for conceptual stagnation goes back to the very notion of media studies itself. Instead of synthesizing research methods and underlying theoretical concepts into an ambitious philosophical or theoretical unity, general media studies carries the weight of a heterogeneous bag of twentieth-century paradigms, ranging from hermeneutics, mass communication, feminism, and postcolonialism to visual studies, depending on the intellectual history of the specific country. If we look at textbooks, the canon has remained steady for the past 15 years, jumping from Benjamin and Brecht, via Innes and McLuhan, to Williams, Baudrillard, and Kittler, with personal tastes for Flusser, Virilio, Ronell, and Luhmann. While none of these thinkers directly deals with contemporary issues of networked digital environments, there have been enough conceptual splinters, or found footage, within these mostly general theories to satisfy young new media scholars. These so often negative visions worked as antidotes to the unreconstructed positivism of business gurus and consultants. As long as the theory toolkit remained useful it yielded productive relationships. It was a powerful gesture to celebrate the end of the social, the political and historical. This started to change around 2001 when the speculative years ended after 9/11 and the dotcom bust. Slowly, theory became historicized. Theory is no longer a potpourri of living ideas but a fixed collection of twentieth-century canonical texts. The difference between media theory (as a concept pool) and “media archaeology” started to dissipate. The humanities heritage, once seen as a rich source of weird (while irrelevant, nonempirical, and untimely) powerful insights, started to show its weak spot: the social. What had once been a liberating feeling – finally to avoid conventional topics of social theory – returned as a rediscovery of social formations such as communities, mobs, tribes, and, yes, social networking sites.

Unfortunately these concepts are ill prepared for the fluid media objects of our real-time era. Such analysis will by default favor visual representations (because this is what these scholars with their film, television, or art history backgrounds are trained to analyze) but neglect social and interactive dynamics. Do we truly expect to find exciting openings and applicable insights by “reading” YouTube under Spivak’s guidance and watching *Heroes* with Žižek in your favorite interpassive mode, flowing through the national libraries with Castells, understanding Google *à la* Deleuze, or interpreting Twitter via Butler? Not only are these “cultural studies” outcomes predictably inadequate, the approach itself is flawed. Whereas this type of theory critique applies to many fields, it is also valid for media studies. The mechanical application of theory to the object (read X with Y), while abstractly subversive and innovative in moments, lost its critical edge some time ago. A principal function of theory – to foster socially crucial lines of questioning while energizing and supporting those who do the theorizing – has been neutered.

Many media practitioners are unaccustomed to thinking within, much less playing around with, theoretical frameworks. US scholar Henry Warwick, who teaches new media courses at Ryerson University in Toronto, says:

There is a consistent danger of being informed by an unthinking and uncritical acceptance of popular tropes, an empty and ignorant formalism. [...] Digital media is seen from a non-theoretical framework and is implemented in an instrumental manner. Film departments often no longer focus on film, but in fact produce video. Illustration departments don't focus on watercolour, they teach Photoshop. [...] One economic example of the urgency of the contradictions created by this situation is indicated by the Canadian Television Fund, which changed its name to the Canadian Media Fund, and now requires applicants to submit online strategies with their television proposals even to be considered for funding. (Personal communication, June 6, 2009)

In a similar move, the Dutch Cultural Broadcasting Fund ("Stifo") was renamed as the Media Fund.

The underlying problem of media studies is that "theory" no longer mesmerizes. It has lost its capacity to capture the collective imagination or to stimulate its core believers. The once progressive content simply no longer captivates audiences, especially younger ones. Some theories in certain decades were in sync with the *Zeitgeist*. They seemed to talk to everyone's concerns in a miraculous way. Read them 20 years later and they're dead. Go back to them 50 years later and their weirdness is quaintly charming. These days, the holy scriptures of Parisian Theory are often perceived as indifferent text machines that exist for one sole reason: to legitimize academic positions. They are stating the obvious in a crypto-code that is meant for aliens. How did we end up in such a sorry state? Why is media theory a dead horse? Due to the drifting definition of media, "postmodern" theories have become outmoded very quickly. There is no sense in applying McLuhan or Derrida to Wikipedia, for instance. In the past, media theory, when combined with speculative metaphysics and wide conceptual landscapes, provided a way out of the provincial atmosphere in English and Germanic literature departments, but this is no longer the status quo that media studies must engage with. The out-of-context, speculative conceptualization that set apart these original text-based hermeneutics of literary theory has been replaced by neoliberal managers who tidily control research output through academic journals, thereby banning more experimental and speculative modes of writing such as essays that cross genres and disciplines.

According to Australian-US media theorist McKenzie Wark, who teaches at the New School in New York, "people will do some great work on few resources if they believe in it. And they will do better work. It's no accident our canon is full of people who were marginal: Marx, Benjamin, Debord, Baudrillard. They did not have National Science Foundation grants, they had passion. They had 'colourful biographies'" (personal communication, June 6, 2009). Lev Manovich, working out of San Diego, California, where he heads a software studies center, explains that theory of the 1960s, 1970s, and 1980s is often not very relevant "because commercial culture and

computers today run on many principles of this theory – from irony and the self-referentiality of advertising to ‘rhizomatic’ networks. So to use many of these theoretical concepts is to state the obvious” (personal communication, January 1, 2010).

Exodus from Media Studies

If the study of new media wants to mature and reach its potential to match the actual scale and diversity of its object of study, it must divorce itself from “old media” and go solo. We long ago passed the point where it is necessary to explain the use of the computer, what “digital” is, and the Net to less technologically adept scholars. Instead of fighting over diminishing resources, it is time to throw caution to the wind and go for uncompromised growth. The grand synergies of the multi-, hyper-, and cross-media approaches may have worked as business concepts in hyped-up demo-or-die corporate culture, but in the publish-or-perish environment of academia, these synthesizing approaches have only delayed new media research. Hollywood films such as *The Lawnmower Man* and *The Matrix* never had much to say about the existing global new media culture. At best they were interesting fantasies about how to escape the boring, busy neoliberal (“There Is No Alternative”) lives people are caught up with. In retrospect, cyberculture has been a subcultural trap for those interested in body politics and visual representation, but a dead-end for Internet and new media theory. We need to say no to the “representation” school of media studies that reduces all issues to comparative aspects of imagery – not because we have resolved the Media Question and surpassed all of its issues, but because we need the speed and scaling-up that such independence can grant.

For a proper study of the Internet and other rapidly growing sectors, such as mobiles, geo-media, and games, we must demerge and liberate the “digital” from its confinement in general media studies. Digital network education and research need to declare independence. We must leave behind the tired dialectic of old and new and the dull atmosphere of competition with print and broadcasting. Instead of negotiating to death over broad resemblances, we need to define the specificities of these emerging platforms. Literary analogies do not translate into topical knowledge that can be mobilized inside the politics and aesthetics of the daily “protocol-istic” fights that go on around us. There is and always will be remediation, as it is implicit in the digital realm. No one claims to start with a blank page; but the age of infancy is over. Whatever constitutes the “death(s) of cinema” or “the end(s) of television” are other people’s business.¹ We need to study in detail the specificities of digital, networked modes of working, real-time pressures and the mobile dimension of today’s media experience. It is time to take the Internet, computer games, and mobile phones, now loosely gathered under this broad umbrella subject “new media,” on their own terms. Instead of wasting time on the destiny of printed newspapers,

our attention is urgently needed in fields such as location-based services, cloud computing, search, online video, and the “Internet of things.”² The debate about “free” and sustainable models for the Internet economy has reached mainstream audiences yet there is very little theoretical grounding, be it positive or negative, to help guide us through these fluctuating times.

Let us also look at the underlying metaphor that drives media studies: the idea of the “merger,” in this case of disciplines and platforms, driven by the multidisciplinary dream that “we are all working on the same page anyway.” CNET author Steve Tobak (2007) fittingly sums up the fate of doomed mergers in the business world: “Some failed so spectacularly that the combined company went down the tubes, others resulted in the demise of the executive(s) that masterminded them, some later reversed themselves, and others were just plain dumb ideas that were doomed from the start.” So what’s the destiny of media studies? “A 2004 study by Bain & Company found that 70 percent of mergers failed to increase shareholder value. More recently, a 2007 study by the Hay Group and the Sorbonne found that more than 90 percent of mergers in Europe fail to reach financial goals” (Voigt, 2009).

One can reject the banal translation of business lingo to academia, but why would this be so different in education? Due to constant reshuffling, the programs and departments we’re talking about here are not exactly marriages (which have a failure rate of 40–50% themselves). What if the supposed communalities and synergies between old and new media simply do not materialize? Note how Time Warner is undoing its merger with AOL, “allowing Time Warner to concentrate on creating television shows, movies and other content without having AOL hanging like an albatross around its neck” (Lafayette, 2009). With a push toward vocational training, stagnation in cultural studies, and a distaste for theory in general, film and television studies programs can only make defensive gestures toward the ever-expanding digital realm. All is lost if this or that merger between disciplines and programs doesn’t work out.

The future of media studies instead rests on its capacity to avoid these forced synergies toward “screen cultures” or “visual studies” and to set out on a path to invent new institutional forms that connect with the collaborative and self-organizational culture of teaching and research networks. Unless media studies makes such a move it will join the vanishing objects that it assumes as constitutive of media in society. What exactly would be lost by trying a new approach? Is it not time to just say farewell and move on? Perhaps in some institutional contexts a collapse of media studies and media and communications makes sense (even most insiders have no clue where the disciplinary boundaries between humanities and social science have to be drawn anyway). In other cases it could be more interesting to merge with art and art history programs, thereby strengthening the still weak “technical” arm of visual studies. In rare cases one could even think of moving new media into computer science, but there are no examples worldwide that “cultural” approaches are welcome in that well-resourced (and therefore) introverted and self-satisfied context.

Unfortunately there is an unspoken attitude of indifference, if not of superiority, from contemporary cultural theory toward new media. Are we repeating the high-low divide yet again?³ What is the price of ignoring the specific exigencies of a medium by heavy-handedly applying the works of Freud, Lacan, and Foucault to media products in desperate attempts to gain scientific recognition?⁴ These uses of theory, practiced in cultural studies programs and art academies around the globe, can also be read as leftovers from the 1990s when there was an abundance of speculative theory and not enough empirical data and (digital) methods. A decade later we have to renegotiate how much technical programming knowledge humanities researchers need as a basic skill. To what extent should you write software to be truly creative with digital means? Should writing code be required in undergraduate media programs? Explain it to your nephew: media studies is not cultural studies, not visual studies, not communication studies. But what is it, then?

A Blurry Heritage

This brings us to the second problem, one that is implied in the first: media studies had little coherence as a field or a discourse from the beginning, and it has always been accused of faddishness and hot air even before taking off. What is lacking in media studies is a *Geburtsmythos* (birth myth).⁵ As an academic genre, it sprang out of the heads of education consultants and bureaucrats and blended into unrelated departments and intellectual cultures, in order to scale up output. Unlike cultural studies, which can claim its emergence from the social conflicts and confusion of postwar Britain, media studies has been a managerial construct from the beginning, a half-heartedly positioned, top-down merger between literature, theater, communication studies, and a handful of others, depending on the local situation.⁶ Because of technology's maladroitness in its initial phases, media studies was given second-class citizenship in the academic society: neither inside nor outside. It is vocational enough to play a role in the media business; tough yet not sophisticated when compared to philosophy. In retrospect, it would perhaps have been a better proposition to situate media studies as an offshoot from literature studies (as still happens in certain places), which is the birthing ground of most media theory, from McLuhan to Kittler (and where I received my PhD from at the University of Melbourne).

Media studies exists in a variety of precarious positions. It is found nestled between media and communication programs with a social science emphasis, within fast-growing and economically successful vocational training at universities of applied science due to the growing importance of MBAs in the recent reawakening of the social sciences, and inside the creative industries paradigm. Last but not least, there is computer science, which, despite declining student numbers due to outsourcing IT services to India and other countries, receives hundreds of millions of Euros in funding.

This situation was made worse by the fact that very few people, if any, foresaw the ensuing IT explosion as software and its infrastructure imposed itself on all sectors of society. Instead of firing up debates and developing critical concepts, crucial time was wasted on the unproductive question of how “new media” could be integrated into “old media” departments.⁷ The genealogy of the computer, rooted as it is in mathematics, the military, and cybernetics, still hasn’t found an equivalent to the art history approach of visual studies, which collapses painting, photography, film, and Internet into one analysis. The visual studies perspective does not privilege the (technical) carrier concept as in media studies. The parallel histories of code and the image make it a difficult task to bring them together in one curriculum only to pretend to students that they are all one and the same, namely “media.” Convergence, in its latest incarnation as “cross-media,” “screen studies,” and “trans media,” has always been criticized for its reductionist business approach. Not everything can, or should, be reduced to zeros and ones, much in the same way that human experience cannot be reduced to “visual culture.” There is more to media than reception. As Matthew Fuller states: “If we instead emphasize production, whether this is as practice-based research, or a Deleuzian emphasis on expression, the problem of genealogy gains a different inflection” (personal communication, June 30, 2009). Would any regular user of technological media consider it an astute decision to lump TV, radio, and fine arts alongside the mobile phone, Twitter, and Google? Users are actively participating and sharing on a daily basis. Where is such a classification in our highest educational institutions most likely to lead us: to the avant-garde edge of expertise or to some backwater thought-swamp?

Yet compared to the growing demand in the labor market for new media expertise, the academic sphere’s focus on and development of the new/digital media discipline has been startlingly negligent. Why would communication studies, literature programs, film, television, and cultural studies, themselves often only a few decades old, welcome an aggressive predator in their midst? Whereas on the technical-infrastructure level much has happened, the public perception of “old” and “new” media has only grown further apart. Throughout society serious frictions and conflicts are on the rise around such notions as intellectual property rights, online language politics, and techno-libertarianism, yet the supposed new media intellectual experts play a very small role in such conversations. This is particularly distressing as arts and humanities departments face serious competition from anthropology, sociology, information studies, science-technology-society (STS) programs, and even management and organization degrees. It is time for the humanities’ new media community to set off the alarms. There is a serious case to be made for approaches that are rooted in the history of ideas, for approaches that stress the importance of aesthetics and critical conceptual thinking to reflect the current state of affairs. Society is asking critical questions that land squarely at the feet of new media: what are the social implications for the production of online subjectivities? What are the politics of information visualization? How are global relations and local cultures

going to manage the information tidal waves? What effects can we expect from corporate walled gardens and national webs?⁸

The diminishing role of linguistic theory, along with the shrinking presence of humanities and stagnating staff numbers, doesn't help either. At this moment, we can look back on a decade of hard work by new media pioneers to set up programs that yielded only modest results. They started building a comprehensive body of critical concepts and related case studies, yet there is still a lack of classic texts produced between the years 2001 to 2009. Few books and art works can match the vital energy and speculative madness of the 1990s. Despite its shortcomings, Manovich's *Language of New Media*, published in 1999, remains one of the few canonical texts known to outsiders. But even this text, in retrospect, tells us more about 1990s multimedia culture than the Google age of blogs, Twitter, and social networking sites. And look at *The New Media Reader*, an otherwise quite useful series of texts edited by Noah Wardrip-Fruin and Nick Montfort that functions now as a historical reference. Why does this anthology end with the invention of the World Wide Web in the early 1990s? It is telling that my intellectual hero of the digital age is an urban sociologist, Saskia Sassen. The canon of critical Internet studies has yet to be written, particularly as an academic textbook,⁹ but Mute Magazine's anthology *Proud to be Flesh* is certainly a good start. Who is bringing the radical critique of the networked world that has been developed over the past 15 years into other contexts? Will it in the end boil down to the mainstream concern that our brains and our bodies can no longer cope, and collapse under the pressure of information overload?

In response to this dead-end situation, young and ambitious thinkers deliberately avoid media studies, be it in film, television, or new media. Career-wise, it is better to position one's CV inside visual arts, sociology, or philosophy, or to specialize straight away on the history and discourse of print, film, and television.¹⁰ In this crisis era, the Green New Deal has taken over the role of future science from hard-core ICT, which, at least in the West, has begun to suffer from outsourcing and a bad gender reputation. Research funds flow instead in the direction of electric cars, wind energy, and the like. Rather than being celebrated as a hotspot for the cool, media studies is seen as a dumping ground for scattered, overworked mid-career academics who have many reasons to complain about lack of funding, inspiration, and lasting values. For many its "nerd" image is no longer funny. For those positioned inside shrinking humanities faculties there has been only one way to go – down a dizzying spiral into the maelstrom. The globalization of higher education and increasing competition between disciplines over diminishing funds and gifted students has only further exacerbated the sense of crisis in the adolescent years of new media education and research. In order to tackle these challenges we need to develop an art of "collective assistance" for growth spurts, because the next metamorphosis of the new media field is immanent even amidst the danger of conceptual weakness and uncertainty. Are the new media players in this climate of stasis ready for the next Great Leap forward?

Keeping Up with the Googles

Apart from the difficult institutional politics of new media research, another more general problem is rearing its head. We come to the third element of difficulty characterizing the state of the arts of new media within media studies: increasingly, new media research is running far behind the *Zeitgeist*, and has the tendency to write history instead of writing critical theory that can intervene in emerging processes. The timeline for academic research is so long and still so focused on book production that there is less and less room for real-time interventions, let alone contributions from the arts and humanities to co-design tomorrow's technologies and societies. Twitter easily outpaces CNN and other global news agencies while social science and humanities research dropped out of the technological race ages ago. What is research in a real-time society? We can no longer run away from this question, nor sum up, yet again, all of the institutional restraints we're facing. Strategies used by hard sciences to acquire the largest investments in "fundamental research" are encouraging, but also wildly unrealistic, as they cannot easily generate immediate practical outcomes. Arts and humanities continue to suffer while the hard sciences, on average, claim 85% of research funds. Facing such a radical imbalance, it is hard to collaborate on an equal basis. Have all the ethical problems of CERN, data mining, and biotechnology been adequately confronted? Do we simply want to leave it to governments and corporations to patrol themselves? In this climate, can theory and aesthetics regain leading positions as visionary activities, whether positive or negative? How ironic that in times of much talk over the "creative city" and its "creative industries," the arts and humanities continue to get less and less money. Perhaps these are not the right strategies to prove one's engagement and the urgency of the topic and the approach. Wouldn't it be better to start doing untimely research?

In an email conversation, Henry Warwick noted the following:

Literally hundreds of media departments all over the planet are dealing with a similar dynamic. The idea that the analogue/broadcast/fine art regime is the centre of the game clearly no longer obtains, for in fact it's all been "componentised" and each are simply particular stripes in the broad media flag. As a consequence, "disruptive" theoretical concerns are pushed aside, ignored, or punished. The resulting precarity is accepted as "part of the game." [. . .] Meanwhile what's going unnoticed is that the turn of media as a matter of computability – in the face of cheap storage and increased bandwidth – has enormous and far reaching theoretical, social, political, aesthetic (and a host of other) impacts and ramifications. (Personal communication, June 6, 2009)

Talking to pioneers in new media education and research, one can witness a let's-wait-and-see attitude creeping in as Generation X comes of age; a culture of complaint infuses the conversation. The critique of neoliberalism and free market capitalism may be sharp and correct, but underneath we hear tired voices. After 10 to 15 years of hard work spent building up digital and interactive programs, many

lost their vitality and are no longer able to make bold initiatives that break new ground. A defensive mode kicks in. Should one aim for greater institutional recognition or see institutionalization *per se* as a source of the stagnation? The system is crushing spirits that have only been rewarded with a few crumbs. The “digital” faculty is new, usually untenured, and not backed by professorships or PhD programs, and, as a consequence, their positions are precarious. They are “built to flip,” as they would say in the late 1990s. The underlying assumption is clear: newness will not last; as a fad the digital will fade. The structural precarity that sets in as a consequence is threatening and unwelcome, especially as the obvious work of dealing with spouses or partners who also have careers, raise kids, and pay mortgages comes into play. What is lacking is a long-term vision that these fields will become powerful, an idea that is frightening. Neither going for the big ride on the back of capital, nor for the radical refusal, new media artists, programmers, and critics are confronted with diminishing opportunities while the field at large expands far beyond their reach. What and where is the expertise? If we are to escape from this stagnation, we must locate the rotten, ineffectual parts and practices and cut them out before we open the collaborative wikis. It takes a radical change in culture to stop thinking as a default response in institutional terms. Is theory itself, with all the baggage it entails as a term, a necessary core element of the work to be done?

Media Studies in the Netherlands

Let us zoom in further on the Netherlands where the “new media” departments in Utrecht and Amsterdam are fighting uphill battles of their own. With few exceptions, the national academic research grant-giving body NWO has failed to earmark new media (from an arts and humanities perspective) as a priority. This is the main reason academic new media programs in the Netherlands remain tiny compared to the booming vocational schools within the universities of applied sciences (*hogescholen*), which were actively supported to start separate degrees aimed at high enrollment growth. Instead of expanding to match the pace of the growth of the Internet (including games and mobile telephony), these academic new media initiatives had to push themselves into existing departments that were less than excited to support a competing program in times of shrinking opportunities.

The anthology *Digital Material* (Van den Boomen, Lammes, Lehman, Raessens, & Schäfer, 2009), presented in May 2009 to celebrate the 10-year anniversary of media studies in Utrecht, does not claim to have a program either.¹¹ It merely proposes a summary of the Media Question in the form of the pragmatic and rather artificial concept “digital materiality.” Basically, the common point of differentiation is in the method and approach, not in the platform. Even the divergence of research is celebrated as heterogeneous (much in the Rosi Braidotti fashion), and keep in mind that there is no Utrecht or Amsterdam School of New Media Research. While some praise

this lack of unity, others see it as a lost opportunity, in particular for the countless students who must leave the country because there is still no new media PhD program or even a research master's degree in the Netherlands. If we want to keep new media small, then create multidisciplinary teams with dispersed interests – divide and conquer. What we now have is a slowly expanding, haphazard cloud of scholars, doing interesting but comparatively unsupported work in light of the magnitude and potential societal implications of the field. How will new media research leave this vicious circle and make the quantum leap to catch up with society?

What we lack is the capacity, or the collective will, to set up bold and coherent programs, departments, and eventually entire schools based on future scenarios that could make an all-too-obvious claim: all that is digital and networked is going to be with us and will not disappear overnight. Nevertheless, if new media programs are to assume their critical function we must demand a space to build up exactly such bold initiatives. We should note positively the increased interest in new media tools and methods (for instance Richard Rogers's Digital Methods Initiative in Amsterdam and Lev Manovich's Cultural Analytics in San Diego), but in observing current technological development, this interest is hugely undernourished. Furthermore, tools and methods are a far cry from the vision that is so sorely needed in response to the question of where to take new media studies as a whole. The method is the message. Let's turn now to proposals from within the field itself.

The Quantitative Turn

The “quantitative turn,” perhaps the most current and co-opted “best answer” put forth by media studies, does not present itself as a program; at best, it is a clever response inside digital humanities to understand and utilize the latest technological affordances. If we say “text has become searchable” and “images have become computable” it means that we can explore another layer of knowledge, namely patterns that become visible in comparison to other works. This comparative approach puts the work in a larger context that transcends unique expression. The work of Adorno and Horkheimer shows that quantitative research, such as the Princeton Radio Project, and qualitative analysis, such as the *Dialectics of Enlightenment*, can very well be done by one and the same person. There is no decision to be made here. While there is no obligation in cultural analysis to use tools (and is it even uncertain that the research results of data mining and info-visualization will be useful at all), we should note the process of tool development as cultural prototyping beyond good or evil. Many questions still remain. Do we need these tools to understand wider trends? Are there other ways to think globally? Why do we need large data sets and patterns in the first place? Is there indeed a crisis of the “readability” of society? Previous generations thought that they could decode the signs of the times through a single novel, film, or song, but is this method still valid? Hasn't it become too easy

to instantly deconstruct the gender-race-class interest of the single-author work? It is just one opinion; why bother with only one judgment (or symptom)?

The uncertainty over the status of any single cultural expression in mass society has further fueled this trend toward “the larger picture.” According to Alex Galloway,

the crisis revolves around the social sciences and the collection of data, the so-called “quantitative turn.” Scholars used to have a monopoly on the collection and interpretation of information. Today that job is performed by Google, Monsanto, and Equifax. Scholars today are outspent and upstaged by industry. Because of this, the very concept of media studies needs to be scratched out and rethought. The irony of course is that the universities are precisely the place where this will never happen, given the conservative nature of these kinds of institutions. It is the poverty of academic life. So shall we supersede the academy? (Personal communication, June 9, 2009)

Whereas in the roaring mid-nineties there was a glimpse of hope that a new media bohemia could take up the role that Galloway points to, the dotcom wave all but strangled independent theory production. In such an environment as exists now, how do we best utilize the ever-widening range of coding practices, from unconferencing to barcamps, from bricolabs to book sprints? Do we really accept that the highest levels of expertise are locked up behind the doors of Google, Monsanto, and Equifax?

Can the quantitative or computational turn revitalize media theory? According to Manovich:

While I am certainly very excited about the range of new possibilities it offers, and that’s why I was putting all my energy over the last two years in “cultural analytics,” I am not sure about the answer to this question. First of all, it will be about ten years before people who study media will be ready to take up this approach. Second, it has to be combined with another major conceptual shift of the study Culture as Everything Being Created By Everybody, as opposed to selected objects and people who are thought of as important for particular reasons. This is really a very big paradigm shift which I am not sure will happen. Without it, we will simply continue with digital humanities as they have been practiced in literary studies already for two decades – analysis of style and historical patterns but only in important “literary texts.” (Personal communication, January 1, 2010)

Outlook Toward a New Program

Instead of time and again trying to enforce the paradigms of film and television studies onto new media, we could also turn to other disciplines that have been overlooked in the process. For some that would be computer science and mathematics. For Manovich, it’s design:

The key to development of a self-sufficient theory of software culture, or whatever we want to call it, is taking design seriously. Since in general design is ignored, the academy leaves out something like 80% of contemporary culture. If the academy starts taking design seriously – graphic design, web design, interactive design, experience design, software design and so on – this can also lead to looking in detail at concrete hardware, software, and web apps – analyzing their details as opposed to seeing them through the glasses of “high theory.” (Personal communication, January 1, 2010)

Also instead of creating artificial mergers, Matthew Fuller and Andrew Goffey (2009) have proposed the intriguing “Evil Media Studies,” not so much as a discipline but as a “manner of working with a set of informal practices and bodies of knowledge,” which they have characterized as “stratagems.” They suggest the following possibilities:

Bypass Representation, Exploit Anachronisms, Stimulate Malignancy, Machine the Commonplace, Make the Accidental Essential, Recourse Stratagems, The Rapture of Capture, Sophisticating Machinery, What Is Good For Natural Language is Good for Formal Language, Know Your Data, Liberate Determinism, Inattention Economy, Brains Beyond Language, Keep Your Stratagem Secret As Long As Possible, Take Care of the Symbols, the Sense Will Follow, and The Creativity of Matter. (Fuller & Goffey, 2009)

These programmatic statements can be used to counter corporate literature, academic conventions, and other self-satisfied statements about how beneficial “media” can be (but actually aren’t in the messy reality of everyday life).

Evil or not, it is time to leave behind academic constraints and open up collective imagination. It is time to cut back conversations on local limitations and see what the common goals are. There are more than enough tools and platforms available (though few know how to use them fluidly). All too often we constrain ourselves according to “their” rules in the naïve belief that a positive attitude on our side will enlarge the room for negotiation. In no case is this clearer than when new media theorists, artists, and activists are faced with tight intellectual property rules enforced by academia and the corporate publishing industry. What we see happening is subversive characters blindly signing away all their rights to Sage, Elsevier Reed, and other publishing giants. Why? With the Open Access movement gaining such momentum, it makes you wonder when civil disobedience in this area will finally take hold and the cases of micro-resistance (which do happen) reach critical mass. It is time we say “no” to restrictive publishing contracts and organize ourselves. Let’s stop complaining and develop another publishing culture, one that is more up-to-speed with the times, and update how we ourselves think about our field. While not completely relinquishing the “brand” of media studies, McKenzie Wark suggests an alternative perspective for locating the developments of the field within the spectrum of history:

Having to always declare something is over is connected to refusing to historicize. There are two ways of situating media studies historically. One way is to see new media

as add-ons or extensions of old media. Start with cinema, for example, and position the new as same-but-different within this space of thought and disciplinary organization. The other way starts with the phenomena before us – games, mobiles, internet – how do they call into being entirely new (long range) genealogies? How do they call us to reject or revise existing histories? It needs to be allied to three methodologies: the conceptual, the ethnographic and the experimental. The mere reading of “texts” does not serve us well at the moment. (Personal communication, June 9, 2009)

Over in New York, McKenzie Wark intends to revolutionize media studies. “I am inclined to think it is an intellectual struggle within that space. The age of infancy is over, yes, and with it our innocence. Positioning an intellectual project is about resources, about picking fights, about finding allies” (personal communication, June 9, 2009). As part of this dialogue, Toby Miller, chair of Cultural and Media Studies at the University of California, Riverside, sees media studies dominated by three topics: ownership and control, content, and audiences. “Media Studies 1.0 panics about citizens and consumers as audiences, whereas Media Studies 2.0 celebrates them. I would prefer a panic-free, critical, and internationalist Media Studies 3.0” (Miller, 2008, p. 215). According to Miller (2008, p. 221), the old versions of media studies are tied to nativist and imperialist epistemologies that must be transcended. He proposes a Media Studies 3.0 that will blend

ethnographic, political-economic, and aesthetic analyses in a global and local way, establishing links between the key areas of cultural production around the world (Africa, the Americas, Asia, Europe, and the Middle East) and diasporic/dispossessed communities engaged in their own cultural production (Native peoples, African and Asian diasporas, Latinos, and Middle-Eastern peoples). Media Studies 3.0 needs to be a media-centred version of area studies, with diasporas as important as regions. It must be animated by collective identity and power, by how human subjects are formed and how they experience cultural and social space.

We need a global perspective for media studies as a productive force that goes beyond a mere study of new media’s impact in these places. New media should be seen as an integrated system where its users contribute to the vital core of the technology itself. This approach not only needs spiritual support but also needs to be implemented. The humanities perspective, for example, cuts deeper and addresses other registers. The critique here demands full autonomy (from BA to PhD programs, to put it in edu talk), before we can speak again of interdisciplinary collaborations. Another approach would be to develop new organizational forms altogether. What are the tactical resources necessary for contemporary “organized networks,” distributed think tanks, and temporary media labs to do their work? Much of the technical infrastructure is already at (y)our disposal – sometimes for free, and in other cases purchased for a handful of hard currency. Even though theory lays the foundation, this path can only be followed through with praxis. It is all about concepts, demos, betas, versions, and meeting face to face, which is the most precious and expensive part of the operation.

According to German media theorist Florian Cramer, who teaches and conducts research at the Rotterdam Piet Zwart Institute, it is one of the terrible legacies of media studies to play the prophecy/futurology game. According to Cramer,

people like Marshall McLuhan and Norbert Bolz had their side-careers as highly-paid media industry advisors with their “visions” of a future communication culture. Media art as it’s featured from Ars Electronica in Linz to STRP in Eindhoven still get away with coloring rabbits or producing expensive, non-working tech art junk at art media labs because it somehow could be the vision of future media (although it never managed to be) and still claims national subsidies. (Personal communication, September 16, 2009)

What we really need, says Cramer, is critical studies of the contemporary uses and cultures of electronic and digital information technology.

Let’s not call for Media Studies 2.0, or 3.0, for that matter. We are not talking about a next generation, let alone a mere upgrade of the current institutional setup. The main players within media studies do not need to be informed about the potentials of Web 2.0; we have to presume they are well aware of the possibilities. This is not the time to put demands on the table of Those Who Rule. What we need to do is reimagine the social modes of philosophical inquiry itself. Too much energy has already been wasted on the question of how “new media” could possibly fit into institutional arrangements. An entire generation has lost the way in a confusing uphill battle through the institutions, while the world’s frisky vitality has gone digital. What do we have to show for all this expended energy? Are computers and the Internet absorbing so much creative libido that there is little left to change the bricks-and-mortar in which traditional life took place? What happens if we cultivate more self-awareness amongst new media theorists and practitioners? What happens if we place ourselves as actors in the New Media Saga and relate to neighboring media technologies in a frank and ultimately sovereign manner?

ACKNOWLEDGMENTS

Thanks to Matthew Fuller, Alexander Galloway, Josephine Berry, McKenzie Wark, Toby Miller, Florian Cramer, Mirko Tobias Schäfer, and Lev Manovich for their dialogues with the text-in-progress and also to Henry Warwick and Tim Syth for their editorial support.

NOTES

- 1 The “Ends of Television” was the title of a UvA Media Studies conference. See <http://www.mediaudies.nl/vv-conferenties/conferenties-organisatie2006/End%20of%20television.html>

- 2 University of Utrecht Media Studies teacher Mirko Tobias Schäfer disagrees: "Serious scholarship would concern itself with analysing the metaphors. I am afraid that the constant attempts to keep up with the 'marketing machinery' produces poor research, and will identify wrong, inappropriate objects of research" (personal communication, September 18, 2009).
- 3 According to Florian Cramer, "This is already happening. If you are a scholar and you only publish online, you're lowbrow; if you publish books, you're highbrow. If you are a filmmaker and you have a theatrical release on 35 mm, you're highbrow. If you release on YouTube, you're lowbrow" (personal communication, September 16, 2009).
- 4 This is the thesis of Jordi Wijnalda, "What is Film? Manifesto for a New Film Analysis," *Xi*, 17(4), p. 6, in the student quarterly of media studies at the University of Amsterdam, April 2009 (in Dutch). Wijnalda rejects "grand theories" and calls for greater selection in the choice of theoretical frameworks. She calls for a renaissance of film aesthetics, against one-dimensional approaches that reduce film to text. In short, critics need to show more respect for their object of study. Film speaks a different language, set apart from other art forms and media.
- 5 An alternative history of media studies would point to the Macey and Bateson conferences and other sources from the history of cybernetics. However, written media archaeologies have not yet sufficiently incorporated these sources, and media studies is more often perceived to derive from 1970s film and theater efforts (to leave aside the social science references of media and communication).
- 6 The Wikipedia entry on media studies is an interesting case illustrating how poorly defined media studies is at the moment. See http://en.wikipedia.org/wiki/Media_studies (accessed July 25, 2012).
- 7 In his pamphlet *Media Studies 2.0*, David Gauntlett observes how amongst media studies 1.0 programs there is a "vague recognition of the internet and new digital media, as an 'add on' to the traditional media (to be dealt with in one self-contained segment tacked on to a Media Studies teaching module, book or degree)" (<http://brianair.wordpress.com/film-theory/medi-2-0-thought-provoking-mainly-for-staff/>). See also Gauntlett's forum at <http://twopointzeroforum.blogspot.com/>
- 8 Florian Cramer has noted: "The problem is that the humanities, in their orientation towards canons, are never interested in producing short-term input or knowledge. If you write a Ph.D. dissertation or monograph, you will, as a scholar, always choose a subject that will ideally ensure your eternal reputation and yield 'timelessly' valid criticism. This is true for all the landmarks of modern criticism, from Walter Benjamin to Auerbach's 'Mimesis' to Northrop Frye, Harold Bloom etc. With that goal, you will never write a book on Twitter – every professorial advisor would warn you that it would be outmoded when it's done and ruin your career. This is why the humanities are structurally conservative and not interested in cutting edge cultural issues" (personal communication, September 16, 2009).
- 9 Mirko Tobias Schäfer emphasizes the need to call bad research, poor teaching, and incompetent administration by its name, and not to blame media studies as such for the current situation. "Students are taught poorly; TED talks all of a sudden are mistaken for an academic conference; blog posts are quotes as if they were papers and comments are over-estimated as peer review. Visibility and attention become the new academic merits. Checking the blog-roll of so-called academic blogs is interesting; they are full of popular and admittedly witty conference speakers, but links to First Monday, Arxiv or others are rare" (personal communication, September 18, 2009).

- 10 According to Florian Cramer, “If I had happened to father a child at age 21, it would graduate from high school right now, and I would – if asked – give her or him the strong advice to study, rather than media studies, philosophy combined with informatics and literature or art history. It’s a schizophrenia that’s embedded into the whole field. All good media researchers have studied classical humanities, and I do not know one good media scholar who has graduated in media studies. The problem of studying media theory is that you’re typically educated on a second-rate theory canon of McLuhan and everything that makes up the standard media theory reading lists” (personal communication, September 16, 2009).
- 11 See also http://www2.let.uu.nl/Solis/ogc/agendaitems/10th_anniversary_new_media.htm. The idea for this essay grew out of a short presentation that I did there, together with Florian Cramer, in which I proposed the exodus of new media out of the broadcast context of film and television studies.

In Praise of Concept Production

Formats, Schools, and Nonrepresentational Media Studies

Geert Lovink and Ned Rossiter

ABSTRACT

In this chapter, Lovink and Rossiter argue that the field of media studies has yet to develop a theory of itself. Audience studies investigated fandom and the production of meaning, textual analysis preoccupied itself with signification processes attached to content, and political economy turned its gaze on institutional power. Medium theory, while close to the authors' own interests, still falls short, they argue, because it never changed the dialectic between old and new media or gave the relation a productive twist. Medium theory established a continuum between old and new media without considering how the media form itself gives rise to the production of new concepts. Media studies desperately needs new concept production, the authors argue, based in both online and face-to-face collaborative efforts. To develop new concepts, media researchers should begin with some reflexive mediation, examining how they use their object of study in the research methodology itself. From there, Lovink and Rossiter advocate moving the agenda beyond the analysis of visual representation to mobile media, miniaturization, smart technologies, and the integration of media into urban environments.

What does it reverse or flip into when pushed to the limits of its potential?

(Marshall McLuhan, *Laws of Media*, 1988)

I have seen the future – and it's not visual.

(Johan Sjerpstra)

During the first decade of the twenty-first century the academic discipline of media studies failed to develop a compelling agenda. Media turned out to be empty containers, individualizing people rather than facilitating collective agendas. The growth of “media” could lead to their ultimate implosion. If “media” have gone digital and become the network glue between devices, there is a danger of defining the boundaries of media studies purely for the sake of the discipline itself. Media studies then becomes self-referential, defined solely in terms of its self-defense against predatory competitors. For instance, if media cannot be distinguished anymore from urban life, geography, and location-based services, then what is the task of media studies? Public relations is a trap here: to study media is not identical to its promotion. We need media researchers to reflect on how they use their object of study in the research methodology itself. In a media society of compulsive immersion, this is no easy task. Indeed, many would charge such a call as regressive, harking back to the Cartesian myth of critical detachment. But as we will argue, we consider the work of reflexive mediation – of concept production – necessary if such a thing as media critique is to exist at all.

For the past decade media studies has struggled to keep up with the pace of technocultural change. The methodologies and concepts of the broadcast era of “mass media” are of little use when analyzing networked digital cultures. The globalization of higher education and the increasing competition between disciplines over diminishing funds and international students have further exacerbated the unconscious crisis of media studies. With a push toward vocational training, stagnating cultural studies, and a distaste for theory in general, film and television studies can only make defensive gestures toward the ever-expanding digital realm.

The future of media studies rests on its capacity to avoid forced synergies toward “screen cultures” or “visual studies” and instead to invent new institutional forms that connect with the trans-media, collaborative, and self-organizational culture of teaching and research networks. Unless media studies makes such a move, it will join the vanishing objects it assumes as constitutive of media in society. In this essay we want to go beyond an inventory on the state of the art and use the example of *organizing networks* as a concept in development that might revitalize education and research in this field. The work of organizing networks, a concept proposed by us in 2005, involves the invention of new institutional forms immanent to communications media.¹ Such a collaborative process, mediated through network culture, conditions the possibility of disciplinary transmutation.

Database Dating and the Invention of Schools

A school is defined as a critical mass of equal-standing scholars and teachers with distinct intellectual traits. The question on the table is how to develop decentralized “global” (public) research schools and identify what their key features might be. The current “science” system expects collaborative research but does not facilitate the formation of distinctive schools of concept production. Humanities scholars have learned to play the waiting game of drip-fed funding, locked in the holding bay of a terminal with no interest in supporting experimental research on a distributed, trans-institutional scale. The Internet has, surprisingly, not made much of a difference. One could blame the structure of research funding and related academic publishing rituals for this, but that is a weak proposition since it assumes a form of structural overdetermination. A general culture of indifference toward the relation between media environments and conditions of concept and knowledge production prevails in a more pervasive way. Has the (neoliberal) individualization of society increased our fear of long-lasting collective commitments? If “schools” are so influential, what stops us from creating them?

Instead of conceiving a multitude of schools and approaches that theorize the turbulent transformations in the media sphere, the collective production of concepts has been a decidedly tame affair. There are no institutional examples of new media research agendas, collectives, or schools. Where is the Frankfurt School of our time? All too soon we seem to reduce collaborative efforts to fashions in theory. No matter one’s critiques of the Frankfurt School, the fact is it produced a lasting legacy in the field of media studies and cultural analysis. Despite its identity as a school, the work of individuals stands out: Benjamin, Adorno, Horkheimer, Marcuse. But a counter-reading would say it is exactly the distributed intellectual labor of the Frankfurt School that allowed these extra-institutional figures to become part of the canon of critical theory and social philosophy. It is the self-organization of a group of intellectuals to create a school across national and transnational spaces that inspires us here.² Much of what is now called French theory has been produced in similar circumstances, outside or on the fringes of academia, creating a delicate balance between individual work and intense exchanges within a social milieu of intellectuals, artists, and activists. A similar story can be told of Italian post-*autonomia* political philosophy and the earlier schools of Freudian psychoanalysis. Media studies desperately needs its own versions of these distinct, collective intellectual efforts.

Is global media studies something for the future? That is not the direction we would advocate, at least in terms of how it is currently defined. Global media studies emphasizes cultural competence and an awareness of cultural differences derived, in some cases, through media ethnography. For the most part, global media studies is driven by conservative methods of content and discourse analysis. Frequently it stays within the UK audience studies approach to media research and is, at best,

Commonwealth in its focus. Certainly, there is research on the political economy of global media, though here the cultural question is frequently left out. And it plays into very weak empirical attempts at a political economy of so-called “global” media industries, which in reality are more often regional at best with the rise of “national webs” bringing even the regional scale of media culture into question. In short, global media studies is a concept-free zone without transnational connection or inter-scalar complexity. There is no coordinated network of global media researchers working in any sustained manner on the undulations of contemporary media cultures. The old association form of grouping international researchers around particular disciplines is certainly not the model that is going to provide the distributed labor required today for research practices immanent to the media of communication.

Traditionally renowned as the dream factory, the United States in particular has demonstrated an inability to create collective academic projects and facilities for long-term collaborative work in new media research. In fact, the world over, the current research model is one of a “principal investigator” who hires assistants, postdocs, and PhD students with the sole aim to demonstrate “leadership.” What characterizes media studies, in sync with the global neoliberal context, is the figure of the lone researcher. If research funds are realized, content might consolidate within the logic of reporting and listing of outputs. But if the money doesn’t come through, it can be very hard to materialize research, at least within the academy. While a plethora of “tactical media” interventions over the past 10 years suggests a healthy state of media invention, these are not instances of collective production at a disciplinary level of institutional support, infrastructure, and commitment.³ Rather, the academy’s preference is for silo construction that engenders, at best, interdisciplinary innovation around intellectual property regimes (IPRs) as distinct from transdisciplinary invention through free collaboration, and remains the model of the singular author-producer.

Perhaps teamwork’s violation of the sacred author as individual explains why science’s collaborative methods are *de facto* not allowed in the humanities – despite the fact that the “science” model is promoted so heavily as a cultural model. The sciences long ago recognized the collaborative function of knowledge production, and a key part of this stems from science’s old collaborations with industry, requiring the field to traverse institutional expectations and logics of production. But if we look at a case like Australia where “industry linkage” grants in the humanities have been the norm for over a decade, this structural change has not had any sustained impact in terms of materializing meaningful collaborative research practices.⁴ In the end these are only formal relations on paper and not lived relations in any substantive sense in terms of disciplinary invention. Moreover, they are top-down arrangements driven by government policy directives on obtaining funds within a populist and economic political paradigm. It is no surprise that Aussie academics drifted toward industry linkage grants out of simple cynical opportunism along with a desperate survival instinct, a few exceptions aside. The so-called industry partners are often just neighboring governmental bodies such as cultural and media organizations and government agencies. The “linkage” is largely symbolic and institutionally, not research,

driven. The aim with linkage projects is to legitimize already completed research and to create an institutional framework within which to justify career futures. Meaningful and inventive research collaborations cannot materialize in such arrangements when they start with these kinds of forced relations.

The database approach to finding research partners within the European funding system is not much different. Academics in search of research partners plug in their expertise details, disciplinary training, and project interests, press submit, and the database builds a field of partner options. Within the Framework Programmes (FP), researchers are effectively forced to work together in order to have a shot at funding, and the database serves as a mirror of TV dating games where contestant profiles are the basis upon which a “perfect match” is conjured from the abyss of isolation. It doesn’t help that researchers are quietly advised to lobby in Brussels for collaborative European Union (EU) research money if they wish their projects to have any chance of obtaining funding. With assessors holed up in hotels in Brussels reviewing a thousand applications over a few days, it is no wonder that they pick their buddies out of the stack. Such a massive scale of applications in the European system leaves little choice other than a corrupt culture of cronyism. While efforts in public relations might improve the signal/noise ratio with decision-makers, it is very hard to see how it assists the work of collaborative research, assuming your project even has the capacity and resources to enlist an Ad Man. Instead, this model of research becomes indistinct from contemporary political campaigns, where special interest groups lobby the centers of power and all the while the project moves further away from the objects, methods, and passions of research.

In sum, the academy’s closed intellectual property regime logic, its centralization, and its habit of database dating is thoroughly disconnected from new media environments characterized by a culture of open communication and collaboration. Among countless current examples of this are open courseware (from MIT to Edu-Factory), open publishing (online journals, collaborative blogs, etc.), and open software movements (openstreetmap.org, Linux and all its variants). Crucial here is the connection between online communication and material situations. Whether it is barcamps, collective field research, or group planning meetings, the offline element is central to the work of organizing networks. To be purely “virtual” is to risk drifting potentially vital concepts into the realm of vaporware. The material dimension functions to galvanize online activities as a substantive force.

Successful instances of disciplinary collaborative research can exist. We are reminded of the science and technology studies (STS) method, in which anthropologists and sociologists approached science with questions. Why did it work? Driven by initial questions around health, environmental, financial, and medical issues, STS was a research-driven approach to knowledge production, very different than the self-referential tendency in media studies to avoid rigor and instead produce texts based on the endless citation of peers with power. STS provides an example of how the material world forced the disciplinary contours and methods of STS to adapt, evolve, and consolidate. STS managed to develop the skill of translating issues that

emerge in society into legitimate and necessary research programs free from client-driven research. While media studies too often remains beholden to the abstract and frequently politically motivated research focus areas set by funding agencies, it could embrace the culture of collaboration special to networks and design new models of autonomous research funding.

The Media Question and Organized Networks

Regrettably, after a short renaissance of Anglo-Saxon cultural studies in the early 1990s, the Media Question no longer sparks the collective imagination. Abundant fragmentation has distracted us. Why do we even bother with the fate of media studies? What is really so special about it? Certainly we have our own intellectual affinity with various figures – Innis, McLuhan, Mattelart, Castells, Kittler, and so forth. But this says more about attractions to style and modes of analysis than disciplinary *per se*. We would also have to admit to a fascination with the magic of mediated relations and the marvels of technical invention. But what drives us is the Media Question, still unresolved at the level of architectural control, the production of standards, and management of protocols – all things we see as collectively produced and in fact unrelated to the routine and very dull fare that usually defines the territory of media studies: representations of marginality, textual and content analysis, and identity politics.

The direction of media studies must therefore be nonrepresentational. While for the time being “media” remains what it has been, a container concept, we know from the work of medium theorists that the container is a very elastic form of the materiality of expression. Media never cease to surprise or generate unusually high levels of excitement and forms of mass participation. In this respect, media are always social, and so too is the materiality of form. The focus should, for instance, be on integrated urban-media environments, smart technologies, ubiquitous media. As a social-technical phenomenon, then, communications media are always alive and therefore changing.

In contrast, what makes media studies so boring and predictable is its slowness and obsession with the visual. No matter how fast the transmission of signals, the distribution of academic knowledge is inherently slow. Think of book publishing and how you wait two years for the text to appear. The cost of printing books in China is cheap, but shipping containers still take 2–3 months to reach the other side of the world. If key publishers embrace print-on-demand some of these obstacles would be addressed. And it is truly unforgivable the way publishers charge upwards of £100 for monographs. Authors should also know better and take a closer look at their contracts before they consign their hard work to the remainder shelf and pulping machines at the expense of being read in a timely way.

Media studies hasn’t taken its objects seriously enough. All too easily it borrows from the shopping mall of postmodern theory, psychoanalysis, sociology, and literary

studies to interpret its own object, neglecting the challenge to develop media theory itself. The insane subject provides the raw material and object for concept production in psychoanalysis, for example. So why should it be so difficult for media technologies to function as the object of concept production? To think that they can't is to seriously regress and suppose that media are simply empty vessels or black boxes waiting to be filled – the container theory all over again – rather than remarkable objects with their own capacity for inspiring concepts. Where, then, should media studies find its concepts of renewal? What are the geocultural contours and institutional settings best equipped to support collaborative concept production that will most likely happen outside the academy?

Let us be clear: concepts are essential for a vibrant and distinctive media studies discipline. They are not produced for their own sake but because they hold the capacity to transform society in profound ways. Think of the Freudian-inspired work of Edward Bernays and the rise of public opinion and advertisements of consumer fantasies in the United States after World War II.⁵ The experience of life and the production of subjectivity underwent enormous changes once the concept of desire was integrated into the media imaginary of postwar society. Consider also how the Obama 2008 presidential campaign drew heavily on both traditional grassroots political strategies and organizational concepts developed out of social network and activist media such as swarming, viral marketing, and self-organization, resulting in a post-party production of the Obama brand. For these reasons, we think there is great importance in developing distributed, collaborative research agendas that invest in analysis by way of practice to produce concepts in the digital era.

One approach to addressing the need for new modes of association and collaboration in media studies is to experiment with the model of “organized networks” to institute media research within an informational, digital paradigm. Such a move would further disaggregate the already crumbling system of the modern university. Critics might contend that organizing media research within the culture of networks would simply reinforce the neoliberal drive to outsource the provision of services. One could also argue that a move toward organized networks would be precisely at odds with the idea of institutional security necessary for sustainable practices of knowledge production. But in our minds there is an important distinction between service provision and knowledge production. The former is driven by the market impulse and is underscored by disinterested (“alienated”) labor within highly precarious conditions of employment. While the latter is not without similar precarity, and indeed in the age of “digital diploma mills” shares much with service provision (Noble, 2002), the work of knowledge production in the age of digital networks nonetheless holds both affective and material qualities of a special kind, quite unlike so-called knowledge production within universities, where social relations are as hierarchical and atomized as those found on the nineteenth-century factory floor.

Social relations within and across networks tend to be fleeting and project driven, struggling for continuity. Similarly, at a material level the technical standards of much online knowledge production tend to result in a proliferation of platforms and sites,

which has the effect of further disaggregating what might in fact at the social level be a series of projects shared by a number of participants distributed across transnational spaces and times. This leads us to another key concept for knowledge production in the age of networks: seriality. Where standards, sites, and participants appear fragmented, the concept of seriality helps establish connections across otherwise seemingly unrelated phenomena. Tools and methods need to be developed that assist researchers, participants, and user-viewers in their efforts to keep track of multiple projects distributed across space and time. This requires more than a real-time software fix. Take Google Wave, for instance. According to the Wikipedia definition, “Google Wave is a web-based computing platform and communications protocol designed to merge key features of communications media such as email, instant messaging, wikis, and social networking. Communications using the system can be synchronous or asynchronous.”⁶ The problem here is not so much the baroque *combinatoria* of data streams but the standardized automatic results these dashboards generate to instantly solve the all-too-human noise of collaboration. Aggregation is not the answer for meaningful collaboration, since the productive and indeed often charming differences that define research projects online tend to be erased when incorporated into a real-time aggregation platform. Networks thrive on not-working and communication gaps (Lovink, 2005). Special qualities of different communications media need to be retained rather than aggregated to best sustain serial relations across diverse networked projects that refuse incorporation by any single power or authority.

Concepts Beyond the Classroom

There also remains considerable work to be done concerning the relationship between research and teaching in media studies and, indeed, across the disciplines overall. Moreover, there is great potential to generate concepts in the research-teaching “nexus,” to adopt the managerial parlance. But this work of concept co-production should not be technologically determinist or have too much faith in technology alone. Like the “ICT for development” discourse, which assumes the introduction of technology into developing countries results in economic transformation, there is a broad feeling that technology makes teaching better. Nevertheless, a 2010 report noted that the vast majority of academics in the United States continue to resist adopting technology in the classroom (Young, 2010). For us the issue is not so much one of mass conversion to high-tech education (the students come to class prepackaged with a digital default anyway, even if their professors do not) but of translating research practices from the wikis, collaborative blogs, project-based learning, and media production that many of us already engage in for pedagogical purposes. In other words, the use of digital media in the classroom already assumes a process of research: one has to learn new software, techniques of information

retrieval and recombination, social protocols of communication, and so forth. Moving such practices into a paradigm of teaching-as-research requires translation, which in this case is a collective political task across institutional settings that at once formalizes and consolidates teaching and research through the development of new methods, models, and concepts.

Instead, what we find within the techno-institutional economy is research that excludes teaching, thereby retaining the distinction between the two. Moreover, media studies is positioned as a disciplinary practice of education rather than research. Within the circumscribed borders of the informational university, media studies has no distinct object of study. The object of media studies is not media; it is audiences, textual analysis, and content analysis coupled with a vocational element. Media studies for most students is a means to an end: the job. Analyzing the process of learning itself is very rarely embraced and requires a good teacher. Students, broadly speaking, are terrified by the sea of uncertainty that defines the labor of thinking and, therefore, research. They want signposts installed at every point of the learning process, and academics willingly supply students with ultimately false rules of certainty in preparation for good end-of-semester teacher performance surveys required to hold onto the job. This situation of pedagogical failure and disciplinary stagnation is hardly helped by academics whose sole aspiration at an intellectual level is to publish unread articles in the journal stables of Elsevier, Sage, Springer, or Taylor & Francis. Journals held by such publishers are the pillar of legitimacy in the field of media studies and can be read without ever finding a concept. They are exercises in producing work that is largely indistinguishable from one article to the next. To put it very bluntly, the biggest threat to the future of media studies is the university itself.

The more recent work of Lev Manovich serves as one point of departure toward reinventing media pedagogy and concept production (Manovich, 2008). Manovich frames his book *Software Takes Command* with the following question: "How does the shift to software-based production methods in the 1990s change our concepts of 'media'?" (p. 25). Emphasizing the digital proliferation of visual material in contemporary life, Manovich foresees an accompanying crisis in critique. Where previously existing relations between critical approach and media form provided a sufficient architecture of intelligibility (think of psychoanalysis and film, for example), the abundance of digital culture today has yet to establish analytical models and relevant concepts with which to make sense of the hyperspeed of status-update culture. Teaching semiotics to your undergrads is not really going to help much when it comes to explaining the proliferation of YouTube videos, file-sharing sites, and social networking updates.

How to transform the culture of existing education institutions so that teaching is positioned as a generator of – rather than separate from – research presents a very particular set of obstacles. Part of the problem is that digital culture is so highly unstable. One of the key reasons the nineteenth-century novel could obtain canonical status and help invent the critical field of literary studies was because generations of scholars were able to refer to and debate the minutiae of plots unfolding across

individually produced pieces of content situated in the logic of an author's oeuvre. But this is not the case for digital culture, which is technically prone to collapsing code as programs are collectively rewritten and made obsolete with the latest update.

This technical characteristic manifests in social and cultural realms. For instance, there are no institutions beyond the idiosyncratic media art museums here and there that archive the Internet's inherently unstable medium. Certainly there exist a scattering of online archives such as the Wayback Machine,⁷ and indeed one could argue that competing platforms of search engines produce more than enough results for the networked masses.⁸ But we are talking of something quite different than the algorithmic organization of hits and links. The production of concepts for analyzing digital media culture cannot exist exclusively online with all its social-technical ephemerality, economy of upgrades, and tendency toward high levels of distraction. On-the-ground institutional infrastructure that supports critical digital studies is required for sustained research agendas, the formulation of curricula, and support staff.

The next problem is that newer forms of teaching are assessed through managerial audit regimes obsessed with the self-referential and thoroughly time-wasting exercise of "quality assurance control." Those who do bring technology into the classroom often find and even willingly embrace a teaching process contained within institutional software systems – Blackboard, WebCT, and internal wikis are key culprits. As a consequence, teaching practices and content are not exposed beyond the borders of the institution and therefore not assessed by a world of peers at large.

A final problem of a practice-based approach is that it all too easily replicates the visual elements, hegemonic language, and software behaviors of its own tools. Critical concepts also do not just emerge out of practice. Teaching how to develop one's concepts should be distinguished from the techno-commercial skills to master and localize media. We see this so often in new media education: importation of hyped-up concepts from California and customizing them to make viable successful products. This sense of localization is indistinguishable from the publishing giants Sage or Taylor & Francis offering teachers the opportunity, if they pay, to remix a course reader from their database.

Could we engage "Digital Humanities," with its separate IT staff who will deal with the technical details for clueless arts and humanities scholars? The concept of Digital Humanities might be useful for retiring linguists but is deadly for the media studies environment. The humanities itself should try to overcome its distance from computer science and attack the sciences head on for its privileged position in terms of funding. Digital Humanities maintains to be working in collaboration with computer engineers but the problem is they retain a classic division of labor, which totally goes against transdisciplinary knowledge production. What we need is to move away from expert-dependent high-end tools to broad-based undergraduate programs. We do not need massive budgets, but the Digital Humanities only work with high-end institutions and hide themselves behind the smoke screens of large data sets. The

“digital” is revolutionizing humanities itself and should not be downgraded as servitude to the IT staff and their authoritarian imaginations.

Mavericks, gurus, consultants, entrepreneurs, futurologists, and public intellectuals all trade in viral memes, but these are mostly bubble concepts that slide nicely across the PowerPoint presentation and are not connected in any material way to media research. This idiom of “concept-lite” derives from a lively and healthy publishing industry in business, management, and trade press – a postwar phenomenon that corresponds with the rise of consumer society and emergent postindustrialism. This extra-academic discourse is powerful precisely because thought becomes abstracted from material conditions. And at the level of visibility if not readability, it is very hard to ignore this literature – it can be found at every airport, yet it rarely appears on course reading lists.

Can we turn instead to innovative startups? Most of the work inside young companies involves the localization of existing realms of knowledge and commodity consumption, comparable to academics’ endless reviewing, quoting, and copying of existing work under a banner of “creativity” that suggests otherwise. Both fine-tune marketing and research paradigms around already existing knowledge. Similarly, in open source software development Linux is the basic platform and customization follows. The system itself is not transformed, but simply copy-pasted and then slightly altered. The rise of interconnected, integrated adaptation and localization of a handful of styles and ideas is preventing radical concept development. Where in this constellation described above that claims to be focused on critical, creative, innovative concepts does “research” fit in? Maybe research better positions itself in the tinkering, do-it-yourself corner of adaptation. The challenge is to organize “research” as forms of collective production and to modify existing research practices so a transformation can take place. This is what we must explore: “becoming a school.”

So where does one turn to for concepts – the crystallization of ideas as frameworks for analysis? Media studies’ future will only be guaranteed by the learning, teaching, and research of media taking place outside the academy, where it can turn instead to artist collectives and activist groups experimenting with and developing concepts for collaborative learning – concepts that can then be brought back into and applied in a classroom situation. The same could be said for many other disciplines – performance studies, art and design, and so on. But somehow these disciplines have not become inherently dull in the way that media studies has. Given the choice, we would jump at the opportunity to work in design and architecture programs before landing a job in yet another media program with intellectually reluctant if not deeply cynical students. Why bother after all this? Because there is an incredible potential for collective experiences of self-organized modes of research development. Moreover, the profound connection between media and sociality is endlessly rich and holds the capacity to transform societies in substantial ways.

Media studies, *was nun*? What do we do, teach students to write an iWhatever app? Is that all there is? Will it become an optional choice to include technical education in a media studies degree? Linux for freshmen? No. We need to discover (critical)

concepts, which could be classified as mere luck but is a skill that can be trained nonetheless. One needs to develop an eye for them. In the fluid media environment concepts often hover on the surface but can only be recognized after intense intellectual expeditions into history, for example, mid-eighteenth-century Continental philosophy. Ideas then spring back to life in untimely contexts, where they become productive. Being informed about the latest hypes alone will not do the job. Only by making strange what appears common can one come up with concepts that capture new, surprising meanings and phenomena.

Organizing Concept Production

So what will happen if media studies finally moves from analyses of visual representations into a methods-based realm of post-visual culture? The challenge lays beyond, in the tactile, local, relational, haptic, invisible, and conceptual levels. The work we collectively do as practitioners of media research resides in nonrepresentational dimensions: mobility, miniaturization, and media integration into the urban realm. And there we find a place for political-economic research coupled with a practice that is focused, at least in our minds, on the production of open standards and open storage. So are we urban studies, design culture, IT? The sheer scale and proliferation of network media comprise complex environments, but it is not as though environments were any less complex than before. It's just that disciplines have trouble dealing adequately with informational, ontological complexity – to do so will require a transdisciplinary move. This is where the postmodern project comes to an end – the world refused to be deconstructed and took revenge.

Humanities academics have become more conservative and have regressed into intellectual restoration, with less concrete experience of how to organize things. Empirical simplicity has become the preferred mode of research in place of a reflexive and political understanding of processes and relations. Reflexive mediation these days is not limited to media *per se* but addresses the proliferation of borders, of affects, the multiplication of labor and subjectivity. The institutional and social landscape of work has become one defined by short-termism: portfolio careers and project-driven jobs. There is no consistency other than the unstoppable waves of inconsistency.

Media theory needs to unpack the subconscious terminologies that float around, such as friends, open, free, social, and local. As an example let's start with a critique of openness as a hegemonic rhetoric. There is a universal position across leftist culture that is anti-intellectual property. Anti-IP advocates are the noisiest in Old Europe, where one can still afford to be a cultural producer on the payroll of the state. But the media economy is moving beyond the IP system. The information economy today is based on the control of user profiles for recombination then repackaging for third-party clients desperate for affirmation of real consumption. Of

course, the data miners such as Google and Facebook trade in fiction as much as the previous media economy, where advertising space and time were sold then broadcast to the masses.

In praise of conceptual thinking, we want to make a claim that collaborative methods immanent to media of communication – in short, the work of organization – can withstand time in an environment that sees platforms, software, and code languages coming and going at increasing speed. In 10 years' time people will barely remember what an iPhone was, let alone have the necessary knowledge to write an app for it. Media studies should become more sustainable – it needs a projection into the future where the shelf-life of the concept is not as short as your next software update.

When programmers write a line of code they execute it within the sandbox to see if it works. Where is such a testing environment for media studies to be found? Science has its laboratories, but where are ours? This situation can be seen in the precorporate and dull and formalistic way in which computer labs the world over are all the same: hostile settings of absolute sterility with security officers and cleaners as the only human element. What we need is more uncertainty, chaos, and untimeliness. Rise up outside the campus, open the doors and windows (equipment prices are no longer a large barrier to communication). Instead, we see students rolling in like sheep, turning on outdated locked-up hardware according to the rules and regulations stipulated by the IT police, and then going home. And these are supposed to be people educated for creative futures. It also has to be admitted that there is a profound reluctance on the part of the vast majority of media studies students to display the tiniest slither of intellectual curiosity. Let's break through these role models.

Concept production is intimately connected to the challenge of method, of how we operate in specific situations (whether online or offline). In the global economy, for instance, the researcher can have a new role entirely in the collective analysis of workplace settings that are dependent on the use of digital media and software applications in daily business. Think of the global logistics industries and their management of labor and supply chains. There is enormous scope for the birth of a new field of software studies to analyze the effects of logistics software in the production of organizational systems and subjectivity.

Instead of promoting the informality of the existing social networking sites, we propose to experiment. If we champion "orgnets" here it is not as an identity or brand. Similar names are plentiful and there should be more, starting with barcamps, temp media labs, unconferencing, summer schools, book sprints, and master classes. We need to theorize these unruly practices in education. Just think if Christopher Kelty's (2008) "recursive politics" concept could be inserted into the aesthetics agenda of software studies. Or if we could have a "sonic studies" with radio as a technical media of writing, and DJ Spooky as prime theorist.⁹ In order to get initiatives up and running we have to glance away for a moment from the busy screen: Oubliez la Pop, Lady Gaga, or South Park as organized networks? Forget it. There is no match or

correspondence. Critique is not a mood or sentiment but a plan to organize things in a different manner.

ACKNOWLEDGMENTS

A first draft of this essay was written in Shanghai, July 2010. Thanks a lot to Kelly Gates and Morgan Currie for their valuable suggestions and copy-editing work.

NOTES

- 1 We have discussed the concept of organized networks across a number of essays, including Lovink and Rossiter (2005) and, more recently, Lovink and Rossiter (2011).
- 2 For a discussion of the Frankfurt School as a precursor to organized networks, see Rossiter (2006, pp. 19–22). More on the orgnets concept can be found in Lovink (2007).
- 3 As examples of non-academic research collectives, one could mention groups like Critical Art Ensemble, Institute for Applied Autonomy, Bureau d'études, Beaver Group, the European Institute for Progressive Cultural Policies, among many more. Our question is why the academy seems incapable of generating such inspiring and productive formats and practices of research.
- 4 See the Australian Research Council's webpage on "Linkage Projects" at http://www.arc.gov.au/ncgp/lp/lp_default.htm

Betting on YouTube Futures (for New Media Writing and Publishing)

Alexandra Juhasz

ABSTRACT

The work of media scholar, artist, and activist Alexandra Juhasz directly addresses many of the concerns that Lovink and Rossiter raise in the previous two chapters. In this chapter, Juhasz repurposes blog posts about her undergraduate media studies course and “video-book” *Learning from YouTube* to consider the future of new media scholarship: how academics might write and publish about and in new media. By moving her writing from screen to page, the chapter itself enacts the concerns of circulation, vernacular, standards, and publication at the heart of new media studies projects and the work of writing about them. Juhasz demonstrates and discusses how academic styles, methods, and audiences can adapt in ways that are productive and dynamic. The changing roles that control, knowledge, and reflexivity play for YouTube, Juhasz’s course, and digital culture more generally are central frames for the chapter, as Juhasz thinks through what her own experience teaching with and writing about YouTube suggests for the future of digital humanities.

Introduction

This “essay” links seven blog posts from 2007 to 2010 by using brief asides and introductions. The topic is my undergraduate media studies course, titled Learning from YouTube (held

The International Encyclopedia of Media Studies, First Edition.

on and about the site in 2007, 2008, and 2010), and its related bodies of writing. I also consider new media's future scholarship: how academics might write and publish about and in new media. I choose to repurpose these short, time-stamped ruminations because they reflect my feelings, process, analysis, and output – as written for the intelligent and curious but not necessarily academic audience of my Media Praxis blog (www.aljean.wordpress.com) – while also mapping the arc of a project in new media teaching, production, and writing from inception to publication. Presenting these relatively unmodified excerpts of online, amateur writing within the fully vetted scholarly space of this edited anthology – where audience, form, and use are more standardized and professionalized than is true of the place the writing considers or where it was first presented – is itself a bit of a self-reflexive shell game. By moving writing from screen to page, I enact the concerns of circulation, vernacular, standards, and publication that will prove to be at the heart of this and many other new media studies projects and the writing about them.

The essay is situated within the (very brief) past, present, and future of YouTube studies and (on- and offline) digital humanities scholarship and publishing. My writings about the course – first in these selected blogs (and a great many unselected others residing online) and YouTube videos,¹ then in their translation into scholarly essays (online and on-paper), talks, my 2011 online video-book,² and then shifted to paper here – were created in (digital) dialogue with new media scholars rethinking new media writing (Liz Losh, Michael Strangelove, Chuck Tyron, Michael Wesch). I met and learned from these scholars online, through their blogs, as well as in the real world of new media studies. For example, I have learned from my local colleagues, Kathleen Fitzpatrick (who is completing a book on the obsolescence of the academic book, written first online and then, once peer- and copy-edited there, to be published to paper by New York University Press), and the team at University of Southern California's Institute for Multimedia Literacy and their online journal, *Vectors* (who helped me conceive and architect the video-book). My community raises the following writing and publishing gauntlet, to which I have responded:

We need to think less about completed products and more about texts-in-process; we need to think less about individual authorship and more about collaboration; we need to think less about originality and more about remix; we need to think less about ownership and more about sharing. None of this is to say that the former structures will disappear, but rather that they'll be complicated by the modes of communication that network technologies privilege. (Fitzpatrick, 2011)

New media scholars have benefited from the communication that “network technologies privilege,” not only in their writing, but also by creating online communities, conversations, and opportunities. In my YouTube project, I attempted to build my students into this dialogue. When I commenced the course in 2007, there was almost no scholarly writing about YouTube. Discussion about the site tended to be found within journalism and the blogosphere or on the YouTube site itself. This was one of the reasons I required my students to do all of their research entirely within YouTube: what does (the future of) media studies look like when the topic of inquiry is also its library or when the authors of analysis are its everyday users or

owners? Given the paucity of “serious” scholarship at that time, my undergraduates engaged in the rare and exciting activity of original and groundbreaking research. (YouTube scholar Michael Wesch was also engaging in a similar project with his undergraduate anthropology students who were producing YouTube ethnographies.)

By the time I taught the course for the third time, in the fall of 2010, there were five scholarly books published on the subject (including my own *Learning from YouTube*, which I taught in beta) that became the course’s new, more traditional backbone.³ All authors writing about YouTube were quick to note its chameleon-like nature:

Because there is not yet a shared understanding of YouTube’s common culture, each scholarly approach to understanding how YouTube works must make choices among these interpretations, in effect recreating it as a different object each time – at this early stage of research, each study of YouTube gives us a different understanding of what YouTube actually is. (Burgess & Green, 2009, pp. 6–7)

In the 2010 class, we enjoyed Burgess and Green’s political-economic and communications-based analysis of YouTube as a platform holding established media in dialogue with participatory culture, Strangelove’s (2010) participant ethnography and more cultural studies-like approach to the “extraordinary videos of ordinary people,” and the eclectic and provocative anthologies of Vonderau and Snickars (2009) and the Institute of Network Cultures that look to YouTube’s structuring metaphors – platform, archive, laboratory, medium – to define its meanings, value, and research methods.

This range of approaches to YouTube studies, and the many YouTube’s it produces, proved an excellent preliminary education in meta-field and meta-method awareness for my students, who learned that how they study affects what the field might be and what they might know. However, the quick consolidation of authoritative or expert analysis on the subject (including my own) greatly altered the 2010 students’ sense of their own role in the creation of knowledge, thereby shifting away from how the first offering of the course was able to mirror the structure of YouTube (which pretends user control and celebrates amateur knowledge). The (changing) roles that control, knowledge, and reflexivity play for YouTube, the course, digital culture, and this and other writing about it remains the central (if ever-deconstructing) frame of this project, including how to write and publish about it. What this might mean for the future of digital humanities will be the subject of this essay.

Introduction to Blogs 1 and 2 on Teaching the Class

I decided to teach a course about, and also on, YouTube, hoping to make visible the site’s architecture, ownership, and grossly limited functionality (as well as, through counterdistinction, how those functions define the space of a more typical brick-and-mortar college classroom). Given these operating assumptions, I knew in advance that I could not write a scholarly analysis of this endeavor relying solely on YouTube’s platform and its paltry functions and

undifferentiated audiences. Thus, I blogged about the course as it was happening, and after it was over, and used these reflections both to enrich the course and as exercises toward more traditional scholarly output. My blog voice tends to be informal, short, and experience-based rather than research-based. I publish it here, virtually unedited, for reasons similar to how I structured the course: conventions of form, audience, intent, and method are NOT the same between written and online expression, even as they increasingly converge. Put the wrong object in a built-to-form box and suddenly the shape of the container becomes visible.

Note: I have created a typographic signpost for this paper version of my blog writing to mark the blog's many (missing) links and videos: <for an absent link>, [*for an impossible-to-embed video*]. This typographic mess indicates some of what is lost as we begin to move, willy-nilly, from screen to page, amateur to expert, private to public, popular to arcane. Such failures are productive, allowing us to see the shape of what is missing.

BLOG 1: Learning from YouTube, 09-07-2007⁴

I am teaching an experimental class <class page⁵> on/about YouTube this semester. [**“Learning From YouTube, Sept 4 2007 Pt. 1,” mperry08⁶**]

After two class sessions I realize this course is going to be really fun and super hard, challenging me as a professor in ways that I am unaccustomed to. Let's start with the press, the numbers, and the public nature of the course (all related). After the first course, I was interviewed for an article about the course for <“YouTube Studies”⁷> *Inside Higher Ed*. The article came out before the second class, and suddenly there were two journalists and a photographer in attendance. This media attention, added to the fact that we tape and put on to YouTube each class session, and that I had learned that people actually *were* watching these classes, led me to be self-conscious to a degree I am usually not when I teach. Typically, over an hour of teaching you hit some high notes, make a few blunders, and otherwise get through. You're human, and undergraduates are your sole witness. During our second class, the issues got serious and complex quickly, primarily concerning the ubiquitous representations of race and racism on YouTube and in our class (and this is good) but I was self-conscious about how my colleagues would view the way I didn't hit gold in the live processing of these complex ideas. Now the class is about, among other things, issues of privacy as well as access in higher education. And while I'm committed to what it means to open access to my class, it now seems clear to me that it limits my teaching (and perhaps my students' learning, in that they are equally self-conscious).

Numbers (hits to the page keep doubling) also add a weird and unwieldy stress to my teaching, and the course. Yes, they are informative about the logic of YouTube, but ultimately invasive. As is simply managing the outside communication this brings (emails, letters, requests) that expand the demands on me from those of my thirty enrolled students to anyone who is interested and has access to a computer. It was

exciting to see that in the second class, and with only the most superficial of assignments, the students were already touching on many of the BIG IDEAS about YouTube and digital culture: its postmodern reliance on humor, celebrity, and self-referentiality to mainstream culture; its democratic function as soap box for the talent/opinions/expression of regular people; its mind-numbing, time-wasting superficiality; the raucous and unruly nature of the conversation it produces. My challenge will be to work with the class to hone, focus, and systematize such conversations given that we cannot refer to other scholarly works (one of my imposed limits is that we cannot leave YouTube), and given that I have ceded a certain amount of real control to them by teaching the class as a communal, user-generated endeavor. How will I guide the conversation in ways scholarly and rigorous given that our frame and guide is not?

Frankly, I'm not certain that we're doing it, that there's enough to do or know about YouTube (given YouTube as the tight structure for gaining such knowledge) to sustain a course. While I've succeeded in developing a structure that models the content I seek, I am not certain we need fifteen weeks to figure this out.

BLOG 2: Learning from Learning from YouTube mid-way, 10-29-07⁸

Mid-way through the semester, and I'm pleased to report how much we've actually learned, albeit experientially, through doing (and not doing) while stuck in all that is powerful and inane on YouTube. Every failure has been a learning experience, although organized by frustration and lived within contained chaos. Of course, I set out to run this class so that such failures would help make clear the costs (and benefits) of our rapid, giddy acceptance of new digital environments without a concurrent set of criticisms and demands about best practices for making use of this, the most democratic distributor, platform, and archive of moving images.

[**"Summary of Learning from YouTube at the midterm 2," mediapraxisme⁹**]

And now, just six weeks in, my students' criticisms are being well made: about public scrutiny and the ridicule of the mainstream media (leading to analysis of the role of fame and celebrity in YouTube culture); the disruptive additions of hundreds of non-class videos and comments on our class's group-page (leading to analysis about the making-public of the once-private on YouTube); our inability to interact in real-time and in a central space when we are on YouTube (the groups' pages are even harder to navigate and make use of than are the user pages); the site's weaknesses around finding and linking material (leading to analysis about what is intentionally not-well-made on a site that functions best for the relay of entertainment); and a more keen awareness of how censorship and corporations are well-served on the site while community and art are not. We've also deduced that there are two Youtubes: the mainstream one made and maintained by Google and millions of users out to waste some time, and the innumerable experiments in form, content,

behavior, and community that fall outside the logic of entertainment, advertisements, popular culture, hits, numbers, and favorites (what I call NicheTube). See one YouTube and the other becomes obscured; ask a question of the other and learn little of use to better understand the first. Our class falls into NicheTube: unseen by most, unattended to by the site's architecture, poorly supported, thus barely getting by but learning nevertheless.

All this has contributed to the class's clarity about YouTube's ineffectual structure for higher learning even as it does other things well. In an attempt to mirror the architecture of YouTube, this "student-led" course, open to user-created flexibility and innovation, is still organized by my friendly but controlling vision and parameters. And from this controlled chaos, the strengths and limitations of contemporary learning occurring digitally, publicly, visually, and in corporate-owned environments are being lived and then theorized through this doing. The students have posted their first research projects as well as mid-terms about what they've learned: they are systematically naming the structures, methods, limits and strengths of YouTube just as they are beginning to master its language, which is to say, we're beginning to see a variety of strategies towards the illustrated lecture. Pressing the students to express critical content through short videos that use YouTube's vernacular has proven to be one of the real successes of the experiment, as it is clear that over the next few years they will inhabit a culture where rich and necessary communication will occur visually, not just through the written word. They're taking preliminary steps towards complex uses of this communication device. Although the students had a variety of production skills going into the class (as is true for YouTubers as a whole), half way through the class they have hacked the YouTube video to express complicated analyses of YouTube itself.

And from their work I have learned, too. About teaching, primarily. I have found that seven oppositional binaries are being disturbed during this pedagogic experiment, leading to unsettling and mostly unproductive alterations in the ways we have typically taught and learned in higher education by keeping distinctions pure: public/private; amateur/expert; democratic/corporate; structured/anarchic; community/individual; entertainment/occupation; flow/depth. I hope to discuss the difficulties for teaching inspired by these flattened binaries in later posts.

But for now, I need to attend to the more urgent fact that I am uncertain where we are going to go and what we are going to do. This is a scary time for me, as the professor, in and out of control, with students who want and yet disdain discipline (in pursuit, they say, of "fun," yet still ever fearful of grades), and with failure as our guide: to interact, build ideas, feel safe, be heard or respected, or locate compelling analyses. The second half of the class is intentionally and completely unscripted. I expect we will choose to go off YouTube, to do some traditional research and learning, bring in specialists, read some postmodern and new media theory, turn it into a more regular class where "real" or, let's say, more traditional learning can occur. But some of the students have begged us to stick out the experiment, to consider and propose better practices for what learning in and through corporate-controlled entertainment might look like.

Conclusions for Blogs 1 and 2

The seven collapsing binary oppositions that I identified in the fall of 2007 – while undergoing a number of permutations over the years and eventually becoming the ten “YouTours” that shape my video-book – have proven to be one conceptual structure that I rely upon to discipline and format my thinking and writing in the face of YouTube’s structuring chaos. You will see them reemerge across this essay (in blog 4, on YouTube Writing, for instance, where they take on a slightly different nomenclature but serve a similar disciplining function), and I use them as easily here.

For instance, the Learning from YouTube course, and its later written forms, trouble a public/private binary that usually serves to stabilize our work, authority, and purpose as teachers and scholars. The operating, structuring anxieties of any particular person, or professor, are typically hidden from the view of colleagues and students to allow for a performance of authority and constancy that seems necessary for a streamlined or efficient production of knowledge. By the middle of the semester, it was already crystal clear that my students did not like the loss of control produced by my giving them control. Their discomfort proved a productive obstacle to their education. By naming their desire for discipline, we suddenly saw with some clarity the shape of more traditional, comfortable, and yielding forms of teaching/learning. Even so, was there enough to learn from YouTube to fill a semester? Yes and no. Yes, when YouTube became a metaphor for other systems that control the flow of ideas, community, and authority. No, when we deduced how paltry YouTube’s resources were for detailed, rigorous, auto-research. Yes, when we realized that this, itself, taught us about the limits and strengths of online learning.

Introduction to Blogs 3 and 4 on Organizing Course Output and Conclusions

After the course ended in Fall 2007, I used my Spring 2008 sabbatical to categorize, theorize, and publish work about the enormous amount of video output and ideas created on and about YouTube over the previous semester. Then in Fall 2008, I taught the course again, albeit differently (with both more structure and traditional reading assignments), and went on the road giving talks that attempted to stay situated within the vernaculars, forms, architecture, and machines of the networked digital. Interestingly, I found myself most moved to talk and think about meta-issues of pedagogy, field, writing, and publishing over sharing my “findings” about YouTube. Perhaps this is because that work had already been done – with great panache and some totality – by my students within their hundreds of course videos, and then also because YouTube itself, alone, was not quite giving or changing enough to secure my ongoing attention and output of scholarly work. (Of course, many others have gone on to ask of it innumerable questions from a variety of fields with productive results.)

The blog posts that I have selected from this period reflect two areas of early thinking: (1) my “tour” project – where I tried to organize and systematize the huge output of videos made for the class, given that they swam, uncontrolled and unusable, on YouTube, and (2) my initial thinking about “YouTube writing” – where I tried to create a terminology to catalogue the writing practices exhibited in my students’ work. These two posts also demonstrate some of the practices and preoccupations that haunt this body of work: (1) “little lists” (seven binaries, nine tours, five differences between scholarly and YouTube writing, eight writing styles) and (2) feminist, self-reflexive interrogations of the forms I use and the values I hold.

BLOG 3: YouTube Tour #1: Education, 02-06-08¹⁰

Today, I posted my first “tour” of the work and lessons learned by the Learning from YouTube class. I will try to post one per week, with accompanying blogs, for the next eight weeks, resulting in nine tours on: education, entertainment, popularity, the vernacular, the visual, users, owners, community and the archive. It took me a while to decide how I’d like to present the many things I think we learned during that hectic semester, and I was pleased when I remembered the “tour” method: one we had devised during the semester to try to work YouTube against itself by creating a linked, sharable, and repeatable path, with associated comments, through its chaos. It seemed right to “publish” my results on YouTube, continuing to hack and use its forms to hold our analytical content and designs; to continue to use it to speak to and about itself. Attempting to present my analysis of the site on its pages, rather than, say, in those of an academic venue, demanded profound changes in the nature of my work, as a media scholar and educator, that, as ever, prove telling about the workings of YouTube.

The key differences were a matter of: time and brevity, vernacular, audience, professional standards, and language. In brief, time is of the essence on YouTube. As I made the video for this tour, and then the tour itself, I was hyper-aware to keep cutting, condensing, summarizing, and simplifying to speak effectively on YouTube (to keep the attention of its distractible, easily bored, viewers), which, of course, is also a major part of its vernacular: there is a premium put on ease and efficiency, condensation and simplification. Whereas my students are forced to hear me speak, or at least pretend to, the YouTube viewer must *want* to stay there because of my media skills and compellingly expressed information, because I entertain her. A language of bullets: quick, exciting, and mobile. And here I would add the necessity for using non-specialist language so as to be heard effectively, which gets me to audience, for I assume a general and diverse audience on YouTube, one I do not imagine on this blog, and one that has no relation to who reads me in academic journals. I can count on no shared references or lingo, other than that of popular culture, which diminishes the complexity of my thoughts even as it expands their reach. Unlike a classroom, where one speaks to undergraduates equally unschooled in scholarly

discourse but where you can school them and together grow a shared language, the scattered, random nature of YouTube's viewership demands that one always stays at the most rudimentary level, never giving the audience an opportunity to grow its vocabulary.

On a different note, the systems of proof and authority are diametrically different on YouTube from those of academia. My "proof" on YouTube is always another video, any video. Its existence, and mine, on YouTube's pages grants us as much and no more authority than any other user, that is, of course, unless we have the power of numbers – glorious hits – on our side. Academic writing, on the other hand, also relies upon the affirmation of outside voices; however, what differentiates these voices is that they are accredited (through institutionally sanctioned systems of vetting via publishing and other forms, like tenure) and their arguments build relationally, slowly, and in dialogue with a tradition. This is diametrically opposed to the piecemeal character of both the rant and private confession definitive of discourse on YouTube.

Clearly, these reflections make me sound a snob, and not the proponent I have always been of a democratization of access to and discourses about the media. However, I have learned that expanded access cannot itself be a stand-alone goal. Access to media production, and dissemination, needs to be accompanied with the gaining of other tools that allow for the growing complexity of discourse: and these are, quite simply, the capacities to work together and to learn from what has been done before. I speak about these ideas in greater length, and through scholarly discourse, as a "real academic talk" forced on to YouTube here:

["Queer Realism on YouTube, Juhasz conference talk, 1/2," *mediapraxisme*¹¹]

BLOG 4: On Video Writing, 11-04-08¹²

["Intro to Video Writing Conference Talk," *mediapraxisme*¹³]

These words are actually the transcript of a "talk" I will present at the Future of Writing Conference at UC Irvine. It begins with the video above (you need to watch it, just one minute, to begin), and links to many more YouTube videos across its duration. You can also watch the talk through my Playlist <"Video Writing: Talk for UCI Conference, 11/08"¹⁴> on YouTube.

My ["Video Writing Talk, Part 2," by *mediapraxisme*¹⁵] gimmick was to teach the course both about and also on YouTube. This allowed for a brief ["Learning from YouTube on TV," by *mediapraxisme*¹⁶] viral moment last Fall, itself a great ["YouTube Comments," by *dallen11*¹⁷] lesson in the workings of popularity, simplicity, and humor within online social networking and its media convergences.

Needless to say our aims for the course have always been ["Video Writing Talk, Part 3," by *mediapraxisme*¹⁸] serious. In Learning from YouTube, I am interested in participating with my students in ["What Can YouTube Teach Us?" by

baxterici^{19]} primary research about the forms and functions of this poster-child for Web 2.0. By together engaging the site against YouTube's primary aims of entertainment, we learn about the limits of its corporate architecture and our own needs as new media makers and learners.

For the class, students are required to do all their coursework as either YouTube videos or comments. In the process, they are remaking academic writing for the digital classroom. In my [**"Video Writing Talk, Part 4," by mediapraxisme**^{20]} talk today, I will introduce eight new forms of academic video writing: Public Writing, Isolated Writing, Reflexive Writing, Visual, Amateur and Control Writing, and Convergence and Censored Writing. While each of these stylistics are also used within traditional written expression, they are significantly modified, hybridized, and amplified in online academic video writing in ways that serve to demonstrate the current state of writing (and teaching) within Web 2.0.

I will begin by naming some common forms and approaches that appear across the eight academic video writing forms that will be the focus of this talk. I have found there are three common structures for video writing: the first is **word-reliant** (reading or writing a traditional paper on to video. Notably, this form allows for the most complex meanings and the least interesting videos). Next, probably most common, and arguably most successful for our purposes, is the **illustrated summary**, composed through the bullet pointing of more detailed ideas that are cut to images of YouTube as evidence. Finally, perhaps my favorite, and certainly the most creative, is the YouTube **hack**, where academic content is wedged into a popular YouTube vernacular form. Besides these common formats I hope you will observe the ubiquitous use of two, often understood as "postmodern" devices of tone and structure – humor (most often being cynical, sarcastic, or parodic in form) and self-reflexivity. Finally, sometimes my students will pull the power play of **sincerity**, which, in ways YouTube, creates productive tension with the site's expected cynicism and humor. As you may have already deduced from my academic video writing here, detailed rhetorical analysis, the bellwether of productive scholarly expression, is not the most powerful of tactics for this venue. Thus, I would characterize my own production as word-reliant, amateurish, public, reflexive, and also an example of control and convergence video writing. I hope that by talk's end, my own terms, tactics, and practices will be clarified.

1 [**"The Future of Writing," by wtto2005**^{21]} Public Writing: The classroom ideally depends upon an intimate and "safe" gathering of carefully selected students to create a communal pedagogy. They write for the professor, and sometimes for each other, but the general public is neither their audience nor critic. Privacy and mutuality encourage the development of voice. In a YouTube classroom, where anyone and everyone can see and participate, such tried and true pedagogic structures shift. While access grows, the disciplining structures in place in a closed classroom or private paper cannot be relied upon.

2 [**"PlayRadioPlay-Decipher Reflections from Reality," by Raspefly**^{22]} Isolated Writing: YouTube writing, academic or not, while publicly presented, is often

produced in and about isolation and in the hopes of finding community. This form of writing mirrors YouTube's *raison d'être* – wasting time – and often results in meaningless, silly, or narcissistic ruminations on self. However, its reverse is the humble stab at sincere communication, banking upon “NicheTube’s” guarantee that no one will actually find, see, or hear you in the uncharted and unruly sea of similarly unheard attempts at communication and self-expression.

3 Reflexive Writing makes YouTube its content and form, creating a dizzying hall of media mirrors where “the Real” dissolves, a necessary but unmissed casualty to a more rich, and endlessly self-referential and self-fulfilling life online. [**“Britney Spears Uncensored Dancing and Eating,”** by jweitzel²³]

4 Written expression is closed down on YouTube. Its 500-character limit, and sandlot culture, produces a dumbing-down for the word nearly impossible to remedy. So, [**“Everything People Love About YouTube,”** by edauehauer²⁴] visual writing reigns. In this highly entertaining form, meaning is lost to feeling that is buttressed by the sound of music and cut to the speed of final cut pro. Both spectacle and humor reliant, this is also the terrain of the expert (dependent upon corporate or popular media even if modified by “amateurs”). It is hard to use for academic video writing, but students try, usually through opposition.

5 [**“MS 130 Want some high school Musical 3? Watch till the end!”** by ziliemd²⁵] Amateur Writing is word reliant. It is either the stuff of real people talking into their low-end cameras about their private pleasure or pain, or regular people demonstrating their exceptional or laughable skills. It can be popular if it seems sincere, or if a spectacle of humiliation or extreme talent is at its core.

6 [**“Summary of Learning from YouTube at the Midterm 2,”** by mediapraxis²⁶] Control Writing works against the chaotic, undisciplined culture of YouTube and attempts to force structure, and the possibility for building complexity, onto its pages. The significance of discipline for academic work proves the rule. Without it, ideas stay vague and dispersed, there is no system for evaluation, and you can't find things or build upon them. On YouTube it comes across as somewhat School Marmish, yes?

7 [**“Blacks on YouTube Final,”** by VannaBlack4you²⁷] Censored Writing is definitive of YouTube (heralded as a “democratic” platform) where users routinely flag content, servicing the corporation, whenever it strays from the comfortable confines of the hegemonic. To see to this video, “Blacks on YouTube Final,” you need to be of right age, as it has been flagged for inappropriate (critical?) content. Please note: The video that secured the most hits in our video writing contest, “Nailin’ Palin” (the ripped first minute of a Hustler hit), an example of Copyright Writing, cannot be included in this tour because it was taken down.

8 [**“YouTube in Context,”** by kimballzen²⁸] Convergence Writing: As Henry Jenkins points out, new media allows for writing that gains its impact by moving across platforms and building upon the power of ready-made media already encrusted with meaning (and ownership). So easy, even [**“Small Paul (Frank) Soulja Boy Dance,”** by mediapraxis²⁹] (my) children can join the fun.

Introduction to Blogs 5–7: On Publishing in the Digital Humanities

In the Summer of 2009, I took my nearly 200 examples of YouTube writing (these and other blogs, published essays online and on paper, videos, interviews) to the Vectors National Endowment for the Humanities Summer Seminar with the hopes of turning them into a proper, big, formidable publication: a “book.” These next selected blog posts mark the process of conceptualizing this work within both my career’s arc and the emerging field of digital humanities, making some sense of the demands of this new, new media writing, and then negotiating the actual contract for this strange form. In all three blog posts I evidence a push against professional constraints – of academic fields, writing forms, and publishing – themselves bound to practices and norms of vetting, promotion, and disciplines. Here we see how the unruly nature of the subjects of new media studies creates the necessary dismantling of another oppositional binary: control/chaos. My work on and about YouTube at once necessitates attempts to systematize and contain (evidenced in Blogs 1–4) and to challenge and expand limits (Blogs 5–7). Given the staid structures of our profession, and the unruly inventions of this and similar efforts, another contradictory frame then comes into sight: it is, counterproductively, that full professors, rather than young scholars, are the most readily enabled (through the institution’s slowly accrued freedoms and powers) to test boundaries.

BLOG 5: Digital Humanities, 7-17-09³⁰

I am spending a month at USC’s NEH Vector’s³¹ Institute, <“Broadening the Digital Humanities.”> Eleven scholars are given the opportunity to develop digital projects through the generous technical and intellectual support of the <Institute for Multi-Media Literacy.>³² At the first session, Tara McPherson³³ asked of us our relation to the term “digital humanities,” and I said that I had always thought of myself as a “media scholar, artist, and activist” but would be pleased to also take on this newer title. However, after spending a few days amongst digital humanists of various home disciplinary stripes, I believe that this interdisciplinary field holds much in common with earlier practices of more radical scholars who have pressed at the intersections of academia and art and/or activism.

In an unpublished draft essay by Institute fellow <Katherine Hayles>,³⁴ “How We Think: The Transforming Power of Digital Technologies,” Hayles engages in dialogue with eighteen Digital Humanists to better understand the current shape of the field, in her opinion, in its 2nd phase (having gone from text to multimodality). She proposes how Digital Humanities move traditional Humanities from “text-based study . . . to time-based art forms such as film, music, and animation, visual traditions such as graphics and design, spatial practices such as architecture and geography, and curatorial practices associated with museums, galleries, and the like.”

I would want to say the same thing, just differently. Listening to my ten <Kairos>³⁵ colleagues <Hemispheric Institute>³⁶ describe <Digital Durham>³⁷ their <Virtual Politik>³⁸ exciting <version.org>³⁹ digital projects, I see a turn in traditional scholarship toward accounting for and embracing the demands of **art** and **activism**. Namely, digital humanists need to **collaborate** (a well-developed set of practices refined by those in film or theater, for instance, and theorized by feminists and other activist-scholars who work within communities while being committed to rethinking power relations). Similarly, digital humanists engage **affect** and **aesthetics**, must make sense of their relation to **machines**, take account of **audiences**, as they no longer necessarily speak only to a small and rarified readership of their peers, and must think seriously about **time** and **space**, which to my mind, demands an **ethics** about how one's "intellectual" practices affect the lived world and its inhabitants. Thus, I'd suggest that the "digital" part, only the newest technology of the day, is perhaps what was needed to push more scholars to engage with the personal and political implications⁴⁰ of their work. [**"A Gram O Pussy by Duran Ruiz and Scarlot Harlot," by mediapraxisme**⁴¹] See also Sharon Daniel's Vector's project <Public Secrets> on women and prison.⁴²

BLOG 6: On Publishing My YouTube "Book" Online, 09-24-09⁴³

Tomorrow I will be visiting Tara McPherson's graduate course on something like "theories and practices of new media," and she has asked me to present, quickly, some of the difficult considerations that define my current efforts (with the assistance of the <Vector's>⁴⁴ team) to "publish" my various YouTube findings, practices, musings, papers, videos, blogs, tours, and internet publications into a digital "book." [Author's note (May 24, 2010): since this was written, the on-line "video-book" has been accepted for publication with MIT Press as part of a Mellon grant on rethinking humanities publishing via the digital, and will be hosted on their website, for free, I think, once all these difficult decisions are finalized.]

By way of introduction, and as a method to display the many contradictions and conundrums in the very format that is the problem, I will briefly list on the blog ten themes that define my (attempts to) move my "book" entirely online:

- 1 Audience. When you go online your readers (can) include non-academics.
- 2 Commitment. Harder to command amidst all the distractions.
- 3 Design. Matters more; means.
- 4 Finitude. The page(s) need never close.
- 5 Interactivity. Should your readers, who may or may not be experts, author too?
- 6 Linearity. Goes out the window, unless you force it.

- 7 Multi-modal. Much can be expressed outside the confines of the word.
- 8 Network. How things link is within or outside the author's control.
- 9 Single author. Why hold out the rest of the Internet?
- 10 Temporality. People read faster online. Watching video can be slow. A book is long.

Here's the shape of my current project, in development: my video-book will speak to an audience of scholars, committed intellectuals, and media activists through a simple, legible, but perky interface that refers, visually, to that which it critiques, while on a deep-level (via programming) performing that which it says YouTube precludes. It will stay open, as I continue to learn, but there will be only limited avenues for interaction. I will produce several arguments that the reader can choose to follow or depart from at their whim and a second structure that gives the user more opportunities to l(th)ink for themselves. A good deal of the ideas of this text will be expressed through video which will sit in a highly designed and interactive relation to written words with which it is associated. I will try to "time" these arguments, a kind of montage really, to command my readers' interest and commitment.

BLOG 7: Contractual Mayhem: On the Absurdities of Moving from Paper to Digital in Academic Publishing, 06-11-10⁴⁵

I am currently negotiating my contract with MIT Press⁴⁶ to "publish" my "video-book" about YouTube in Fall 2010. The enlightening, confusing, crazy, friendly, and productive conversations I am having with my editor, Doug Sery, and my production team at USC's <Vectors>⁴⁷ and <Institute for Media Literacy>⁴⁸ are a telling indication of how far academic publishing (and writing) has to go to match the technological possibilities for writing, research, and public intellectualism afforded by new media. My project will be the first publication supported (in part) by a Mellon Initiative, "The Alliance for Networking Visual Culture," which set out to rethink academic publishing (in conversation with <UC>,⁴⁹ <MIT>, and <Duke>⁵⁰ University Presses) in light of media archives (including the USC <Shoah Foundation>,⁵¹ <The Hemispheric Institute of Performance and Politics>,⁵² <Critical Commons>,⁵³ and the <Internet Archive>⁵⁴) and Digital Humanities. With Doug's kind permission, I will be presenting some of our conversation on my blog as a way to network these sorts of negotiations, and the questions they raise for digital humanists, new media scholars, and academic presses.

Doug:

Thanks for making a first pass on the contract. I am thrilled to be working with MIT, and realize "The Work" (what I am currently calling a "video-book" until a better name is found) is the first of its kind, and we're making this happen as we go. Towards this end, here are the notes I promised about the concepts in the first draft of the contract

that don't align well with my understanding of this born-digital publication. I think the conceptual issues for us to tackle are:

- 1) **Delivery** of the Work: what form is acceptable given that the Work lives only online (in a data-base) and not in "word-processing files," as you request.
- 2) Author's **Warranty**
 - a) I am wondering about URLs and YouTube videos that constitute a large portion of the Work. Of course, the writing is all mine.
 - b) Also, regarding **credit**: It is not clear to me, contractually, how to credit the design team who built the Work which holds my words and points to others' videos.
 - c) As for **Previous Publication**: a significant amount of the Work has been "published" already on my blog, although reformatted and designed for the Work.
- 3) **Size** of the Work: Do you actually want a **word count** for the Work? This will not account for the videos, which take up a significant portion of its content. Should there be a video count, or a time count, too?
 ["KNX Radio interview re YouTube at 5 years," by mediapraxisme⁵⁵]
- 4) **Royalties**: There is currently language about royalties that gives me 0% of all books sales, which makes no sense, as there is no book. The language in the separate portions called Electronic Rights and Royalties from Other Sources (i.e. "if the Work is sold electronically") both seem to be written for a paper book (i.e. "we might make the Work as a whole available via the World Wide Web") and seem to be in some contradiction or in unnecessary parallel with each other. Given that online, electronic distribution would be its primary (only?) possible revenue stream, if there is to be a revenue stream at all, since it is my current understanding that the Work will be free on the MIT site (although this is not stipulated in the contract), I'd like this all to be clarified and probably rewritten.
- 5) Materials Created by **Other Persons**: To be clear, I do not have permissions for most of the YouTube videos that the work points to, which sit on YouTube and not on the Work.
- 6) **Upkeep**, repairs, hosting of the infrastructure, database and Work: Who is responsible for this? Where does it sit? Where does it go after three years? How is it preserved?
- 7) **Editing**, Proofing: Unclear how this will be done given the unique quality of the material in the Work: i.e. design, words, videos. I certainly want it to be edited and proofed but how and by whom?
- 8) Author's **Alterations**: We need to decide whether the Work will be adapted, in that it is live, and easily updatable, added to, commented upon etc. or if it stays still once delivered (more like a paper book).
- 9) **Promotion**: given the unique nature of the Work, its economic model, and its final shape and home, I am interested in thinking through where and how the Press will promote it and otherwise let its audience know about its presence and availability.
- 10) **Index**: The Work has a search function and thus I will not need to make an index.

I look forward to working all this through. I understand that most of these concepts are new for the Press (and me) and am open to hashing them out in ways that make

the best sense for all concerned. Meanwhile, I am busy revising the Work as we speak. All the best, Alex

PS: I would like to ask your permission to “publish” some version of this (and other emails) concerning our ongoing discussions about publishing the Work, first on my blog, and then perhaps in the Work itself. As you know, the self-referential quality of the Work – discussing its own status as an object of writing, pedagogy, social-networked scholarship, activist intellectualism, and digital humanities publishing – would be well-served by including this final stage of its production, process, and conceptualization within itself.

Conclusions Regarding the Shape of What is Missing

The future of new media writing and publishing will be made online by young scholars and students who write lively, multi-modal missives using communication and digital technologies to network their analysis and experiences of their lived media environments. It is my hope that by creating and holding this unstable space of writing and publishing, I lay claim to its legitimacy for the less institutionally entrenched, who follow me, and also lead me, into new media's future. I hope that the stable and unstable deconstructing frame of this essay – the (changing) roles played by control, knowledge, form, and reflexivity in new media studies' future – allows us to see that academic styles, methods, and audiences adapt in ways that are productive and dynamic. I also hope that the shape of what is missing is how far academic publishing and writing, on paper, can go so as to match the technological possibilities for writing, research, and public intellectualism afforded by new media.

Media Visualization

Visual Techniques for Exploring Large Media Collections

Lev Manovich

ABSTRACT

Over the last 20 years, information visualization became a common tool in science and also a growing presence in the arts and culture at large. This chapter outlines a taxonomy of new visualization techniques particularly useful for media research, what Manovich calls “media visualization.” Where information visualization involves translating the world into numbers and then visualizing the relationship between those numbers, media visualization involves translating a set of images into another image that can reveal patterns that might not otherwise be apparent in the collection of images. Using the open source image processing software called ImageJ (normally used in medical research and other scientific fields), Manovich and his collaborators have designed a set of tools for media visualization that can be used by other researchers interested in exploring large sets of images, even without knowing exactly what they are looking for beforehand. The techniques outlined here are based on the work in visualization of patterns in cinema, TV, animation, videogames, and other media carried out in the Software Studies Initiative at the University of California, San Diego.

Some of the illustrations for this chapter are available only online at:

<http://lab.softwarestudies.com/p/media-visualizations-illustrations.html>.

Introduction: How to Work with Massive Media Data Sets

Early twenty-first-century media researchers have access to unprecedented amounts of media – more than they can possibly study, let alone simply watch or even search. A number of interconnected developments that took place between 1990 and 2010 – the digitization of analog media collections, a decrease in prices and expanding capacities of portable computer-based media devices (laptops, tablets, phones, cameras, etc.), the rise of user-generated content and social media, and globalization, which increased the number of agents and institutions producing media around the world – led to an exponential increase in the quantity of media while simultaneously making it much easier to find, share, teach with, and research. Millions of hours of television programs already digitized by various national libraries and media museums, millions of digitized newspaper pages from the nineteenth and twentieth centuries,¹ 150 billion snapshots of web pages covering the period from 1996 until today,² and hundreds of billions of videos on YouTube and photographs on Facebook (every day users upload 100 million images, according to the stats provided by Facebook in the summer of 2011) and numerous other media sources are waiting to be “digged” into. (For more examples of large media collections, see the list of repositories made available to the participants of the Digging Into Data 2011 Competition [Digging into Data Challenge, 2011].)

How do we take advantage of this new scale of media in practice? For instance, let’s say that we are interested in studying how presentation and interviews by political leaders are reused and contextualized by TV programs in different countries. (This example comes from our application for Digging Into Data 2011.) The relevant large media collections that were available at the time we were working on our application (June 2011) include 1,800 Barack Obama official White House videos, 500 George W. Bush Presidential Speeches, 21,532 programs from *Al Jazeera English* (2007–2011), and 5,167 *Democracy Now!* TV programs (2001–2011). Together, these collections contain tens of thousands of hours of video. We want to describe the rhetorical, editing, and cinematographic strategies specific to each video set, understand how different stations may be using the video of political leaders in different ways, identify outliers, and find clusters of programs that share similar patterns. But how can we simply watch all this material to begin pursuing these and other questions?

Even when we are dealing with large collections of still images – for instance, 167,00 images on “Art Now” Flickr gallery, 236,000 professional design portfolios on coroflot.com (both numbers as of 6/2011), or over 170,000 Farm Security

Administration (FSA)/Office of War Information photographs taken between 1935 and 1944 and digitized by Library of Congress³ – such tasks are no easier to accomplish. The basic method that always worked when numbers of media objects were small – see all images or video, notice patterns, and interpret them – no longer works.

Given the size of many digital media collections, simply seeing what's inside them is impossible (even before we begin formulating questions and hypotheses and selecting samples for closer analysis). Although it may appear that the reasons for this are the limitations of human vision and human information processing, I think that it is actually the fault of current interface designs. Popular interfaces for massive digital media collections such as list, gallery, grid, and slide (the example from the Library of Congress Prints and Photographs site) do not allow us to see the contents of a whole collection. These interfaces usually display only a few items at a time. This access method does not allow us to understand the “shape” of the overall collection and notice interesting patterns.

Most media collections contain some kind of metadata such as author names, production dates, program titles, image formats, or, in the case of social media services such as Flickr, upload dates, user-assigned tags, geodata, and other information.⁴ If we are given access to such metadata for a whole collection in the easy-to-use form such as a set of spreadsheets or a database, this allows us to at least understand distributions of content, dates, access statistics, and other dimensions of the collection. Unfortunately, usually online collections and media sites do not make available the complete collection's metadata to the users. Even if they did, this still would not substitute for directly seeing, watching, or reading the actual media. Even the richest metadata available today for media collections do not capture many patterns that we can easily notice when we directly watch video, look at photographs, or read texts – i.e., when we study the media themselves as opposed to metadata about them.⁵

The popular media access technologies of the nineteenth and twentieth centuries, such as slide lanterns, film projectors, microforms, Moviola and Steenbeck, record players, audio and videotape recorders, were designed to access single media items at a time at a limited range of speeds. This went hand in hand with the organization of media distribution: record and video stores, libraries, television, and radio would make available only a few items at a time. For instance, you could not watch more than a few TV channels simultaneously, or borrow more than a few videotapes from a library.

At the same time, hierarchical classification systems used in library catalogs made it difficult to browse a collection or navigate it in orders not supported by catalogs. When you walked from shelf to shelf, you were typically following a classification system based on subjects, with books organized by author names inside each category.

Together, these distribution and classification systems encouraged twentieth-century media researchers to decide beforehand what media items to see, hear, or read. A researcher usually started with some subject in mind – films by a particular author, works by a particular photographer, or categories such as “1950s experimental American films” and “early twentieth-century Paris postcards.” It was impossible

to imagine navigating through all films ever made or all postcards ever printed. (One of the first media projects that organizes its narrative around navigation of a media archive is Jean-Luc Godard's *Histoire(s) du cinéma*, which draws samples from hundreds of films.) The popular social science method for working with larger media sets in an objective manner – content analysis, i.e., tagging of semantics in a media collection by several people using a predefined vocabulary of terms (for more details, see Stemler, 2001) – also requires that a researcher decide beforehand what information would be relevant to tag. In other words, as opposed to exploring a media collection without any preconceived expectations or hypotheses – just to “see what is there” – a researcher has to postulate “what is there,” i.e., what are the important types of information worth seeking out.

Unfortunately, the current standard in media access – computer search – does not take us out of this paradigm. The search interface is a blank frame waiting for you to type something. Before you click on the search button, you have to decide what keywords and phrases to search for. So while the search brings a dramatic increase in speed of access, its deep assumption (which we may be able to trace back to its origins in the 1950s, when most scientists did not anticipate how massive digital collections would become) is that you know beforehand something about the collection worth exploring further.

The hypertext paradigm that defined the web of the 1990s likewise only allows a user to navigate though the web according to the links defined by others, as opposed to moving in any direction. This is consistent with the original vision of hypertext as articulated by Vannevar Bush in 1945: a way for a researcher to create “trails” though massive scientific information and for others to be able to follow those traces later.

My informal review of the largest online institutional media collections available today (europeana.org, archive.org, artstor.com, etc.) suggests that the typical interfaces they offer combine nineteenth-century technologies of hierarchical categories and mid-twentieth-century technology of information retrieval (i.e., search using metadata recorded for media items). Sometimes collections also have subject tags. In all cases, the categories, metadata, and tags were entered by the archivists who manage the collections. This process imposes particular orders on the data. As a result, when a user accesses institutional media collections via their websites, she can only move along a fixed number of trajectories defined by the taxonomy of the collection and types of metadata.

In contrast, when you observe a physical scene directly with your eyes, you can look anywhere in any order. This allows you to quickly notice a variety of patterns, structures, and relations. Imagine, for example, turning the corner on a city street and taking in the view of the open square, with passersby, cafés, cars, trees, advertising, store windows, and all other elements. You can quickly detect and follow a multitude of dynamically changing patterns based on visual and semantic information: cars moving in parallel lines, houses painted in similar colors, people who move along their own trajectories and people talking to each other, unusual faces, shop windows that stand out from the rest, and so on.

We need similar techniques that would allow us to observe vast “media universes” and quickly detect all interesting patterns. These techniques have to operate with speeds many times faster than the normally intended playback speed (in the case of time-based media). Or, to use the example of still images, I should be able to see important information in one million images in the same amount of time it takes me to see it in a single image. These techniques have to compress massive media universes into smaller observable media “landscapes” compatible with the human information processing rates. At the same time, they have to keep enough of the details from the original images, video, audio, or interactive experiences to enable the study of the subtle patterns in the data.

Media Visualization

The limitations of the typical interfaces to online media collections also apply to interfaces of software for media viewing, cataloging, and editing. These applications allow users to browse through and search image and video collections, and display image sets in an automatic slide show or a PowerPoint-style presentation format. However, as research tools, their usefulness is quite limited. Desktop applications such as iPhoto, Picasa, and Adobe Bridge, and image sharing sites such as Flickr and Photobucket, can only show images in a few fixed formats – typically a two-dimensional grid, a linear strip, or a slide show, and, in some cases, a map view (photos superimposed on the world map). To display photos in a new order, a user has to invest time in adding new metadata to all of them. She cannot automatically organize images by their visual properties or by semantic relationships. Nor can she create animations, compare collections that each may have hundreds of thousands of images, or use various information visualization techniques to explore patterns across image sets.

Graphing and visualization tools that are available in Google Docs, Excel, Tableau,⁶ manyeyes,⁷ and other graphing, spreadsheet, and statistical software do offer a range of visualization techniques designed to reveal patterns in data. However, these tools have their own limitations. A key principle, which underlies the creation of graphs and information visualizations, is the representation of data using points, bars, lines, and similar graphical primitives. This principle has remained unchanged from the earliest statistical graphics of the early nineteenth century to contemporary interactive visualization software that can work with large data sets (Manovich, 2011). Although such representations make clear the relationships in a data set, they also hide the objects behind the data from the user. While this is perfectly acceptable for many types of data, in the case of images and video this becomes a serious problem. For instance, a 2D scatter plot that shows a distribution of grades in a class with each student represented as a point serves its purpose, but the same type of plot representing stylistic patterns over the course of an artist’s career by means of points has more limited use if we cannot see the images of the artworks.

Figure 4.1 Exploring a visualization of one million manga pages on the HIPerSpace visual supercomputer. *Source:* Lev Manovich. <http://www.flickr.com/photos/culturevis/5866777772/>

Since 2008, our Software Studies Initiative at the University of California, San Diego, has been developing visual techniques that combine the strengths of media viewing applications and graphing and visualization applications.⁸ Like the latter, they create graphs to show relationships and patterns in a data set. However, if plot-making software can only display data as points, lines, or other graphic primitives, our software can show all the images in a collection superimposed on a graph. We call this approach *media visualization*.

Typical information visualization involves first translating the world into numbers and then visualizing relations between these numbers. In contrast, media visualization involves translating a set of images into a new image that can reveal patterns in the set. In short, pictures are translated into pictures.

Media visualization can be formally defined as *creating new visual representations from the visual objects in a collection* (Manovich, 2012a). In the case of a collection containing single images (for instance, the already mentioned 1930s FSA photographs collection from the Library of Congress), media visualization involves displaying all images, or their parts, organized in a variety of configurations according to their metadata (dates, places, authors), content properties (for example, presence of faces), and/or visual properties. If we want to visualize a video collection, it is usually more convenient to select key frames that capture the properties and the patterns of video. This selection can be done automatically using a variety of criteria – for example, significant changes in color, movement, camera position, staging, and other aspects of cinematography, changes in content such as shot and scene boundaries, start of music or dialogue, new topics in characters’ conversations, and so on.

Our media visualization techniques can be used independently, or in combination with *digital image processing* (Digital image processing, n.d.). Digital image processing is conceptually similar to automatic analysis of texts already widely used in digital humanities (Text Analysis, 2011). Text analysis involves automatically extracting various statistics about the content of each text in a collection, such as word usage frequencies, their lengths, and their positions, sentence lengths, and noun and verb usage frequencies. These statistics (referred to in computer science as “features”) are then used to study the patterns in a single text, relationships between texts, literary genres, and so on.

Similarly, we can use digital image processing to calculate statistics about various visual properties of images: average brightness and saturation, the number and the properties of shapes, the number of edges and their orientations, key colors, and so on. These features can then be used for similar investigations – for example, the analysis of visual differences between news photographs in different magazines or between news photographs in different countries, the changes in visual style over the career of a photographer, or the evolution of news photography in general over the twentieth century. We can also use them in a more basic way – for the initial exploration of any large image collection. (This method is described in detail in Manovich, 2012a.)

In the remainder of this chapter, I focus on media visualization techniques that are similarly suitable for initial exploration of any media collection but do not require digital image processing of all the images. I present the key techniques and illustrate them with examples drawn from different types of media. Researchers can use a variety of software tools and technologies to implement these techniques – scripting Photoshop, using open source media utilities such as ImageMagick,⁹ or writing new code in Processing,¹⁰ for example. In our lab we rely on the open source image processing software called ImageJ.¹¹ This software is normally used in biological and medical research, astronomy, and other scientific fields. We wrote many custom macros, which add new capacities to existing ImageJ commands to meet the needs of media researchers. (You can find these macros, detailed tutorials on how to use them, and sample data sets on our site.¹²) These macros allow you to create all types of visualizations described in this chapter, and also to do basic visual feature extraction on any number of images and videos. In other words, these techniques are available right now to anyone interested in trying them on their own data sets.

We have also developed a version of our tools that runs on the next generation visual supercomputer systems such as HIPerSpace, developed at Calit2 (California Institute for Telecommunication and Information) where our lab is housed.¹³ In its present configuration, it consists of seventy 30-inch monitors, which offer a combined resolution of 287 megapixels. We can load up to 10,000 images at one time and then interactively create a variety of media visualizations in real time (see Figure 4.1).

The development of our tools was driven by research applications. Since 2009, we have used our software for the analysis and visualization of over 20 different image and video collections covering a number of fields. The examples include 776 paintings by Vincent van Gogh, 4,535 covers of *Time* magazine published between 1923 and 2009 (see Figure 2 online and Figure 4.3), one million manga (Japanese comics)

pages, a hundred hours of gameplay video, and 130 Obama weekly video addresses (2009–2011). The software has also been used by undergraduate and graduate students at the University of California, San Diego (UCSD), in art history and media classes. In addition, we collaborate with cultural institutions that are interested in using our methods and tools with their media collections and data sets: *New York Times*, the Getty Research Institute, Austrian Film Museum, Netherlands Institute for Sound and Image, and Magnum Photos. Finally, we have worked with a number of individual scholars and research groups from UCSD, University of Chicago, UCLA, University of Porto in Portugal, and Singapore National University, applying these tools to visual data sets in their respective disciplines – art history, film and media studies, dance studies, and area studies.

Our software has been designed to work with image and video collections of *any* size. Our largest application to date is the analysis of one million pages of fan-translated manga (Douglass, Huber, & Manovich, 2011); however, the tools do not have built-in limits and can be used with even larger image sets.

Dimensions of Media Visualization

In this section I discuss media visualization methods in relation to other methods for analyzing and visualizing data. As I have already noted, media visualization can be understood as the opposite of statistical graphs and information visualization.

Media visualization can also be contrasted with content analysis (manual coding of a media collection typically used to describe semantics) and automatic media analysis methods commonly used by commercial companies (video fingerprinting, content-based image search, cluster analysis, concept detection, image and video mining, etc.). In contrast to content analysis, media visualization techniques do not require the time-consuming creation of new metadata about media collections. And, in contrast to automatic computational methods, media visualization techniques do not require specialized technical knowledge and can be used by anybody with only a basic familiarity with digital media tools (think QuickTime, iPhoto, and Excel).

The media visualization method exploits the fact that image collections typically contain at least minimal metadata. These metadata define how the images should be ordered, and/or group them in various categories. In the case of digital video, the ordering of individual frames is built-in to the format itself. Depending on the genre, other higher-level sequences can be also present: shots and scenes in a narrative theme, the order of subjects presented in a news program, the weekly episodes of a TV drama.

We can exploit this already-existing sequence of information in two complementary ways. On the one hand, we can bring all images in a collection together in the order provided by metadata. For example, in the visualizations of all 4,535 *Time* magazine covers, the images are organized by publication dates (see Figure 4.3). On the other hand, to reveal patterns that such an order may hide, we can also place the

images in new sequences and layouts. In doing this, we deliberately go against the conventional understanding of cultural image sets which metadata often reify. We call such conceptual operation “remapping.” By changing the accepted ways of sequencing media artifacts and organizing them in categories, we create new “maps” of our familiar media universes and landscapes.

Media visualization techniques can be also situated along a second conceptual dimension depending on whether they use all media in a collection, or only a sample. We may sample in *time* (using only some of the available images) or in *space* (using only parts of the images). An example of the former technique is the visualization of Dziga Vertov’s 1928 feature documentary *The Eleventh Year*, which uses only the first frame of each shot (see Figure 4.8). An example of the latter is the “slice” of 4,535 covers of *Time* magazine that uses only a single-pixel vertical line from each cover.

The third conceptual dimension that also helps us to sort out possible media visualization techniques is the sources of information they use. As already explained, media visualization exploits the presence of at least minimal metadata in a media collection, so it does not require the addition of new metadata about the individual media items. However, if we decide to add such metadata – for example, content tags created via manual content analysis, labels that divide the media collection into classes generated via automatic cluster analysis, automatically detected semantic concepts, face detection results, and visual features extracted with digital image processing – all this information can also be used in visualization.

In fact, media visualization offers a new way to work with this information. For example, consider information about content we added manually to our *Time* covers data set, such as whether each cover features portraits of particular individuals or, conversely, a conceptual composition that illustrates some concept or issue. Normally a researcher would use graphing techniques such as a line graph to display this information. However, we can also create a high-resolution visualization that shows all the covers and uses red borders to highlight the covers that fall in one of these categories (see Figure 2 at <http://lab.softwarestudies.com/p/media-visualizations-illustrations.html>).

The rest of this chapter discusses some of these distinctions in more detail, illustrating them with visualization examples created in our lab. Section 1 starts with the simplest technique: using all images in a collection and organizing them in a sequence defined by existing metadata. Section 2 focuses on temporal and spatial sampling. Section 3 discusses and illustrates the operation of remapping.

Media Visualization Techniques

1 Zoom Out (Image Montage)

Conceptually and technically, the simplest technique is to bring a number of related visual artifacts together and show them in a single image. Since media collections

always come with some kind of metadata such as creation or upload dates, we can organize the display of the artifacts using information in these metadata.

This technique can be seen as an extension of the most basic intellectual operations of media studies and humanities – comparing a set of related items. However, if twentieth-century technologies only allowed for a comparison between a small number of artifacts at the same time – for example, the standard lecturing method in art history was to use two slide projectors to show and discuss two images side by side – today’s applications running on standard desktop computers, laptops, notebooks, tablets, and the web allow for simultaneous display of thousands of images in a grid format. These image grids can be organized by any of the available metadata such as year of production, country, creator name, image size, or upload dates. As already discussed above, all commonly used photo organizers and editors including iPhoto, Picasa, Adobe Photoshop, and Apple Aperture include this function. Similarly, image search services such as Google Image Search and content sharing services such as Flickr and Picasa also use image grid as a default interface.

However, it is more convenient to construct image grids using dedicated image processing software such as ImageMagick or ImageJ, since they provide many more options and greater control. ImageJ calls the appropriate command to make image grids “make montage” (“Make Montage,” *ImageJ User Guide*, n.d.), and since this is the software we commonly use in our lab, we will refer to such image grids as *montages*.

This quantitative increase in the number of images that can be visually compared leads to a qualitative change in the type of observations that can be made. Being able to display thousands of images simultaneously allows us to see gradual historical changes over time, the images that stand out from the rest (i.e., outliers), and the differences in variability between different image groups. It also allows us to detect possible clusters of images that share some characteristics in common, and to compare the shapes of these clusters. In other words, montage is a perfect technique for “exploratory media analysis.”

To be effective, even this simple technique may still require some transformation of the media being visualized. For example, in order to be able to observe similarities, differences, and trends in large image collections, it is crucial to make all images the same size. We also found that it is best to position images side by side without any gaps (that is why typical software for managing media collections, which leaves such gaps in the display, is not suited for discovering trends in image collections).

The following example illustrates the image montage technique.

Placing 4,535 *Time* magazine covers published over 86 years within a single high-resolution image reveals a number of historical patterns, including the following:

- *Medium*: In the 1920s and 1930s *Time* covers use mostly photography. After 1941, the magazine switches to paintings. In the later decades, photography gradually comes to dominate again. In the 1990s we see the emergence of the contemporary software-based visual language, which combines manipulated photography and graphic and typographic elements.

Figure 4.3 Montage of all 4,535 covers of *Time* magazine organized by publication date (1923 to 2009) from left to right and top to bottom. A large percentage of the covers included color borders. We cropped these borders and scaled all images to the same size to allow a user to see more clearly the temporal patterns across all covers. *Source:* Jeremy Douglass and Lev Manovich, 2009. <http://www.flickr.com/photos/culturevis/4038907270/in/set-72157624959121129/>

- *Color vs. black and white*: The shift from early black-and-white to full-color covers happens gradually, with both types coexisting for many years.
- *Hue*: Distinct “color periods” appear in bands: green, yellow/brown, red/blue, yellow/brown again, yellow, and a lighter yellow/blue in the 2000s.
- *Brightness*: The changes in brightness (the mean of all pixels’ grayscale values for each cover) follow a similar cyclical pattern.
- *Contrast and saturation*: Both gradually increase throughout the twentieth century. However, since the end of the 1990s, this trend is reversed: recent covers have lower contrast and lower saturation.
- *Content*: Initially most covers are portraits of individuals set against neutral backgrounds. Over time, portrait backgrounds change to feature compositions representing concepts. Later, these two different strategies come to coexist: portraits return to neutral backgrounds, while concepts are now represented by compositions that may include both objects and people – but not particular individuals.

The visualization also reveals an important “meta-pattern”: almost all changes are gradual. Each of the new communication strategies emerges slowly over a number of months, years, or even decades.

Montage technique has been pioneered in digital art projects such as *Cinema Redux* (Dawes, 2004) and *The Whale Hunt* (Harris, 2007). To create their montages, artists wrote their custom code; in each case, the code was used with particular data sets and not released for others to use with other data. ImageJ software, however, allows easy creation of image montages without the need to program. We found that this technique is very useful for exploring any media data set that has a time dimension, such as shots in a movie, covers and pages of magazine issues, or paintings created by an artist in the course of her career.

Although the montage method is the simplest technically, it is quite challenging to characterize it theoretically. Given that information visualization normally takes data that are not visual and represents them in a visual domain, is it appropriate to think of montage as a visualization method? To create a montage, we start in the visual domain and end up in the same domain – that is, we start with individual images, put them together, and then zoom out to see them all at once.

We believe that calling this method “visualization” is justified if, instead of focusing on the transformation of data characteristic of information visualization (from numbers and categories to images), we focus on its other key operation: arranging the elements of visualization in such a way as to allow the user to easily notice the patterns that are hard to observe otherwise. From this perspective, montage is a legitimate visualization technique. For instance, the current interface of Google Books can only show a few covers of any magazine (including *Time*) at a time, so it is hard to observe the historical patterns. However, if we gather all the covers of a magazine and arrange them in a particular way (making their size the same and displaying them in a rectangular grid in publication date order – i.e., making

everything the same so the eye can focus on comparing what is different – their content), these patterns are now easy to see. (For further discussion of the relations between media visualization and information visualization, see Manovich, 2011.)

2 Temporal and Spatial Sampling

Our next technique adds another conceptual step. Instead of displaying all the images in a collection, we can *sample* them using some procedure to select their subsets and/or their parts. *Temporal sampling* involves selecting a subset of images from a larger image sequence. We assume that this sequence is defined by existing metadata, such as frame numbers in a video, upload dates of user-generated images on a social media site, or page numbers in a manga chapter. The selected images are then arranged back-to-back, in the order provided by the metadata.

Temporal sampling is particularly useful in representing cultural artifacts, processes, and experiences that unfold over significant periods of time – such as playing a videogame. Completing a single-player game may take dozens and even hundreds of hours. In the case of massively multiplayer online role-playing games (MMORPG), users may be playing for years. (A 2005 study by Nick Yee found the MMORPG players spend an average of 21 hours per week in the game world.)

We created two visualizations that together capture 100 hours of gameplay of *Kingdom Hearts* (2002, Square Co., Ltd.) and *Kingdom Hearts II* (2005, Square-Enix, Inc.) (see Figures 4 and 5 at <http://lab.softwarestudies.com/p/media-visualizations-illustrations.html>). Each game was played from beginning to end over a number of sessions. The video captured from all game sessions of each game was assembled into a single sequence. The sequences were sampled at six frames per second. This resulted in 225,000 frames for *Kingdom Hearts* and 133,000 frames for *Kingdom Hearts II*. The visualizations use every tenth frame from the complete frame sets. Frames are organized in a grid in order of gameplay (left to right, top to bottom).

Kingdom Hearts is a franchise of videogames and other media properties created in 2002 via a collaboration between Tokyo-based videogame publisher Square (now Square-Enix) and The Walt Disney Company. The franchise includes original characters created by Square, traveling through worlds representing Disney-owned media properties (e.g., *Tarzan*, *Alice in Wonderland*, *The Nightmare Before Christmas*, etc.). Each world has its distinct characters derived from the respective Disney-produced films. It also features distinct color palettes and rendering styles, which are related to visual styles of the corresponding Disney film. Visualizations reveal the structure of the gameplay, which cycles between progressing through the story and visiting various Disney worlds.

Temporal sampling is used in the interfaces of some media collections – for instance, Internet Archive¹⁴ includes regularly sampled frames for some of the videos in its collection (sampled rates vary depending on the type of video). In computer science, many researchers are working on video summarization: algorithms to

Figure 4.6 Slice of 4,535 covers of *Time* magazine organized by publication date (from 1923 to 2009, left to right). Every one-pixel-wide vertical column is sampled from a corresponding cover. *Source:* Jeremy Douglass and Lev Manovich, 2009. <http://www.flickr.com/photos/culturevis/4040690842/in/set-72157622525012841>

automatically create compact representations of video content which typically produce a small set of frames (the search for “video summarization” on Google Scholar returned 17,600 articles). Since applying these algorithms does require substantial technical knowledge, we promote much simpler techniques that can be carried out without such knowledge using built-in commands in ImageJ software.

Spatial sampling involves selecting *parts* of images, according to some procedure. For example, our visualization of *Time* covers used spatial sampling, since we cropped some of the images to get rid of the red borders. However, as the example below demonstrates, often more dramatic sampling, which leaves only a small part of an image, can be quite effective in revealing additional patterns that a full image montage may not show as well. Following the standard name for such visualizations as used in medical and biological research and in ImageJ software, we refer to them as *slices* (“Orthogonal Views”, *ImageJ User Guide*, n.d.).

Naturally, the question arises of the relations between the techniques for visual media sampling as illustrated here, and the standard theory and practice of sampling in statistics and social sciences. (For a very useful discussion of general sampling concepts as they apply to digital humanities, see Kenny, 1982.) While this question will require its own detailed analysis, we can make one general comment. Statistics is concerned with selecting a sample in such a way as to yield some reliable knowledge about the larger population. Because it was often not practical to collect data about the whole population, the idea of sampling was the foundation of the twentieth-century applications of statistics.

In creating media visualization, we often face similar limitations. For instance, in our visualizations of *Kingdom Hearts* we sampled the complete videos of gameplay using a systematic sampling method. Ideally, if ImageJ software was capable of creating a montage using all of the video frames, we would not have to do this.

However, as the *Time* covers slice visualization demonstrates, sometimes dramatically limiting part of the data is actually better for revealing certain patterns than using all the data. While we can also notice historically changing patterns in cover layout in full image montage (e.g., placement and size of the word “Time,” the size of images in the center in relation to the whole covers), using a single-pixel column from each cover makes them stand out more clearly.

The following two visualizations (Figures 4.7 and 4.8) further illustrate this idea. The first uses regular sampling (1fps) to represent a 60-minute film, *The Eleventh Year*,

Figure 4.7 Visualization of *The Eleventh Year* (Dziga Vertov, 1928). The film is sampled at one frame per second. The resulting 3,507 frames are organized left to right and top to bottom following their order in the film. Source: Dziga Vertov, *The Eleventh Year*, 1928. <http://www.flickr.com/photos/culturevis/4052703447/in/set-72157622608431194>

Figure 4.8 Visualization of *The Eleventh Year* (Dziga Vertov, 1928). Every shot in the film is represented by its first frame. Frames are organized left to right and top to bottom following the order of shots in the film. Source: Dziga Vertov, *The Eleventh Year*, 1928. <http://www.flickr.com/photos/culturevis/3988919869/in/set-72157622608431194>

directed by Dziga Vertov (1928). The resulting representation of the film is not very useful. The second visualization follows semantically and visually important segmentation of the film – the shots sequence. Each shot is represented by its first frame. (The frames are organized left to right and top to bottom following shot order in the film.) Although this visualization uses a much smaller number of frames to represent the film than the first, it is much more revealing. We can think of it as a reverse-engineered imaginary storyboard of the film – a reconstructed plan of its cinematography, editing, and content.

3 Remapping

Any representation can be understood as a result of a mapping operation between two entities: the sign and the thing being signified. Mathematically, mapping is a function that creates a correspondence between the elements in two domains. A familiar example of such mapping is geometric projection techniques used to create two-dimensional images of three-dimensional scenes, such as isometric projection and perspective projection. Another example is 2D maps that represent physical spaces. We can think of the well-known taxonomy of signs defined by philosopher Charles Peirce – icon, index, symbol, and diagram – as different types of mapping between an object and its representation. (Twentieth-century cultural theory often stressed that cultural representations are always partial maps, since they can only show some aspects of the objects. However, this assumption needs to be rethought, given the dozens of recently developed technologies for capturing data about physical objects, and the ability to process massive amounts of data to extract features and other information. Google, for instance, performs this operation a few times a day as it analyzes over a trillion web links. For further discussion of this point, see Manovich, 2012b.)

While any representation is a result of a mapping operation, modern media technologies – photography, film, audio records, fax and copy machines, audio and video magnetic recoding, media editing software, the web – led to a new practice of cultural mapping: using an already-existing media artifact and creating new meaning or a new aesthetic effect by sampling and rearranging parts of this artifact. While this strategy was already used in the second part of the nineteenth century (photomontage), it became progressively more central to modern art since the 1960s. Its different manifestations include pop art, compilation film, appropriation art, remix, and a large part of media art – from Bruce Conner’s very first compilation film, *A Movie* (1958), to Dara Birnbaum’s *Technology/Transformation: Wonder Woman* (1979), Douglas Gordon’s *24 Hour Psycho* (1993), Joachim Sauter and Dirk Joachim’s *The Invisible Shapes of Things Past* (1995), Mark Napier’s *Shredder* (1998), Jennifer and Kevin McCoy’s *Every Shot/Every Episode* (2001), *Cinema Redux* by Brendan Dawes (2004), Natalie Bookchin’s *Mass Ornament* (2009), Christian Marclay’s *The Clock* (2011), and many others. While earlier remappings were done manually and had a small number

of elements, use of computers allowed artists to automatically create new media representations containing thousands of elements.

If the original media artifact, such as a news photograph, a feature film, or a website, can be understood as a “map” of some “reality,” an art project that rearranges the elements of this artifact can be understood as “remapping.” Such projects derive their meanings and aesthetic effects from systematically rearranging the samples of original media in new configurations.

In retrospect, many of these art projects can also be understood as media visualizations. They examine ideological patterns in mass media, experiment with new ways to navigate and interact with media, and defamiliarize our media perceptions.

The techniques described in this chapter already use some of the techniques explored earlier by artists. However, the practices of photomontage, film editing, sampling, remix, photomontage, and digital art are likely to contain many other strategies that can be appropriated for media visualization. Just as with the sampling issue, a more detailed analysis is required of the relationship between these artistic practices of media remapping and media visualization as a research method for media studies, but one difference is easy to describe.

Artistic projects typically sample media artifacts, selecting parts and then deliberately assembling these parts in new orders. For example, in a classical work of video art, titled *Technology/Transformation: Wonder Woman* (1979), Dara Birnbaum sampled the television series *Wonder Woman* to isolate a number of moments, such as the transformation of the woman into a superhero. These short clips were then repeated many times to create a new narrative. The order of the clips did not follow their order in the original television episodes.

In our case, we are interested in revealing the patterns across the complete media artifact or a series of artifacts. Therefore, regardless of whether we are using all media objects (such as in the *Time* covers montage or *Kingdom Hearts* montages) or their samples (the *Time* covers slice), we typically start by arranging them in the same order as in the original work. Additionally, rather than selecting samples to support our new message (communicating a new meaning, expressing our opinion about the work), we start by following a systematic sampling method – for instance, selecting every second frame in a short video, or a single frame from every shot in a feature film.

As already argued earlier, we also purposely experiment with new sampling orders and different spatial arrangements of the media objects in visualization. Such deliberate remappings are closer to the artistic practice of aggressive rearrangements of media materials – although our purpose is revealing the patterns that are already present, as opposed to making new statements about the world using media samples. Whether this purpose is realizable is an open question. It is certainly possible to argue that our remappings are reinterpretations of the media works which force viewers to notice some patterns at the expense of others.

As an example of remapping technique, consider the following visualization that uses the first and last frame of every shot in Vertov’s *The Eleventh Year*.

Figure 4.9 Visualization of *The Eleventh Year* (Dziga Vertov, 1928). Every shot in the film is represented by its first frame. Frames are organized left to right and top to bottom following the order of shots in the film. Every shot was analyzed using software to measure the average amount of movement across all frames in the shot. These measurements are plotted below the frames. Longer bars = more motion; shorter bars = less motion. *Source:* Dziga Vertov, *The Eleventh Year*, 1928. <http://www.flickr.com/photos/culturevis/4117658480/in/set-72157622608431194/>

“Vertov” is a neologism invented by the director who adapted it as his last name early in his career. It comes from the Russian verb *vertet*, which means “to rotate.” “Vertov” may refer to the basic motion involved in filming in the 1920s – rotating the handle of a camera – and also the dynamism of film language developed by Vertov who, along with a number of other Russian and European artists, designers, and photographers working in that decade, wanted to defamiliarize familiar reality by using dynamic diagonal compositions and shooting from unusual points of view. However, our visualization suggests a very different picture of Vertov. Almost every shot of *The Eleventh Year* starts and ends with practically the same composition and subject. In other words, the shots are largely static. Going back to the actual film and studying these shots further, we find that some of them are indeed completely static – such as the close-ups of people’s faces looking in various directions without moving. Other shots employ a static camera that frames some movement – such as working machines, or workers at work – but the movement is localized completely inside the frame (in other words, the objects and human figures do not cross the view framed by the camera). Of course, we may recall that a number of shots in Vertov’s most famous film, *Man with A Movie Camera* (1929), were specifically designed as opposites: shooting from a moving car meant that the subjects were constantly crossing the camera view. But even in this most experimental of Vertov’s films, such shots constitute a very small part of the film.

Conclusion

In this chapter we described visual techniques for exploring large media collections. These techniques follow the same general idea: use the content of the collection – all images, their subsets (temporal sampling) or their parts (spatial sampling) – and present it in various spatial configurations in order to make visible the patterns and the overall “shape” of a collection. To contrast this approach to the more familiar practice of information visualization, we call it “media visualization.”

We included examples that show how media visualization can be used with already-existing metadata. However, if researchers add new information to the collection, this new information can also be used to drive media visualization. For example, images can be plotted using manually coded or automatically detected content properties, or visual features extracted via digital image processing. In the case of video, we can also use automatically extracted or coded information about editing techniques, framing, presence of human figures and other objects, amount of movement in each shot, and so on.

Conceptually, media visualization is based on three operations: zooming out to see the whole collection (image montage), temporal and spatial sampling, and remapping (rearranging the samples of media in new configurations). Achieving meaningful results with remapping techniques often involves experimentation and time. The

first two methods usually produce informative results more quickly. Therefore, every time we assemble or download a new media data set, we next explore it using image montages and slices of all items.

Consider this definition of “browse” from *Wiktionary*: “To scan, to casually look through in order to find items of interest, especially without knowledge of what to look for beforehand” (“Browse,” n.d.). Also relevant is one of the meanings of the word “exploration”: “to travel somewhere in search of discovery” (“Explore,” n.d.). How can we discover interesting things in massive media collections? In other words, how can we browse through them efficiently and effectively, without prior knowledge of what we want to find? Media visualization techniques give us some basic ways of doing this.

ACKNOWLEDGMENTS

The research presented in this chapter was supported by an Interdisciplinary Collaboratory Grant, “Visualizing Cultural Patterns” (UCSD Chancellors Office, 2008–2010), Humanities High Performance Computing Award, “Visualizing Patterns in Databases of Cultural Images and Video” (NEH/DOE, 2009), Digital Startup Level II grant (NEH, 2010), and CSRO grant (Calit2, 2010). We also are very grateful to the California Institute for Information and Telecommunication (Calit2) and UCSD Center for Research in Computing and the Arts (CRCA) for their ongoing support. All the visualizations and software development are the result of systematic collaboration among the key lab members: Lev Manovich, Jeremy Douglass, Tara Zappel, and William Huber.

The Study of the Internet in Latin America

Achievements, Challenges, Futures

Raúl Trejo Delarbre

ABSTRACT

Latin American social research about the Internet and digital technologies has been defined by a multifaceted and copious development. Since the initial studies in the mid-1990s, researchers have attended to general issues like the digital divide, national and regional politics of Internet expansion, and the distinctively Latin American political and social expressions on the web. Gradually, that research was oriented toward more specific issues like citizenship on the Internet, cyber-journalism, the construction of personal relations, and, more recently, social networks. This chapter describes the trajectory of these studies and the arguments of leading Latin American scholars in this area. While the diverse collection of works that collectively comprise “Latin American Internet research” does not constitute a school with its own theoretical models, Trejo Delarbre explains, there are nevertheless common foci and priorities within this body of scholarship. The author recommends that his generation of media scholars seize their unique perspective, having experienced the transition from analog to digital and from mass media to Internet, with all of the disruptive challenges this transition has posed and imposed – especially in cultures so deeply defined by a lack of access for so many.

The first Latin American studies of the Internet adopted cautious approaches, stemming from curiosity and fear of a new technology that seemed to have implications for all walks of social life no one could manage to clearly understand. Those studies had the pioneering spirit of explorers navigating uncharted waters. Although they did not always transfer well from monographic description to in-depth analysis, these initial investigations had the charm of novelty, accentuated by the fact that they were scrutinizing a tool of communication that seemed to have great democratic potential. Topics that interested these early researchers included the way people used the Internet and its derivations and applications; early discussions about the implications for teaching, journalism, and the law; the hints of new forms of socialization; and the first discussions around issues like anonymity, the growing influence of intelligent machines, rights of the author, and the exercise of freedoms as vast as they were occasionally contradictory. Interpretations of the Internet in Latin America were influenced, to a significant degree, by these initial investigations.¹

In this chapter, I offer a quick look at some of the main authors, examining several of the principal issues in Latin American social research about the Internet, digital media, and the information society. Although this is a very broad, complex, and heterogeneous region, there are various factors that justify an overall approach. Latin American countries share cultural traditions and practices and, of course, a common language, which means similar ways of appropriation with respect to information and communication technologies (ICTs). Even in Brazil, with a different native language, the use and learning of the Spanish idiom has been extended in recent years.

During this first decade and a half of academic studies of the Internet, Latin American researchers, like their colleagues in other latitudes, were building methodologies, defining mutual doubts, and sharpening the focus of research topics. Strictly speaking, we cannot talk about a specifically Latin American focus on the study of the Internet in the same way we can with studies of conventional communication media. Some authors, like the Brazilian Marques de Melo (1999), have identified a Latin American characteristic style in media research, induced by the peculiarities of political regimes, economic conditions, and cultural identities. Some examples that have been repeated across the Latin American subcontinent include the role that the press played in backing or contradicting authoritarian governments or dictators; the high concentration of television frequencies in just a few hands, which left almost no room for public service television programming; and the versatility of radio, which, in addition to its fundamental commercial qualities, has been used by community groups. I am not claiming that this characterizes all media in a geographical and cultural space as varied and vast as Latin America, but these characteristics have led to similar focuses on the part of a number of researchers in the study of mass communication in this region. Further, the folkloristic or voluntaristic conceptions of a fuzzy Latin American spirit, the linguistic and social conditions, among others, have contributed to create a distinctly Latin American cultural space. As Néstor García Canclini (1999), a prominent specialist in cultural and media studies in

the region, explains the Latin American cultural territory: "The indigenous, the Afro-American, the European, the Latinity, the tropicality, etc., sometimes are convergent and, in another, separated" (p. 42).

The preeminence of two major analytical currents in the Latin American study of the media favored this similarity of focus. The first of these currents was functionalism, which originated primarily in US sociology. Functionalism was the theoretical goal of the first studies on communication media in a number of Latin American countries. Contrasting with this interpretive vein was the Marxist perspective, which circulated in the halls of our universities mainly during the 1970s and influenced many of the researchers who carried out the most well-known media studies during the following decades. During this time, the types of research and analysis that privileged the study of social contradictions were in conflict and represented different trends in Latin American media research. The conflict between these analytical currents has been overcome since the 1990s.

Those conditions have not been repeated, at least not in the same form, in Latin American studies about the Internet and new digital media. The expansion of the Internet has been one of the mechanisms of globalization of economies and cultures. The content and uses of this new technology, like its study, have expanded throughout varied latitudes, thanks to the Internet itself. The information exchange and discussion among scholars nowadays (even the acquisition of books, which was not easy a few decades ago) take place easily and rapidly over the Internet. Studies of the media, especially new media, come out so quickly that when enough interest is generated, they can be accessed almost simultaneously in any country. This situation, which influences the methods and mechanisms of academic work in any discipline, has particularly influenced studies of digital media. Those of us who looked for conceptual hooks or methods to study the Internet in the mid-1990s found foundational references in the works of Rheingold (1994), De Kerckhove (1995), Moore (1995), or Negroponte (1995). In Spanish, early commentators included the Spaniard Echeverría (1994) and, undoubtedly, Castells (1996, 1997, 1998, 2001, 2009). Manuel Castells's reflections about the Internet and the informational society have been well known among scholars worldwide. In Latin America, he is the most influential author on these issues.

In the 1990s, ideas and doubts about digital media did not circulate widely in Latin American universities, but they were attractive enough to at least pique the interest of researchers from various countries. Soon databases, statistics, and research results on the coverage of the Internet, and sometimes on the way people used it, began to spread. This information, posted online, could be accessed in Boston, San Francisco, and London, as well as in Buenos Aires, Santiago de Chile, and São Paulo. Those of us interested in these topics could follow the Internet's first steps, as the web began to gain notoriety and generate interest in society, practically from the outset. In addition to the wonder inspired by the new possibilities of the spread of information and interaction, which contrasted with the vertical model of the old media, we had the feeling that we were taking part in an unprecedented phenomenon.

From our university cubicles or from our own homes, using slow connections through telephone modems, and waiting minutes and sometimes hours for images or audiovisual files to download, those of us interested in the topic had the privilege of watching the social birth of the Internet. The technological inception of these changes had taken place through the improvement, in the 1970s, of the TCP/IP protocol that allowed the first computers to connect to this network, and later, around 1990, with the creation of the system of hypertext links that would weave the World Wide Web. But this communication resource was not introduced to a wider public until well into the last decade of the twentieth century, when the Internet started to expand throughout various regions, including Latin America.

The development of the Internet, along with its cultural and societal implications for our countries, has been part of the expansion of a globalization that has not displaced but has delimited local cultures. The digital divide continues to be a reality that we cannot ignore, despite our admiration for the flourishing of the information society. In 2010 in Latin America, approximately 32% of the population had an Internet connection (Internet World Stats, 2010). This was a monumental advance, especially if we consider that 12 years earlier, in 1998, just 1.5% of Latin Americans had access to the Internet (Trejo Delarbre, 1999, p. 262) and in 2003, only 8%. The fact that in 12 years this number grew more than 20 times, and that in eight years it quadrupled, shows the dizzying expansion of the Internet in this part of the world. But we must remember that still, in 2010, 68 out of every 100 Latin Americans lacked access to the Internet.

That intensive and extensive but irregular growth has had several consequences in the scholarly sphere. Although insufficient in many countries, the presence of the Internet in Latin America has garnered the attention, at times methodologically unorthodox, of a variety of fields. A diverse amalgam of disciplines, from engineering to sociology, philosophy, and anthropology, among others, has studied the modes, uses, and challenges of the development of the Internet in Latin America. From the lack of trust that seemed to prevail during the mid-1990s, when many were not aware of the Internet or considered it a simple instrument of ideological imposition, to the uncritical and excessively enthusiastic positions that mimicked analyses of the web from US authors, Latin American research has advanced a systematic and at times creative approach to Internet studies. This research has principally been carried out through the work of individual scholars, not through institutional efforts.

The interest in these issues has increased, especially in the last decade. Academic studies on the issue, no more than a dozen in 1996 and 1997, have stretched into the hundreds, or even thousands, if one takes into account university theses. Take just one example: at the Universidad Nacional Autónoma de México (UNAM) in 1995, two theses were submitted with topics related to the Internet. The following year there were six, and in 1997 there were 22. In total, between 1995 (the first year a thesis on the Internet was submitted) and 1999, there were 122 studies on this topic. Between 2000 and 2004, there were 388 studies; from 2005 to 2009, there were 495.²

The exchange between those interested in these issues continues to be precarious and the specialized forums are few. The Internet has been quickly accepted as a particular topic within Latin American studies of communication, especially in meetings of organizations like the Asociación Latinoamericana de Investigadores de la Comunicación (ALAIIC).³ But its recognition as a medium in its own right has been late – in comparison to European and North American countries – in the priorities of research centers and in specialized university communications curricula. What follows is an account, though inevitably fragmentary, of Latin American contributions and investigations in the study of the Internet.

Alejandro Piscitelli: From Cyberculture to Facebook

Few authors in Latin America have undertaken a panoramic review of the cultural effects and social presence of the Internet. Almost all of the studies, especially since 2000, have been focused on specific developments and problems with the production and reception of Internet content. Alejandro Piscitelli, a professor of philosophy at Universidad de Buenos Aires, has been a pioneer in thinking about cyberculture in Latin America.⁴ Piscitelli's own education, which took him from philosophy to systems science, encompasses a variety of perspectives that pertain to the study of the Internet. His classic book, *Ciberculturas: En la era de las máquinas inteligentes* (*Cybercultures: In the Era of Intelligent Machines*), was published in 1995 and reissued seven years later (Piscitelli, 2002a) with a number of new annotations and annexes. In that book, Piscitelli insists on several coordinates: technological and cultural changes cannot be understood separately; the interaction between men and machines is making the world increasingly complex and should be studied from an anthropological perspective; hypertext opens new frontiers to the collective construction of sense; and the imbrications between television and computer will displace the book.

Piscitelli has brought a Latin American, but not a regionalist, reading to topics like nanotechnology, hypermedia, virtual spaces, and, of course, the Internet. Two of his books (Piscitelli, 1998, 2001) have analyzed the overlap of conventional mass media like television, which reaches a wide audience, with the Internet, which connects directly to its users, as well as the failed hopes raised by financial speculation of the digital economy. In *Meta-Cultura* (2002b), Piscitelli elevates the subject of his reflections and asks about the implications new media will have not only on the information that our societies receive, but also on our ways of thinking about and understanding the world. In a rigorous bibliographic exploration, he examines the cognitive transformations that the Internet has enabled and dispersed across diverse terrains: language, technology, culture, knowledge, and communication.

In 2003 and for the following five years, Piscitelli temporarily left the university to get involved in public administration as the head of Educ.ar, the “educational portal for the Argentine nation.” However, he did not stop writing about these topics, and

in that time he published works like *Internet, la imprenta del siglo XXI* (*Internet, the Twenty-First Century's Printing Press*, 2005), where he discusses the emergence of blogs, the distribution of online content, and the educational uses of the Internet, among other topics. Piscitelli's practice with developing educational content, his teaching work in the Universidad de Buenos Aires, and his passion for the capacity of this new medium to articulate interests, affinities, and people, led him to create "El Proyecto Facebook," or The Facebook Project (<http://www.proyectofacebook.com.ar>), with professors and students in the Introduction to Computer Science course in the Social Sciences department. The project involved research into the uses of Facebook, especially in learning. At the same time, it was an experiment in the use of the online social network as a space of exchange and discussion among students and teachers.⁵ In the effort to *think with images* ("pensar con imágenes"), Piscitelli and his more than 250 colleagues and students made videos, photographs, blogs, and other content in what they called an experience of participative education. The account of that experience (Piscitelli, Adaime, & Binder, 2010) included commentary from other Latin American professors, offering a precise and timely reflection on the abilities of online social networks to be used as a platform for learning, as well as a new way to impart, create, spread, and evaluate knowledge.

In an orthodox and pedagogically rigid environment like the one that still exists in many Latin American universities, Piscitelli's Facebook Project, developed between 2008 and 2010, was an innovative experiment. Piscitelli is one of the few Latin American scholars who has followed the Internet step by step. The continuity in this work, from his initial conceptual reflections in the 1990s to his experimentation with Facebook, has been pioneering in the Latin American research in this field.

The Information Society and the Digital Divide

The Internet's expansion brought critical approaches from the Latin American social sciences. In particular, the cardinal options outlined by Umberto Eco (1964) in his essential book from the mid-1960s – the apocalyptic and the integrated views – found a central place in the scholarly discussion about the web and its social implications. The broad view of the Internet's social and cultural implantation in Latin America was explained, in panoramic takes, by authors like Sánchez (1997) and Flores Olea and Gaspar de Alba (1997). They were the first to recognize the rapidity of Internet development and to claim that this new technological resource could have liberating uses and effects, but only accompanied by adequate public policies. Sánchez (1997) anticipated both the virtues and the limitations of the Internet. He noted that "the Internet unifies knowledge horizontally," and that it is not the solution to our societies' cultural deficiencies; "nor is it adequate to think that the Internet itself could be the solution to global civil growth, given that the majority of the Internet will be put to quite frivolous use, for entertainment and the like" (p. 61).

Latin American research has focused not only on the Internet as a technology, but also more broadly on the information society as a political, social, and economic formation, starting with discussions about the various implications of the concept. Notably, some scholars considered the notion of an "information society" too panegyric, while for others it was itself a diagnosis of a growing reality, though one that was not always advantageous as it replicated a number of social inequities. Some scholars maintained that the information society did not amount (at least mechanically) to an entirely new society, nor did it mean the improvement of the whole society. With that analytical frame, Crovi Druetta (2004a) and the authors gathered in her book argue that the information society amounts to more of a global patchwork of change than an entirely unique and distinct era. The key to understanding and advancing information and knowledge expansion, they maintain, is public policy actively developed by Latin American governments. However, this is one of the shortfalls or limitations suffered by Latin American countries. In my early work on the Internet (Trejo Delarbre, 1996), I analyzed such public policies in several regions. More recently, the Peruvian Villanueva (2005) has examined the usefulness of the Internet in public administration. Though less abundant, there are also critical reflections on the realities and very definition of the information society, most notably that of Pasquali (2003) from Venezuela. Pasquali has underlined several paradoxes. "Rather than an information society," he writes, "ours is, more accurately, a 'computerized' civilization, an information-dependent one, to a degree directly proportional to the wealth of a country" (p. 219). Without underestimating the Internet's social and political relevance, Pasquali's work highlights the influence of corporations that are behind the expansion of digital connections and resources.

These studies and others like them offer more of a panoramic perspective than specific views about the information society and its emergence in Latin America. Especially in its early years, scholarly production related to the Internet was dominated by these more global perspectives. The Venezuelans Peña and Martínez (2008) have expressed concern for the scarcity of research that highlights the local:

We need to apply a local perspective to what is generalized globally, in order to avoid falling victim to the simple imitation of other contexts and a lack of adequate analysis and discernment of the specific realities of each country in relation to its own economic, political, social, and cultural issues. When this is not examined, we fall victim to technological alienation, assuming distant realities as our own and, consequently, ignoring the importance of the local. (p. 78)

Beyond the academy (but with its participation), the primary debate on the Internet in Latin America, especially in the final years of the twentieth century, revolved around the disjuncture between investing resources in technological infrastructure while failing to meet other social needs. In reality, the connection-versus-food dilemma so often invoked in these discussions is a false one. If a country or society does not have even the most minimal of comforts, including literacy, electricity, and

telephone lines, then it will not have the material support to even introduce the Internet. But we can also recognize that this infrastructure is an indispensable part of development. These issues have been studied by Ricardo Gómez (2000), an Argentinean who resides in Canada, as well as by various multilateral organizations. Gómez remarks that information technologies are neither positives nor negatives, but neither are they neutral. They depend on the shape and direction of the societies in Latin America, where the access to informational resources is unevenly distributed. In spite of the communitarian telecenters, the majority of users constitute an elite group who are interconnected with the global market, with greater access to information, education, and other opportunities. This perspective on the Internet, which views it as an instrument that expands the gap between richest and poorest, was frequent in many diagnoses. However, authors like Gómez went beyond this view to insist on the development of a form of politics capable of creating and guaranteeing the social right to communication.

In an evaluation of the development of the information society in Latin America, presented in early 2003, the Comisión Económica para América Latina y el Caribe (CEPAL, Economic Commission on Latin America and the Caribbean) conceived the new information and communication technologies as

something more than technology and computers, given that they do not function as an isolated system, but in connection with other systems through a network. They are also more than technologies of emission and diffusion (like television and radio), as they not only provide information, but also enable interactive communication. (CEPAL, 2003, p. 5)

As a regional organization, CEPAL proposed to establish regulatory frames, which included, among other public policy actions, financing programs for connections coverage (especially wireless) and computer equipment with free software, ICT development in public education, special programs for the elderly, coordination between governmental offices in charge of these policies, and regional alliances (by several countries) to acquire hardware at lower prices from the transnational corporations.

In 2003 the Asociación Latinoamericana de Integración (ALADI, Latin American Association for Integration) published an extensive study on the limitations of connectivity in the region. Typically, research and discussion about the digital divide focused on the availability of connections. This study, in addition to the traditional understandings of the digital divide, proposed a methodology that took into account not only the proportion of Internet users, but also telephone coverage, the density of computers per person, and each country's economic situation (ALADI, 2003). The digital divide, according to the study, "describes the difference between countries, sectors and people with access to information implements and tools and the capacity to use them, and, in addition, those who do not have access, regardless of whether they have the capacity." The study was completed by Rodrigo Díaz (Chile), Oscar A.

Messano (Argentina), and Ricardo Petrissans (Uruguay). In addition, Petrissans produced the website “Sociedad Digital” (Digital Society) (www.sociedaddigital.org), which published an abundance of information on Internet public policy.

Latin American scholars have examined another dimension of the digital divide – that is, the question of a gender divide in Internet use. A question revisited over the past 15 years is how women in Latin American countries use the Internet. In a helpful review of former investigations, the Argentinean researcher Bonder (2002) describes the gender gap in access to technologies and suggests new angles for additional studies. Questions include, among others, how to increase women’s access and training with ICTs, especially poor women; how to promote equal participation in decisions about the use of communications infrastructure (in both national and international institutions); and how to achieve an equal distribution of cyberspace in international organizations. Coca (2003) studied how the Internet had been used to increase women’s political participation in Bolivia, Guatemala, and the Dominican Republic. Later, Leao, Lapa, and Amoroso (2009) documented the role of new technologies in both spreading stereotypes and denouncing violence against women in Brazil.

As this research suggests, the “digital divide” is a complex, multifaceted problem. Another effort to problematize any straightforward conceptualization of the digital divide is found in González (2008), who challenges whether it can be approached in the same way in every circumstance. González criticizes the overwhelming tendency to focus on the physical lack of connections while ignoring other deficiencies in ICT use. He also questions the practice of leaving it exclusively to governments to develop public policies governing ICTs, arguing for the wider participation of civil society in planning and establishing goals like social empowerment.

Beyond policy-oriented efforts to rationalize and organize information about Internet coverage and its insufficiencies, it is safe to say that in Latin America, save for a few exceptions, the public has little involvement in Internet policy and access remains a critical problem. As Argentinean Professor Del Brutto writes, “the internal public policies of each country are chaotic with respect to the ease with which the public can access the Internet. By chaotic I mean, given the timidity of the State and the expansion of the private sector, the public has little to no intervention” (Del Brutto, 1991). One exception has been Brazil and the publication of its exemplary *Sociedade da Informação no Brasil: Livro Verde (Information Society in Brazil: Green Book)*, a collection of contributions from more than 150 specialists, organized by topic (public administration; business action; cultural content and identity; international cooperation; outreach; education; network infrastructure; regionalization; research and development; planning; and high-performance processing). The report’s practical applications are evident in the sections that organize each of its eight chapters: “what it’s about,” “where we are,” “where we’re going,” and “what to do.” It suggests that the term information society is not just an expression: “It represents a profound shift in the organization of society and the economy; some would consider it a new techno-economic paradigm” (Takahashi, 2000, p. 5).

For the *Livro Verde*, the information society is also a global phenomenon with political, economic, and social dimensions that are not exempt from risk. In the poorest of the developing countries, the choice between groceries and connectivity is not easy. The states have a major duty to provide infrastructure and training to connect their societies to information networks, but also necessary is the coordination of social efforts. "Since the mid-1990s, countries and political blocks have faced the opportunities and risks associated with the future and, acknowledging the strategic importance of the information society, have then taken steps to ensure that this new era will benefit them" (Takahashi, 2000, p. 5). The *Livro Verde* proposed actions like legislative measures (for example, to facilitate electronic commerce), expanding Internet coverage to all Brazilians, promoting digital literacy and creating contents online committed to expanding and reinforcing Brazilian arts and culture, connecting computers in all the public libraries, and increasing digital resources like cellular phones and high-definition television across the country.

In January of 1999, Chile produced a similar document titled *Chile: Hacia la Sociedad de la Información. Informe al Presidente de la República (Chile: Moving Toward the Information Society. Report to the President of the Republic of Chile)* (Comisión Presidencial, 1999). In Central America, the Fundación Acceso (Access Foundation), with the participation of researchers like Kemly Camacho, Juliana Martínez, and Evelyn Zamora, produced useful monographs on the knowledge and diffusion of the Internet, as well as society's appropriation of it.⁶ In the Caribbean, since 1993 the Fundación Funredes (Funredes Foundation) – established in the Dominican Republic and headed by Daniel Pimienta – has done systematic analysis on the social uses of computer networks, as well as a study of the presence of Latin languages on the Internet.

These are just some examples of collaborations between researchers, public institutions, and nongovernmental organizations (NGOs) that have aimed to facilitate social access to the Internet. Now, over a decade into the new century, Latin American scholars interested in these issues have enough experience with the Internet to comprehend and compare costly omissions, excessive hopes, and, when they exist, successful policies on the development of the digital communications in this region. Unlike most academic studies about the traditional media that were distant from the public policies in that area – particularly between the 1960s and 1980s – research regarding the Internet and other digital resources has been more involved with public deliberation about these matters – even the critical positions. Most of the scholarly research has been as critical of the indulgent perspective as it has of the apocalyptic approach.

Complicating Internet Access Issues in Latin America

With healthy skepticism, Hopenhayn (2003), established in Chile, warns us not to confuse limited, if successful, Internet access programs with the lack of prospects that continue to define the Internet in Latin American countries:

While it is true that there are exemplary cases of poor high-school students that manage to dialogue from terminals at school with peers across the world, comparing graffiti or biology experiments, we must recognize that in Latin America we have beautiful and heroic singular cases, but very inadequate public policies in this area. (p. 301)

The diversity of experiences and cadences with which the Internet has developed in Latin America has made it difficult to produce panoramic studies. Three German researchers – Herzog, Hoffman, and Schultz (2002) from the Instituto de Estudios Iberoamericanos (Institute of Iberian Studies, IEI) in Hamburg – made a laudable effort to make several of the first comparative reviews about these issues. In contrast to the availability of statistical information in European countries, Canada, and the United States, there have been persistent difficulties in obtaining hard data about media access and use, including the Internet, in most of the Latin American nations. Nowadays, in spite of the difficulties, we have seen a growth in statistical sources about media use in Latin American countries (international reports, national censuses, marketing research, quantitative case studies, and so on), creating a corpus of data and knowledge.

Contributions like these provide context for the study of more particular issues, such as how citizens use the Internet; the role the Internet plays in the creation, propagation, or dissemination of social and national identities; and the ways in which some social movements have taken advantage of the web. Various methodological frameworks have been employed to understand different ways of using the Internet. In addition to traditional quantitative methods from sociology, ethnographic and other approaches have been adapted from anthropology and other disciplines.⁷ Notably, Rafael Capurro (2000), a Uruguayan professor of computer science in Stuttgart, has emphasized the need for studies that examine the local, cultural dimensions of Internet use:

This refers to the way in which local cultures – for example, cities, regions, and countries, but also individuals, businesses, and groups – present themselves on the Internet, highlighting their cultural particularities through things like language, colors, symbols, etc. This type of study should show not only different types of cultural mixing, but also the openness and intercultural porousness, as well as the persistence of prejudices, preferences, and interests. This type of study could also show in what way political and cultural conflicts are reflected on the Internet and what type of problems are generated by this space which covers, so to speak, the framework of geographical, cultural, and legal limits, whose boundaries have determined human history since its inception. This is an issue that includes but also goes far beyond the question of whether or not a specifically Latin American way of using the Internet exists.

With the notion of “Internet for all” as a point of departure, various authors have examined experiments in communal uses. On the one hand, they find that social groups and movements employ the Internet to interact with each other, in addition to building a public, sometimes even global, presence that they would not have achieved under other conditions. The imbrication of the Internet with a large variety

of social movements – often with opposing ideological leanings – has confirmed the political neutrality of the Internet as well as its capacity to help promote almost any cause. León, Burch, and Tamayo (2001) studied the Internet's ability to be used as an instrument as well as a space for the expression and development of social movements. The Mexican researcher Galindo Cáceres (1997, 2001, 2006) examined the Zapatista Army's use of the Internet, inspiring various other works on this topic (like those of the Spaniards Sierra [1997] and Vázquez Liñán [2004] and the Mexican Rovira [2009]), which seemed to confirm the Internet's radical potential to empower and give voice to even the most marginal social movements.

Another important line of study in the collective use of resources to access and express oneself on the Internet has focused on public access sites, some free and some that charge a fee, which have proliferated in Latin American countries. The financial and sometimes technical difficulties in connecting every home, or the desire for occasional privacy, particularly in the case of young people, have aided the rapid spread of computer centers and Internet cafés throughout the region. Over the past 10 years, studies have focused on the specific uses that benefit or facilitate these Internet access sites, the public policies that replace or complement them, and the users' experiences.

A number of these studies are worthy of note, providing an overall picture of the complicated issues of access that have defined Internet use across Latin America, as a host of actors from local communities to national governments have worked to bring connectivity to the region, with uneven results. Hernández Tapia (2004) compared the Digital Communication Centers created by the Mexican government around 2003 with family-run Internet cafés with better performance and coverage; in both cases, there were opportunities for users to improve their digital skills. Finquelievich and Prince (2007) studied Internet cafés in Argentina and verified the convenience of those places as a replacement for the hardware and connectivity that many people do not have in their homes. Colona (2003) discovered that the users of public Internet booths in Lima give greater credibility to the contents they find on the web than to accredited references. Fuentes Zurita, Yurén, and Elizondo (2008) did a detailed study of the use of Internet cafés in Mexico City and observed how the young people built their identities around the moments that they stayed in those places. Ways of communicating among themselves, and the peculiar expressions and iconic symbols that they use, are cultivated in the Internet café. Gonzalo Vega (2005) examined the Venezuelan government's plan to set up computer centers (*infocentros*) and found that, while the program made the social inclusion of its users easier, it did not stimulate their technological literacy. In the search for a desirable public policy in this area, Robinson (2007) had severe criticism for "e-Mexico," the governmental program for Internet expansion, and proposed the creation of community centers with digital technology access (*centros comunitarios digitales*). What has seemed to emerge from these studies is an emphasis on the importance of the private enterprises (usually small parlors) that complement state action in the expansion of connectivity in Latin American countries.

Youth Cybercultures, Citizenship, and Urban Environments

Constant connection to digital devices influences almost all orders of contemporary life, but in Latin America there has been particular interest in understanding how digital media are both transforming and responding to changes in youth culture, citizenship, and urban environments. Latin American approaches to this new world have moved from a general initial look, often inflected with astonishment, to more astute observations made after over a decade of experience and research. With its integrated highways, avenues, and paths, the Internet itself has a reticular structure that can be compared to a major city. Its arteries run parallel or across each other, following the linked hypertexts that connect them. The same happens with Internet users. One can traverse the Internet with others, in search of others, or alone. This points to a deep ambivalence, common among commentators in Latin America, about the role of digital media in changing forms of youth culture, citizenship, and urban life. This ambivalence likewise is encapsulated in the words of Argentine researcher Diego Levis (2009), who has studied the effects of computers, televisions, cell phones, and other devices on people's relationships with media content and with one another: "we use technology to give us a better life in a better world. We must not allow the Internet to trap and immobilize us" (p. 278).

The interest in how young people approach and incorporate new technologies has generated very detailed studies with methodologies ranging from testimonials to participant observation, and from statistically representative surveys to in-depth ethnographies. Studies of the use of the Internet for educational purposes appear in a number of primarily technical works. From the pedagogical perspective, there are hundreds of reports and studies about the Internet in schools, as well as a vehicle for distance learning. In several countries, the learning capacities of the web have been harnessed more in private schools and universities than in the public education systems or by the public universities (which are the major educational institutions in Latin America). Among the conceptual reflections in this area, the Chilean Brunner's (2003) essay stands out for its critical focus on the Internet as an educational tool (underlining the errors but also the responsibilities of governments). The use of computers and the Internet in public libraries in Mexico was the subject of an extensive national survey, and then a book, by Santos and De Gortari (2009). The librarians appear in that research as the main enablers of the use of computers and the Internet, in addition to their traditional work as information archivists. However, it is very difficult for them to accomplish the task of enabling computer and Internet adoption because many of them have been trained in an analogical environment (a situation that is of course changing, albeit unevenly). The didactic use of computers by young people has also been the subject of both political and commercial projects. *One Laptop per Child*, for example, which has brought together diverse businesses and digital

technology promoters, has been implemented in Uruguay.⁸ Undoubtedly, it is important that each child have his or her own laptop. But the hardware is insufficient without proper software, appropriate training for students and teachers, and adjustments in the educational system. The Uruguayan case is the first Latin American experience in massive distribution of computers to children and young people, and deserves more attention.

Another vital issue that researchers in Latin America have raised concerns the implications of young people's use of the Internet for digital labor practices, and the blurring line between leisure and work apparent in young people's uses of digital media. In one study, the Mexicans Crovi and Girardo (2001) examined how young people use the Internet, paying particular attention to the question of labor, or how young people learn to do digital work. The ability to use digital technologies is a competitive advantage for young people, they argue, but the way these technologies facilitate "telework" and "piecework" can easily translate into reduced labor rights in their transition to workers in a digital economy. In Peru, Quiroz (2004, 2008) examined the Internet as an aspect of youth media consumption, studying its use in both schools and public settings. He found that computer users felt greater freedom and developed new socialization skills, with more friends online and different ways to construct and express their identities. Of course, it is important to note that young people's use of the Internet in the home, as in schools and public places, has presented new challenges for both teachers and parents. Generational differences can be acute: while for parents the Internet is often associated with knowledge and intelligence, for young people it represents a new space for social life and leisure.

The use of the Internet, including image sharing and other multimedia forms, is now a part of the practices of identity formation for younger generations, at least among those with access. Contributors to Urresti's (2008) edited collection identified the characteristics of a slightly nebulous but engaged youth cyberculture in Argentina, for example. These researchers focused on a range of activities of Argentine youth, including their multitasking abilities, encounters with Messenger and other chat functions (which do not replace face-to-face relations), and the social contexts in which they learn to use computers and the Internet – namely, with their classmates or friends but not with their parents. As the research compiled in Urresti's collection shows, the Internet has become a propitious place for the formation of personal and collective singularities, even "urban tribes."

Young people's use of digital media is deeply tied to the role of digital media in changing conceptions and practices of citizenship in Latin America. The Internet's capacity to create relations among people, groups, and institutions has made it essential to the construction of citizenship, understood as the ability of citizens to exercise their rights in an informed and participatory way. This has been the focus of investigators like Lozada (2004) and Martínez (2004) from Universidad Central de Venezuela and Universidad del Zulia, in Venezuela. The Quito headquarters of the Facultad Latinoamericana de Ciencias Sociales (FLACSO) has also supported various investigations on the use of the Internet in fostering practices of citizenship, as well

as in specific aspects of public management (Cerbino & Richero, 2006), and on the social appropriation of new technologies in Ecuador, Chile, and Peru (Albornoz, Benalcázar, Rodríguez, & Paz, 2006; Albornoz, Cabrera, Palacios, Ramírez, & Villafuerte, 2007). In Brazil, Krohling Peruzzo (2005) has reflected on the contrast between utopias and social rights in efforts to build forms of democratic communication on the Internet.

Argentine professor Susana Finkelievich (Finkelievich, 2000; Finkelievich & Schiavo, 1998) has been particularly dedicated to studying the intersections between the Internet, citizenship, and the urban environment. "We have evolved from networks of citizens into cities, and from there to a world that is not smaller, but inextricably complex, in which local actions have global repercussions and vice versa" (Finkelievich, 2000, p. 18).⁹ The critical and policy-oriented perspectives of the authors that Finkelievich collects in her substantial edited volumes imbricate digital networks with public administration. But instead of e-government – that is, the use of digital resources in government operations and in its relation with the citizens – they are concerned with electronic governability (understood as the political efficiency of the government).¹⁰ In addition to studying the Internet in large metropolises, they present proposals to develop social participation, working from the Internet, in small municipalities. From the perspective of cyberculture studies, André Lemos (2004) has observed that in Brazil "cybercities are now considered as a way to reestablish public space, synergize diverse collective knowledge, and reinforce community ties" (p. 22).

Cyber-Journalism and Blogging

An innovation and a challenge, cyber-journalism has been a recurring subject for researchers in Latin America, like the Mexicans Islas (2002) and Navarro (2002), particularly in light of the interest that it has begun to generate in communication schools. Islas and Gutiérrez (2000) examined how the web serves as host to conventional media. These researchers head the Internet project, *Proyecto Internet*, on the Mexico campus of the Instituto Tecnológico de Monterrey, where they edit the e-magazine *Razón y Palabra*¹¹ and are part of the ALAIC working group on the Internet and the Information Society. Covi Druetta (2004b), and the authors that she gathered, discuss the role of the media in the context of the information society. As contrasted with the traditional media, which are subject to corporate priorities, the Internet has promised to offer the means for a new diversity of expression, although access difficulties have constrained those possibilities only to connected citizens.

As university communications departments started recognizing the explosion of the Internet onto the media landscape, studies developed for teaching purposes, but also in the professional field, examining the implications of the Internet for both

journalism and entertainment. There are dozens of monographs and theses about online journalism, but comparative studies are still scarce. One of the most important studies was carried out by an Argentinean researcher living in Madrid, Luis Albornoz (2007), who did a comparison of the main online Ibero-American daily newspapers. Among other characteristics, he found a strong presence of brief news compared to other kinds of journalism, an abundance of advertising, more text than multimedia pieces, weak participation on the part of readers, and an increasing presence of creative professionals (journalists, photographers, and designers specializing in digital media).

Studies on the unique aspects of the Internet as a space of communication and interaction in comparison with conventional media are also growing. One pioneer in this field is Raisa Urribarri (1999), a professor at the Universidad de Los Andes in Trujillo, Venezuela, who applied Latin American communication theory to speculate on the participatory uses of the Internet. Later studies asked to what degree the Internet is displacing conventional mass media, or even whether attributes like interactivity and the personalization of content are leading to the end of mass media or journalism. This is the very question that contributors take up in Carlón and Scolari (2009): while some authors defend the prevalence of the printed book, others describe the new grammar in television brought about by digitization and the contrast created by online audiovisual formats like YouTube. Rather than conclusive assertions, approaches to new media are providing descriptions and conjectures about the next media landscape.

The rise, ease of use, and content of blogs are also of interest to Latin American Internet researchers, especially in their open-diary nature and the implications for journalism. One of the most comprehensive publications in this area was compiled by the Brazilians Amaral, Recuero, and Portella Montardo (2009). After a brief history of blogs, the authors suggest a method to study blogging that takes into account readers' participation. Appraising several Brazilian blogs, they saw these spaces as new mechanisms of political representation and, in other cases, as a new kind of journalism. In addition, the Federación Latinoamericana de Facultades de Comunicación Social (FELAFACS, 2008) dedicated an issue of its magazine to discussing the global and local dimensions of the blogosphere.

Affect and Collective Intelligence

In Latin America, the Internet has become a medium for new cultural manifestations and a site for the formation of social relationships that do not necessarily exist offline. Latin American scholars have examined these emerging cultural forms and relationships from different perspectives. To Piscitelli's work discussed above we can add the conclusions of another Argentinean, Romano (2000), who sees virtual communities as "new artificial psychological masses" (p. 6). To the degree that digital technologies

are increasingly woven into our daily lives, they are both the forum and the vehicle for the exposition of public issues, as well as for topics and practices that in the past were confined to more private realms of individual consciousness. Internet researchers in Latin America have given some attention to the forms of interconnection between Internet use and the mental and affective lives of its individual users, as well as the new forms of collective consciousness, or “collective intelligence,” that the new medium seems to facilitate.

The fields of psychology and psychoanalysis are logical places for these lines of inquiry. From the camp of psychology, but free of disciplinary fundamentalism, the Uruguayan Balaguer Prestes (2003) took up an examination of the cultural implications of the Internet in the broadest meaning of the term. “The Internet is a new psychosocial space that each cybernaut can live in according to his desires, possibilities, and limitations,” he argues (p. 11). Subsequently, Balaguer Prestes (2005) analyzed subjects like Internet addiction, digital interfaces and young people, psychoanalysis and new technology, and postmodern conceptions of the body. The intertwining of exhibitionism and prudence, the exposing of private affairs that has turned into both a business and a social phenomenon, and the way that diverse expressions of individualities are multiplied on the Internet, are key issues discussed by the Brazilian professor Paula Sibilía (2008) in an intelligent book that incorporates psychoanalysis, literature, and social sciences. To her, intimacy has become spectacle, and that mutation means deep transformations in social relations and forms of subjectivity and self-conception. Affective relations in spaces like chat rooms, and the tensions between eroticism and censure, are discussed without preconceptions by Sánchez (2001). The possibilities of new technologies to open up the senses to unconventional perceptions are studied by Yehya (2001), who also includes an analysis of cyborgs and robots, and Gómez Cruz (2003), who discusses the relationship between cybersex and virtual communities.

The work of André Lemos and Pierre Lévy, independently and together, develops the notion of collective intelligence based on social and political participation through the Internet. For many years, André Lemos, along with Marcos Palacios, headed the Centro Internacional de Estudos e Pesquisa em Cibercultura (Center for the Study and Research of Cyberculture) in the Communications Department at the Universidade Federal de Bahia, in Brazil. Three working groups – on cybercities, online journalism, and Internet and politics – as well as the e-magazine *404n0tF0und*, formed part of this academic collective. Later Lemos, in addition to maintaining an interest in topics related to the Internet city, dedicated himself to studying the cultural, aesthetic, and ethical implications of the Internet as well as cell phones and other digital technology. In 2010, he and Pierre Lévy published a declaration in favor of cyberdemocracy, which they argue could involve a new form of the state headed by collective and reticular intelligence (Lemos & Lévy, 2010).¹²

In the preceding pages I have presented an inventory, structured around a half-dozen topic areas, of Latin American research on the Internet: (1) the groundbreaking work of Alejandro Piscitelli and his Facebook Project; (2) the studies of the

information society and the “digital divide”; (3) public access sites, communal uses, and the more complicated issues of digital access in Latin America; (4) youth cyber-cultures, citizenship, and urban environments; (5) online journalism and blogging; and, finally, (6) affect and collective intelligence. I now turn to a brief reflection on the possible future of Latin American studies of the Internet and digital media.

Analog Researchers, Retrained for the Digital World

Many of us who currently study the Internet have made the switch from the old analog world to the new digital context. Those of us of particular generations have already had years of experience doing academic work in predigital conditions, when the information society exploded into our lives and work. We have been, in Prensky’s (2001) terms, digital migrants in at least three aspects. In just a few years, our daily personal lives have changed with the use of new technology. Additionally, part of the way we organize and carry out our work, and potentially our analytical and research routines, have changed thanks to the computer and the availability of information online. Finally, we have also shifted our topics of study to dedicate ourselves to these new technologies. In addition to thinking about the Internet, we continue to focus on some of our old subjects (conventional media, for example), and we are constantly thinking about the contrast between the vitality, so intense that sometimes it becomes hypnotic, with which new media develop and change, and the traditional media’s more familiar and predictable routines.

The Internet and new media formats and technology interfaces are constantly changing. They are media in a process of evolving. In contrast, conventional media only go through minor modifications, while their format, rhetoric, and the very logic through which they communicate messages remain the same. If we were in Jurassic Park, we could say that the old media (television, print, radio, cinema) are like the lumbering diplodocus, while new media are more like a velociraptor. It is impossible not to pay attention to the former because we are used to them and they are an integral part of our daily perspective. However, we are not only in the presence of a reconfiguration of the old media but also facing new languages, structures, layouts, and contents in the digital environment. The mass media communication schema, based on one transmitter and many receivers, has experienced a radical change with the interactive and production capabilities of the Internet.

New media displace the previous media – and us – from one format to another, from one capacity to another. Following the steps of these new media to try to understand their internal logic and their consequences for society has required media scholars to adapt existing quantitative and qualitative methodologies and computer skills. This task also requires extreme patience, above all when we have to deal with outdated hardware or computer programs that do not always work the way they

should, or when we have difficult or slow connections that turn the information superhighway into a dusty and sinuous country road.

There is not much time before we digital migrants, who in our academic lives have traveled from the analog world to the new context of computer networks, are displaced by younger researchers who since birth have been familiar with computers, modems, software, and, most of all, the possibility to download information on any subject or archive. The future of research will be in the hands of digital natives who do not marvel at the brilliant constellation of content and connections, because they have always lived with it. These researchers will not suffer the difficult and, for some, unending initiation that migrants from the old order had to experience. The technological update is an exigency for all of us but it is easier and more natural for those who have been educated in the digital context. However, it may be that they lack one essential thing that those of us who have experienced this transition still have: the element of surprise, which has allowed us to identify different characteristics of the uses and effects of digital technology.

Many of our investigations have concentrated on identifying new elements in the interactive, reticular, and creative capacities that these digital resources offer, because we naturally contrast them with the old analog resources. One of the threads of investigation on the Internet and new media during the last 15 years has been the contrast between what is now possible and what was no more than a dream before. Academic concerns about the digital divide, questions about where journalism or electronic government are heading, the variety of expressions of cyberculture, or the digital façades that education or socialization are acquiring are always defined in comparison with what existed before in these areas. Younger investigators will not have this perspective, so it may be more difficult for them to gain insights from those comparisons. They will be familiar with the analog world in which they continue to do some work, but it will be displaced by the presence of digital information and links in the most common of tasks, and perhaps seen as a historical curiosity. And the new generations may not have the same ability to be moved (or alarmed) by technological innovations, because, for them, they will be a natural part of the cultural and social environment.

These new researchers will cultivate a field that has been tilled by the first academics interested in these topics. Perhaps by then the study of the Internet and digital media will have acquired enough legitimacy and authority to be considered an essential part of the knowledge work of universities. At the beginning of the second decade of the twenty-first century, in almost all of Latin America the study of this topic has developed through the individual desire and efforts of a few investigators. In our universities there is still not enough interest to compel academic groups to prioritize the research and teaching on the Internet and new technologies.¹³ The majority of those who have written and thought about these topics had to steal hours from class preparation and other activities. Many other colleagues, in addition to meeting their academic responsibilities, have to supplement their university salaries by consulting, offering courses in private institutions, or becoming entrepreneurs by

promoting their own conferences. Surely as they are kept up and extended, studies on the Internet and various characteristics of cyberculture will find a place in the institution that allows them to expand and solidify as an academic discipline.

A researcher's object of investigation often influences his or her methods and routines. Academics' use of computer networks submerges them in an ocean of new communicative practices. Email, digital file sharing, and Internet teleconferences facilitate the frequent interaction with colleagues with whom we would otherwise only have contact at specialized meetings. Chatting, blogs, and wikis bring about the collectivization of knowledge and sometimes result in collaborative research. I am not proposing that all academic knowledge of the Internet and cyberculture be developed collectively. I do not share the sanctification of group work that is now in fashion, as if individual reflection and work should be definitively displaced in favor of group investigation and conclusions. But, however it is done, today research takes place in a world of varied and vast exchange in spaces connected via the Internet. Some authors argue that given "the cybercultural dimension of knowledge," today "we are moving towards another culture of investigation, towards another way of understanding and carrying out investigation, the social-collective construction of knowledge based on new cultures of information and communication" (Galindo Cáceres, 2006, p. 219). It is difficult to say that all the old ways to gain knowledge and especially to produce knowledge (among others, individual research) have been displaced by new and always collaborative routines. But, undoubtedly, the digital environment generates new options – and exigencies – to discuss, exchange, and spread up-to-date academic work.

We are fortunate to be witnessing these changes. But the technologies of the information society have developed so quickly that we have not had enough time or distance to evaluate them. Perhaps now is the time to set a new pace and think more profoundly and extensively about new media, instead of overwhelming ourselves trying to keep up with every new technological invention. We no longer have, nor should we have, the need to constantly innovate, as if we could simultaneously follow every one of the technological changes that multiply in various devices, formats, programs, and experiences. Recalling the demands of flexibility and creativity that fueled the so-called new economy, Gómez Cruz purposefully singles out academic research:

It would appear that the academic studies of technology, especially on the Internet, suffer a similar vertigo, from the constant necessity to discover, explain, or be the first to name or establish an analogy, metaphor, or what have you, for the purpose of being a pioneer or colonizer of the field. This search is more reminiscent of marketing and publicity than of critical thinking and scientific spirit. (Gómez Cruz, 2007, p. 20)

For investigators of the media, the Internet is a topic of study, an instrument of exchange, a crucible of links, an alibi for surfers, and also, among many other things, a scene where cohesion and regional identities are constructed. If we make the effort

to avoid – without ignoring – the temptations of the market and thus privilege critical analysis, we will be able to find greater social utility for our investigations.

Topics in this line of research over the coming years will be increasingly specific and will move from amazement to proposal design and even public demand to understand the effects and results of new digital technology. As one of the conclusions in a collection on communications research agendas needed in Latin America highlights:

The Society of Information has arrived; it is here, and it is a great opportunity. Nevertheless, we are getting stuck on the devices; we are being seduced by the technology; and we are lacking a lot of reflection on and intervention into public policy, in how the story is told, in cultural experience, in business models, and on how to create more communicative citizens; how to be less of an audience and more the producers of media. (Rincón, 2009, p. 167)

This defining of research priorities does not mean we should not recognize the value of technological innovation. But we cannot be overly concerned with new gadgets when, as is the case in the majority of Latin America, there are not even public policies for the development of connectivity, and where broadband is the privilege of exclusive sectors in limited urban areas.

The more that it develops and diversifies, Latin American research on these topics will consolidate its own voices and characteristics. Although it is difficult to think of specific regional trends because, as I noted at the beginning of this chapter, we find ourselves in a field of study that is global by definition, we can take the trends and methodologies that researchers from other areas propose and adapt them to our own needs. To understand the Internet in each region or country it is important to take each site's contexts, uses, and conditions into account. The editors of a 2009 book on studies of the Internet in different regions and countries rightly explain:

When thinking about “the Internet” it is important to remember that we are dealing with a range of different histories and experiences, and that we should not generalize based on “our” use of the Internet to that of other people, even other people in our own communities. It is not really possible to talk about “the Internet” as if it were a single phenomenon or has a simple history. (Goggin & McLelland, 2009, p. 10)

These authors highlight the need to identify paradigms for the study of the Internet beyond investigations in Anglophone countries, and their work provides a panoramic perspective through scores of regions and topics. Nevertheless, their book does not include a chapter on research in Latin America or in the Spanish language, suggesting that the region and its scholars are still underrepresented in the dominant paradigm of Internet research.

Although they do not make up a school with its own theoretical models, Latin American researchers can identify common focuses and preoccupations to define lines and priorities of study in a broader context. The Colombian professor Omar

Rincón (2009) has enumerated some points of affinity between those interested in social communication in Latin America, be they researchers or protagonists.

What brings us together? What do we have most in common? On what do we base public conversation? Without much analysis, we see that we come together through telenovelas (the value of including the popular), soccer (the value of interclass and intergenerational passion), drug cartels (value of organization and loose ethics), pirating (the value of the right to entertainment), bodies (value of sex and labor), music (the value of pleasure), corruption (value of cynicism and irony), the Internet (the value of connection). These are our connective flows, from the pleasurable, to the marginal, to the ironic. Thus, if we want to imagine a nation, in culture and communicative practices, we have to “find inspiration” with the values that have connected us in our daily lives: popular aesthetics, the ethics of fast benefit, the passion for the jersey, entertainment, bodies, pleasure and irony, and Internet communities. (Rincón, 2009, p. 171)

These Latin American qualities undoubtedly influence our approaches to the Internet. After 15 years of research on the web, we have ample knowledge, with descriptions and interpretations like those that have fed this chapter’s bibliography. Now is the moment to take these and many other studies that proliferate in our universities and to analyze them from a perspective that is at once Latin American and global.

It is time to think about the Internet in terms of its contexts and deficiencies, as well as its possibilities for our countries. It is time that we do more than just bear witness to the technologically prodigious, though socially meager, present that digital information technology is creating at this moment. We have to think about the meaning of the changes that these technologies bring about, and not only in the sense of reviewing or taking inventory of the innovations. We need to generate more theory and fewer monographs, even if in the academic market conceptual reflection is not as attractive as enthusiastic description. In addition to witnessing, we have to understand the vast implications of the Internet, and for that we must understand the people who use, enjoy, suffer, and lack access to it.

NOTES

- 1 Piscitelli (1995) explores the world of intelligent machines, nanotechnology, and virtual spaces among other expressions of a new cyberculture; Trejo Delarbre (1996, 2006) seeks for features and problems in the information society and the lack of public policies in this region; Sánchez (1997) illustrates languages, politics, and socialization innovations in the virtual context; Finquelievich and Schiavo (1998) think about the urban spaces reengineered by telematic networks.
- 2 These are theses at all university levels (doctorate, masters, and bachelors) in all of the UNAM departments, be it basic science or engineering or social sciences and the humanities. The numbers per annum are as follows: 1995, 2; 1996, 6; 1997, 22; 1998, 51; 1999, 41; 2000, 66; 2001, 109; 2002, 51; 2003, 73; 2004, 89; 2005, 82; 2006, 168; 2007, 126; 2008,

- 60; 2009, 59. For all 15 years, a total of 1,005 theses focused on the Internet or related subjects. Investigation done with information from TESIUNAM (2010).
- 3 ALAIC (<http://www.alaic.net>) was founded in 1978. Currently, one of its 22 working groups is dedicated to the topic "The Internet, the Information Society, and Cyberculture" ("Internet y Sociedad de la Información y Cibercultura").
 - 4 "Cyberculture" studies should be distinguished from more sociological approaches to studying the Internet. Lemos (2003) provides a useful definition of the term cyberculture, which he understands as "a socio-cultural form that has emerged from the symbiotic relationship between society, culture and new micro-electronic supported technologies that sprung from the convergence of telecommunications and computer science in the 1970s" (p. 11).
 - 5 Social networks like Facebook and Twitter have been studied by other Latin American scholars as well, including those who study media and those who, from a sociological or anthropological perspective, take note of the development of new forms of exchange and socialization. Islas (2007) details the turn that active users, or in mainstream terminology "prosumers," have made from the consumption to production of online content. Yet another approach considers a new stage in Internet development, in which user participation establishes new forms of interaction. That phase, commonly known as "Web 2.0," is examined in Cobo Romaní and Pardo Kuklinski (2007).
 - 6 See the Fundación Acceso website at <http://www.acceso.or.cr/>. In Latin American scholarly and political discussion, the expression "social appropriation" is frequently used to designate a broad variety of teachings, uses, and benefits provided to people by information and communication technologies. "Social appropriation means resolving concrete problems of everyday life with the help of ICTs" (Martínez & Fundación Acceso, 2001). In a broader sense: "The social appropriation of ICTs for development can be demonstrated in a number of ways, such as: by offering better medical information to patients, improving the quality of education through the use of innovative teaching resources; introducing varied, relevant programming into community radio broadcasting; increasing sales of local products in the marketplace; disseminating the results of local research; and coordinating action among diverse groups with common goals" (Gómez & Martínez, 2001).
 - 7 Examples of qualitative approaches to understanding Internet users are collected in Bonilla and Cliché (2001). There we can also find the fundamental analysis of Cabrera Paz (2001), from Colombia, on how students appropriate the Internet. In addition, based on extensive interviews, Winocur (2009) has examined the explosion of digital technologies – the Internet, computers, cellular phones – in the daily lives of young people, stay-at-home moms, migrants, and other sectors of the population. According to Winocur, "those who are lonely are no longer those who don't have anyone around, but those who are disconnected" (p. 157).
 - 8 A study previous to this case can be found in Balaguer Prestes (2009).
 - 9 Finkelievich has also specialized in analyzing the experiences of local development with digital resources (see Finkelievich, 2005).
 - 10 *Governability* is a concept developed in political science. A Latin American expert explains: "we understand by governability a dynamic equilibrium state between the level of societal demands and the capacity of the political system to respond to them in a legitimate and effective way" (Camou, 2000, p. 283).

- 11 The website for *Razón y Palabra* can be found at <http://www.razonypalabra.org.mx/>
- 12 This argument updated a book that Lévy, a French philosopher, had published earlier (Lévy, 2004).
- 13 Some exceptions are André Lemos's team in Bahia and, although it is organized around a single department and is not a research project, Alejandro Piscitelli's work in Buenos Aires.

The Prehistoric Turn?

Networked New Media, Mobility, and the Body

Mark Coté

ABSTRACT

This chapter considers the increasingly important dimensions of location and mobility in networked new media. It examines the relationship between the human and technology by foregrounding the body. In particular, it asks how the mediated materiality of the body interfaces with the immateriality of global information flows in ubiquitous distributed media environments. Three main threads comprise this inquiry, all unfolding under the specter of the increasing precarity of labor amidst the broader temporal and spatial dimensions of the information economy under neoliberal globalization. The first two involve hallmarks of Web 2.0: the conflation of work and play, and the prominence of user-generated content. These are situated in the deeper context of convergence by tracing the conceptual shift from the passive “audience commodity” of broadcasting to the interactive immaterial labor 2.0 of distributed digital networks. The final, interdisciplinary line counterintuitively takes a “prehistoric turn” via paleoanthropology to reevaluate the ubiquitous connectivity of our contemporary condition. Fresh insights from our earliest use of stone tools suggest that the human has always had a mutually constitutive relationship with technology. It also suggests the concepts of syntax and grammar for posing new questions about the sensuousness of technology, and the processual mediated environment of the (non)local body.

Introduction

What if, upon reading these words, you wanted to multitask and engage in related critical research? Given that this chapter examines the relationship between the human and technology via social networking, we could begin exploring some of the future dimensions of ubiquitous computing and mobility. There is a good chance you have a GPS-enabled smartphone – indeed, their global sales surpassed that of PCs in the last quarter of 2010, a trend most analysts see as permanent (Arthur, 2011). If so, you could use it to perform a new kind of cultural work: “checking in” to Facebook Places to let your friends know precisely where you are while reading this. Now that may not be your first choice for innumerable reasons, but were you to do so, you would be helping to forge an important new path in networked connectivity: positioning yourself into the digital information flow with precise markers not only of time but also of place. Such new mediated cultural practices are making location awareness a basic part of mobile connectivity. This trend is also reconfiguring the very structure of the Internet with HTML5, the new standard markup language, which integrates location awareness into the fabric and content of the web.

“Checking in” adds the dimension of mobility to social networking; conceptually, we can locate this “geosocial networking” in a more basic site of tension in mediated cultural practices – the conflation of play and labor. There we could sound the depths with an echo of Marx (1977b, p. 164): there is indeed a “mystical character” afoot because when one “checks in,” a commodity is born from this new socially networked form of labor. This is a particular kind of commodity, an information commodity – data comprising a body’s precise location in time and space. In the realm of cultural performativity and communication, this demarcation of time and space is a form of play. Regardless, it also produces a commodity, data that become the permanent property of Mark Zuckerberg and his cabal of lucky investors and erstwhile partners. Facebook, as a capitalist enterprise, loves this information because in creating new forms of location-based user-generated data, it opens up entirely new opportunities for businesses to market and promote their brands and goods. And while at the time of writing “checking in” is the most prominent form of geosocial networking, such location-based practices will certainly become much more sophisticated and diversified, both culturally and in terms of their marketization, in ways currently unforeseen.

Making location profitable has already been fully anticipated by Facebook via its incredibly robust Terms of Use. This widely ignored but legally binding document further echoes Marx, but less in a *mystical character* and more through the *heavy contractual chains* of socially networked labor:

You hereby grant Facebook an irrevocable, perpetual, non-exclusive, transferable, fully paid, worldwide license (with the right to sublicense) to use, copy, publish, stream, store, retain, publicly perform or display, transmit, scan, reformat, modify, edit, frame, translate, excerpt, adapt, create derivative works, and distribute any User Content.¹

Or, as Mashable.com puts it even more succinctly, “All your stuff is ours, even if you quit [Facebook]” (Schroeder, 2009).

Perhaps many readers, like the author, still generate Facebook content on a regular basis. What bears consideration is precisely this *persistence* of use by an ever-growing number of people – steadily approaching one billion worldwide and still growing – regardless of the widespread knowledge of these heavy contractual chains. What may be most mystical about the nature of such new mediated cultural practices is how little this play is understood as labor, or at least how little that understanding seems to matter to most users. This chapter will try to anticipate the future importance of geosocial networking in two quite distinct but related ways. First, it will explore the immaterial aspects of that work–play, that is, its symbolic and affective production. The concept of immaterial labor, in both its original and 2.0 variants, offers a robust frame for understanding the myriad new mediated cultural practices that animate the Internet, social networks, and, increasingly, mobile platforms. Further, these changing cultural practices will be contextualized across the shift from mass media to networked new media. The accompanying process of convergence will be explicated by tracing the changing nature of cultural work, from the audience – via the political economic model of the audience commodity – to immaterial labor. Second, it examines the dimensions of mobility that underpin geosocial networking, especially their ramifications for the precarity of labor, and relatedly the broader temporal and spatial dimensions of globalization. To do so a kind of *habeas corpus* will be applied to that immaterial dimension – the digitally networked realm in which we work and play. In other words, the body will be returned to where, in fact, it always was – at the core of that immateriality. It is always difficult to gain a critical perspective on contemporary practices in which we are immersed, like geosocial networking. To help, we will make what might be a surprising move by rethinking the body not just in its contemporary condition of networked mobility but via a “prehistoric turn” to the most basic form of technology: the elementary stone tool.

Understanding Convergence: From the Audience Commodity to Immaterial Labor

Before directly examining the cultural work of social networks, it is worth setting the stage for the conflation of cultural work and play by appraising some of the key elements in the broader process of convergence. Perhaps the clearest sign that a definitive shift was underway in the media landscape came in 2004 when Rupert Murdoch, a press baron from the time of paper and ink, made the digital leap when his News Corporation spent more than half a billion dollars to buy the social network site MySpace. This move was seen as bringing his traditional mass media empire of movies, newspapers, and television into a networked future, and as signaling for

capital the still-underway paradigm shift in the relationship between audiences and popular culture.

Elsewhere convergence has been widely examined. For example, Henry Jenkins (2006) has intensely studied the cultural dimensions of convergence, highlighting new forms of agency and new practices among new media audiences. Relatedly, Mark Deuze (2006) has looked at how media, in newly convergent forms, have radically reconfigured the contours of traditional cultural work, particularly among media professionals. Part of the import of convergence, though, is that it has not only changed professional cultural work, it has transformed what was once simply called the audience into cultural workers as well. Thus there is the need to rethink the role of the audience in the general circulation of culture. Audience studies was an important part of cultural studies, which looked for aspects of cultural agency at the point of consumption, in the circuit of *cultural production–distribution–consumption* (Fiske, 1987; Hall, 1980; Morley, 1992; Radway, 1984). Drawing a line from earlier audience studies under the mass media paradigm, Jack Bratich (2005) made important linkages to ways of understanding audience power beyond degrees of symbolic agency. (See also his contribution to this volume.) Of particular interest are the links he makes in the changing understanding of audience power, from the disintegration of the “mass” into individual consumer power to, most relevantly, the more distributed, networked model of what Michael Hardt and Antonio Negri called the “multitude.” The key aspect of this theoretical gesture is the *aporia* it reveals in traditional audience studies: that the composition itself holds an inherent agency and constituent power which exceeded the symbolic and precedes consumption. This is a critical thread for stitching together pertinent elements of convergence: that is, how social networks like Facebook are not just new forms of communication but (a) an increasingly important part of media in general and capital in particular, and (b) a new manifestation of the possibilities of autonomous cooperation and organization.

Foregrounding the changing role of our collective participation in the circulation of culture, we begin to get a sense of just how broad and multilayered is the process of convergence. This process entails not just the increasing importance of networked information technology, like the Internet itself, but the ever more deeply networked relations between the economy, media, culture, language, information, knowledge, and subjectivity. This transformation is not only critical to media industries, it is increasingly inseparable in the reproduction of our contemporary social order. Shortly I will consider how the “audience” has changed via the concept of immaterial labor. In short, what was once thought of as the mere consumption of culture has been transformed, along with concomitant communicative and subjective capacities, into a core and active articulation of capitalist production. Here let us recall what has been stated about the change in cultural work; that is, the conflation of work and play. We can draw out this conflation by following what News Corp. has done instrumentally in its pursuit of surplus value. In other words, we can conceptually trace the shift from the *audience* as discrete, measurable quanta in the chain of production, circulation, and consumption to a dynamic, productive composition of bodies

as aggregates networked in information and communication technologies (ICTs). Perhaps one of the most robust links we can make is via what the trailblazing political economist of communication Dallas Smythe called “the audience commodity.”²

In 1980, at the apotheosis of the mass media model, Smythe wrote in *Dependency Road* (1981), “presently we know very little about this strange commodity, the audience” (p. 263). His basic thesis for the audience commodity was straightforward: “readers and audience members of advertising-supported mass media are a commodity produced and sold to advertisers *because they perform a valuable service for the advertisers*” (p. 8). In contradistinction to dominant audience research in cultural studies, Smythe framed the audience via its market aggregation, as opposed to social categories like class, gender, or race. Ever the political economist, Smythe saw first and foremost an intrinsically functional position for the audience within the circuit of production and consumption. What today we can see as more forward looking was the importance he placed on the “cultural work” of the audience in capitalist reproduction. Smythe’s notion was equally contrarian to the Frankfurt School in that he eschewed examining the role of the audience via ideology. This is because his focus was not on how media and culture serviced the reproduction of the dominant class but on the *productive* role it played, not just in the reproduction of capital but in the extension of market relations into everyday life – one of the hallmarks of social networks as business enterprises.

Nick Dyer-Witheford (1999) was among the first to make the link between Smythe and the tradition of Italian autonomist thought,³ a theoretical crucible perhaps most famously expressed in the works of Hardt and Negri, and the intellectual milieu in which the concept of “immaterial labor” emerged. Indeed, while the concept of immaterial labor appeared prominently in *Empire* (2000), it was earlier developed by Maurizio Lazzarato (1996). In an eponymous article, Lazzarato identifies immaterial labor as manifesting across activities that produce the cultural content of the commodity – that is, “activities involved in defining and fixing cultural and artistic standards, fashions, tastes, consumer norms, and, more strategically, public opinion.”⁴

Immaterial labor brings a depth to our understanding of convergence by mapping shifts in broader work practices amidst post-Fordist globalization. As Lazzarato notes, immaterial labor helps us frame the increasing fusion of “leisure time” and “working time,” making life inseparable from work. This is a key aspect of what Marx (1977a) called “real subsumption” – the diffusion of capitalist logic and the dictates of surplus value through more and more of everyday life. The notion of the audience, then, no longer adequately captures our collective role in the circulation of media and culture. Things have changed considerably since Smythe caused such controversy by merely framing the audience in relation to labor. Even his model of the audience is now inadequate: a market aggregation passively bought and sold with no participation other than the movement of their eyeballs. This was an innovation for understanding mass media but it fails to capture the dynamic new elements of the cultural work performed today by what were once called audiences.

In the convergent environment of social networks, user practices are much more active than the passive role of broadcast audiences. This is not to suggest a resolution to Smythe's political economic critique; indeed, the basic point is to show how mediated play is also work in the service of capitalist reproduction. The task is to more clearly see the qualitative shift in which culture, subjectivity, and capital come together in new networks of ICT. Facebook perhaps best exemplifies this qualitative shift and is not only the most prominent social network, it is also *the* success story in new media with over 800 million users worldwide by 2012. The activities comprising new media platforms like Facebook, be they through their location-based services or simply updating one's profile, are something much different from the work of the audience commodity. Indeed, they are not only exemplary of what is now broadly known as the Web 2.0,⁵ but also paradigmatic of an emergent form of immaterial labor. What is new in social networks and across Web 2.0 is the centrality of user-generated content; thus elsewhere I have proposed immaterial labor 2.0⁶ – a more accelerated and intensified form of what was initially proposed by Lazzarato (1996, 2000, 2001) or within the pages of *Empire*. This concept brings us back to the conflation of play and labor, to how we “work” amidst our myriad interfaces with ICT, and draws out some of the unique qualities therein.

In particular, the concept of immaterial labor 2.0 helps us unpack some of the key dimensions of convergence beyond the technical: (a) a blending of production and consumption; (b) an elision of author and audience, especially in the new virtual ICT networks that increasingly mediate our everyday lives; (c) a merging of once discrete media sectors; and (d) the reworking of our communication and our cultural practices as new forms of labor increasingly integral to capital relations. As such, the 2.0 can be a valuable conceptual addendum for the future of media studies. The original form of immaterial labor can be further unpacked with reference to its three dimensions identified by Hardt and Negri. First, immaterial labor denotes conceptual work, from problem solving to symbolic or analytic tasks. Such jobs are broadly dispersed across the culture industry and beyond. This form of labor is indicative of “the symbolic turn,” the shift in production from the material realm of the factory to the symbolic production of ideas. The second entails the production of affect, forms of labor that manipulate “a feeling of ease, well-being, satisfaction, excitement or passion” (Hardt & Negri, 2004, p. 108). Such labor has largely been unpaid and often regarded as “women's work,” like that which produces services or care through the body. Finally, there is the incorporation of communication technology by industrial production (Hardt & Negri, 2000, p. 293), transforming the very form of labor into increasingly mechanized and computerized modalities.

Immaterial labor 2.0 builds on these dimensions. The first important addition is the notion of “free labor” – in the matrix of work and play – initially popularized by Tiziana Terranova (2004) when she identified it as a central feature of both the Internet and the informationalized economy. Her work, especially the book *Network Culture*, is of prescient value, given that her innovative application of autonomist thought to information theory offered great promise for future research into the new

digitally networked reality of our contemporary condition. The development of Web 2.0 has only elevated the level of participation/work. So on sites such as Facebook, in addition to the corporate mining and selling of user-generated content, users also produce the tastes, preferences, and general cultural content constructed therein. While this strongly resonates with the “labour that creates immaterial products, such as knowledge, information, communication, a relationship, or an emotional response” (Hardt & Negri, 2004, p. 108), it is important to further delineate the subjective composition of this labor. The “subjective” is used here to indicate the degree to which the ongoing construction or performance of our identities is produced online, specifically within social networks. Immaterial labor 2.0 indicates how this subjective turn entails cultural *work*; the active and ongoing production of virtual subjectivities in and across our profiles on social networks. Then there are elements of the originary concept that are extended and intensified: affect, for example, is of critical importance to Facebook, acting as the binding, dynamic force that both animates those subjectivities and provides coherence to the networked relations. Finally, there is also a Foucault 2.0: social networks can be seen as biopolitical networks insofar as they articulate new flows through differential compositions of bodies – populations whose capacities to live are extended through the particularities of their subjective networked relations.

One of the underlying reasons Lazzarato conceptualized immaterial labor was to more clearly frame the aforementioned process of “real subsumption” – that is, how capital is seeking an unmediated form of command, not just over labor in the factory but in everyday life. That is why Lazzarato coins the slogan “become subjects” (Lazzarato, 1996), echoing the “subjective” reading of capital common among autonomists.⁷ To clarify, this denotes the autonomist understanding of the shift in the organizational form of capital, away from the mass production of Fordism toward the more flexible, diffused production of post-Fordism, which relies even more heavily on technology. What is “subjective” is not how the necessary skills, technics, and practices are simply absorbed in machinery – as a trend of deskilling might suggest. Rather, the subjective dimension is evident in the increasing importance of the linguistic, cognitive, and even cultural aspects of work, and their ever-more integral part in the formation of laboring subjectivities. In other words, the subjective reading situates the productive and creative capacity of labor first, thus expressing the possibility of a positive and constructive vision that flows out of labor power – as opposed to it being exclusively a site of exploitation and alienation. This “subjective turn” also highlights a basic orientation of autonomist thought: to look to labor first, before the relations in which it is captured and made productive for capital.

So it is this subjective element which facilitates an expanded capacity for social cooperation that is absolutely essential for more flexible production. These are also defining elements of the mediated and networked cultural work that I have been discussing. But here we cannot directly proceed to the immaterial labor 2.0 animating social networks. That is, as Smythe noted for the audience commodity, and the autonomists do for capital, the relation between play and work, or labor and capital,

is best viewed by first considering the actions of people which are, in turn, captured by capital (more on this in the section discussing “syntax”).

In the context of social networks, then, we should remember their origins not only in the febrile imagination and desires of a Harvard undergraduate, but also in even earlier cultural practices like the peer-to-peer (P2P) file sharing of Napster. Such technics of immaterial labor enabled the proliferation of decentralized practices of virtual social cooperation, in the process radically altering potential kinds of interface with popular culture. This is not to argue for a new form of consumer sovereignty. Indeed, one thing the immaterial labor thesis stresses is the higher level and intensity of antagonism that is created along the way – something borne out in practice with the forced closure of Napster and the subsequent proliferation of new and seemingly uncontrollable forms of P2P practices like BitTorrent. Lazzarato notes this fundamental contradiction in the workplace. Capital “is obliged ([in] a life-and-death necessity for the capitalist) not to ‘redistribute’ the power that the new quality of labor and organization imply” (Lazzarato, 1996).

We can see this playing out in the dynamic decentralized architecture of the Internet – the distributed network in which computers with a shared protocol can communicate directly without a hierarchical intermediary. This is not only a radically different media terrain than television, it is one animated primarily by immaterial labor. In short, we have shifted from the static world of the couch potato to the dynamic one of the blogger or the social network, busily updating, Tweeting, or checking in. Capital has paid attention to this and there is a shift in what is being valorized. With television, the audience commodity was an isolated and sedentary beast, an aggregation of individuals linked only through the show they watched each week. Its organizational form was also more static: a centralized network with the audience in a cluster of dead-end lines. With the Internet – and specifically, online social networks – it is about the dynamic immaterial labor that traverses and constructs the decentralized networks. In short, it is the links, the networks that people construct and participate in that comprise not a new audience commodity but immaterial labor 2.0.

The “Sensuous” Body of Immaterial Labor 2.0

With a clearer understanding of immaterial labor 2.0 in place, we can ask anew about the conflation of work and play by returning to the body. But to what body are we returning? For some, immateriality is resonant with our contemporary condition of ubiquitous mediation precisely because its prefix “im” means “not” as in “not material.” When in its 2.0 variant – that is, when imbricated in digital networks – the “not material” is taken by many as “the virtual.” The overt predominance of mediation in social networks is sometimes interpreted as a kind of sociality that is more technological than human. In due course I will closely consider the relationship between

the human and technology. There are two important paths that I will not follow but are worthy of mention: Haraway's (1991) posthuman cyborg, a deft feminist-philosophical critique which implodes the binary of nature and technology by weaving a hybrid of the former's supposed femininity and the latter's masculinity; and Latour's actor-network theory (1987, 2005), which models assemblages and is concerned not so much about which element is human or technological as about the kinds of agencies each offers in relation to the other. Instead, I will issue a very particular writ of *habeas corpus*, as it were, by returning to a question posed in this chapter's opening. That is, I will first return to the body through the example of "checking in": what mystical characteristic is afoot when the location of one's body is marked in a collective information flow and is turned into a commodity possessed by the owners of Facebook? We should remember that for Marx, commodities are always born of social relations, and this is transparently so in social networks. What is more, what is "social" is also a "sensuous activity" – insofar as the social, by definition, implies relations between bodies – and that is what gets abstracted into commodity form. The crux of a political economic critique is precisely around the *under*-valorization of sensuous activity, that is, of labor; hence the never-ending struggle of labor around the value of work. Given the astronomical market value of Facebook, it seems reasonable to ask similar such questions about the value of immaterial labor 2.0 which animates not only that social network, but also an increasingly broad swathe of our information economy. The iron-clad nature of Facebook's Terms of Use makes clear that there is a considerable degree of under-valorization of this new mediated form of cultural work. But I will not proceed here by following the established terrain of the political economy of communication. Instead, I want to ask more basic questions about the status of the body (and thus the human) in order to provide insight into (a) the persistence of play in light of its revelation as work; and (b) the very coherence and perseverance of those networks.

Now it is paradigmatic that immaterial labor 2.0 transpires in network relations; it involves the body in relation to a machine, albeit an advanced one. What can we glean by returning to "Fragments on Machines," a section of the *Grundrisse* that has already been noted as a text integral to the very concept of immaterial labor? Of course, Marx wrote during the Industrial Revolution, and his points of reference were machines which the nineteenth-century poet William Blake had earlier called the "dark Satanic Mills." Therein, Marx saw the commodification of worker labor as follows: "What was the living worker's activity becomes the activity of the machine. Thus the appropriation of labour by capital confronts the worker in a coarsely sensuous form" (Marx, 1973, p. 704). Again we find the body – in a machinic assemblage – and again a reference to the sensuous as it relates to labor and capital, and which here we might read in light of work and play. What I am presenting as most important, however, is the passage that follows:

Capital absorbs labour into itself as though its body were by love possessed. (Marx, 1973, p. 704)⁸

This is a passage that bears closer reading. I have already brought sustained focus to “labor absorbed,” in its immaterial and 2.0 forms, and through changes in the modification of these different kinds of cultural work, be it in traditional mass media or amidst the convergence of networked new media. I have also signaled the current and future importance of the absorption of that labor in its *mobility*, as capital in its continued globalization seeks to frame new parameters of space and time. But how might we speak of what is *experienced* – of “love possessed”? To interrogate the body in terms of its sensuousness is to consider its movement, and its affective and communicative capacity; that is, asking what that body can do in relation to the machine that purportedly possesses it.

We can begin by examining the sensuousness of the body within the new spatial and temporal parameters of online social networks. Within social networks, as with all mediated aspects of our everyday lives, our corporeal form, that is, our fleshy bodies, remain as steadfastly bound to precise points on the earth’s mantle as ever. However, in and across those global, distributed networks, we are dispersed, here, there, almost anywhere, virtually instantaneously. So on the one hand, our material bodies remain stubbornly subjected to the Newtonian physics governing large objects; on the other hand, our immaterial qualities (our communicative, affective, and, indeed, cognitive capacities) seemingly possess the “strange action” of quantum particles, with near-instantaneous mobility. Might the related sensuous experience be more clearly modeled in the (*non*)local body?

To clarify, (*non*)locality is a term taken from quantum physics describing how two related particles, although separated by vast distances, seemingly act upon each other instantaneously. Related quantum entities, then, seemingly act as if they are local even when they are not. I am suggesting this as a useful model for understanding the condition of digitally networked bodies. Our material body retains its Newtonian physicality at the local level; yet our immaterial dimension (i.e., our communicative, affective, and cognitive capacities) function near-instantaneously at a global scale. (*Non*)locality, then, is a trope for grasping the constitutive relations of our im/material condition. To add one last “spin,” this conceptual turn of (*non*)locality foregrounds not the spatial and temporal dimensions of labor but, rather, of its very precondition.

This more measured approach to the body leads us to more insights about its animating tensions of play and work. If we begin with the conditions of the laboring body, we miss the nature of its possession. An autonomist reading, just as with the subjective turn, means the body comes first. Then capital, and the machines it mobilizes, absorbs but only through its own particular grammar; that is, a practical and instrumentalized rhythm *imposed* on the laboring body. The body, however, is *already* possessed – literally as sensuous embodied technology. In short, under proposal is a different model of the body: one wherein the sensuousness of its relation to technology possesses a *syntax*, a syntax that is then proscribed and prescribed by the grammar of capital.⁹

A note of clarification is necessary here. The use of the terms syntax and grammar was inspired from two traditions central to this chapter. First, my use of the term

grammar comes from Paolo Virno's *Grammar of the Multitude*. In it, this central autonomist thinker revives the Spinozist notion of the multitude over the Hobbesian people as a political category for rethinking globalization. Virno situates the conflation of work and play in a larger one of labor, politics, and intellect. In this new space, wherein all is political yet seemingly depoliticized and all is performative, he lays out a strategy of "social cooperation" (of which I would suggest social networks are a prominent part). His "grammar" is what allows shared communication among the multitude, which is not a mass body but one of distributed singularities. Indeed, it is in the grammar of cooperation, in "the linguistic-relational aspect" of labor, that Virno situates an already-existing foundation of what he sees as the "communism of capitalism" (2004, pp. 107, 110). Syntax is taken from the late French paleoanthropologist André Leroi-Gourhan. He uses it to better understand the relationship between the human and technology. Thus he writes of an operational syntax, the sequential organization of the interaction between the human and tools. In short, it denotes our constitutive interactions with technology, including that which eventually takes form as immaterial labor 2.0. The analytic value in syntax over grammar is that the sequential organization of the former predates the latter. Again, in autonomist terms, syntax comes first.

So I deploy the terms grammar and syntax to deepen our understanding of what is meant by embodied technology. A sensuous syntax describes the sequence of bodily interaction between the human and technology which is both individual and collective – for example, all the innovative usages of ICTs that allow for our unprecedented capacity for communication. Contrary to Virno, however, this would be a syntax of the multitude and a grammar of capital. One of myriad possible examples would be the development of file sharing, which began with a high school student. This new syntax contravened the grammar of capital, which has ever since sought to proscribe its usage vis-à-vis cultural commodities over which it has intellectual property (IP) rights. To conclude, the syntax of the (non)local body, then, is one of the distributed digital network, both corporeal and communicative, with an ability to act which is both proximate and at a distance. The grammar of the (non)local body proscribes and prescribes forms of immaterial labor 2.0 which, driven by a logic of maximizing efficiencies and profitability, create general conditions of precarity for labor.

The Prehistoric Turn

Earlier I noted that this chapter would make a counterintuitive proposal: that by taking "the prehistoric turn" we can gain important insights about our current technological condition of digital, networked, mobile connectivity.¹⁰ In that spirit, let's again engage in critical research by multitasking. Imagine if you reached into your pocket, but this time, instead of pulling out your smartphone, in your hand was the

most rudimentary stone tool. Would it be possible to “check in,” obviously not to Facebook Places, but to the actual environment in which you are situated? What, if anything, could you learn about our contemporary condition from this simplest form of technology: a rock which has been struck two or three times by another rock, chipping away flakes to give it a cutting edge?

The “prehistoric turn” is meant, in part, as a corrective to a regrettable aspect of the “postmodern turn” so celebrated in the 1990s. Namely, I refer to the prominence then given to the “virtual” and related notions that emerging in these new assemblages of human and technology was a fundamentally new “posthuman” or cyborg (*pace* Haraway). It is regrettable because the undue focus on digital technology obscured a more basic point: that we have always had a constitutive relationship with technology; indeed, that *we have never been human* outside this constitutive relation with technology. It is important to ward off notions of technological determinism when discussing the human in these various machinic assemblages. There is neither primacy nor determining causality ascribed to technology. To the contrary, the human is understood as being in constitutive relations with technology. French philosopher Gilbert Simondon (1992) offers a valuable concept for understanding this mutually constitutive process: transduction. It offers a more holistic frame for understanding heterogeneous formations, wherein primacy is placed on the *relations themselves* over the *things related*. Those things related include the human and technology, the material and immaterial, and indeed, time and space. I find it most useful because it can differentially model the body in various assemblages and thus focus attention on what are complex and recursive relations. So while the human and technology are indeed and obviously different things, I am thinking of them not as discrete entities but as being transductively related.

Perhaps the most apposite guide on this prehistoric turn is the aforementioned Leroi-Gourhan. While little known across media and communication studies, Leroi-Gourhan had a defining impact on the contemporary media theorist Bernard Stiegler (1998, 2009). It is hard to factor the vicissitudes that have left Leroi-Gourhan such a relatively obscure scholar. In the 1930s, he studied ethnology under Marcel Mauss, undertook widespread structuralist analysis of Paleolithic art, subsequently embarking on his decades-long study of prehistorical technics, and eventually rising to hold the Chair in Prehistory at the Collège de France from 1968 to 1982, almost exactly coterminous with Foucault’s Chair in the History of Systems of Thought. Leroi-Gourhan had an avowedly catholic approach to scholarship, with his multidisciplinary ranging across paleontology, physiology, ethnology, the history of art, technology, and biology. Claude Lévi-Strauss wrote about him, upon his death in 1986:

When one rereads his writings on physical anthropology, technology, prehistoric archaeology and art, one sees that the key idea that governed his thinking was always to study *the interrelations between things rather than the things themselves*, to try to reduce the chaotic diversity of the empirical data to invariant relations and to use [...] a method of transformations. (Quoted in Audouze, 2002, p. 282)

His earlier works were profoundly influential in French anthropology on the study of prehistoric technics;¹¹ his innovation was to focus on the technical modes of action on matter. Whereas technology entails artifacts, technics goes further to include related practices, be they arts or crafts and the assemblages in which they unfold. For the ancient Greeks, *techne* was the knowledge of how to generate something, or, in Jean Luc Nancy's felicitous phrase: "techne is the know-how to obtain from nature what it does not offer of itself" (Barison & Ross, 2004). And to bring it to an even finer point vis-à-vis immaterial labor 2.0 or, indeed, any mode of work, consider this from Stiegler:

Technics (*tekhne*) designates, however, first and foremost all the domains of skill [. . .] [ones which entail] production, a transformation of material, of "raw materials," into "secondary matter" or products. (1998, p. 93)

One of Leroi-Gourhan's many innovations was how he framed the technical modes of action on matter in three dimensions: the *interior* milieu of the intellectual capital of the tool-making hominids (one might be tempted to refer here to the autonomist concept "general intellect"¹²); the *technical* milieu (socioeconomic and cultural factors inscribed into the tool); and finally, the *external* milieu (the environment actualized by the tool). What is most pertinent is the notion of technical exteriorization, and it is here that at least metaphorical links can be made to the contemporary practice of "checking in." To begin to make this connection, think of how in this process the assemblage of the human and technology reconfigures the environment in which the human lives, hence demarcating a particular experiential point in space and time.

To make this conceptual leap, the model of the "natural" human must be abandoned. As such, we must proceed via an even more basic transductive relation. The human, for Leroi-Gourhan, only emerges amidst complex and recursive relations *with technics*, beginning with the most rudimentary form of lithic industry (literally, stone tools composed by a handful of blows). There are two key points to draw from the ascent of the techno-human. The first is that technology acts as a vector of exteriorization of the human *qua* the human, that is, technics always entails externalizing traces of memory. So, in the most basic terms, even a stone tool bears the trace of its construction, which can subsequently be "read" by an unrelated hominid. In the words of Leroi-Gourhan (1994), this exteriorization denotes "our unique ability to transfer our memory to a social organism outside ourselves" (p. 236). Please keep in mind this transfer of memory – which, after all, means *traces of our actions* – when thinking about distributed networks and the new forms of "social organization" they enable. Thus the importance of Leroi-Gourhan's second paradigmatic feature: the *relationship between movement, technics, and rhythms*. One of Leroi-Gourhan's most enduring maxims is that "it all began with the feet" (p. 65). What he meant was that when early hominids began walking on two feet, that physical gesture set off a complex cascade of unintended effects. Indeed, his most famous work, *Gesture and Speech*, traces a direct line from this radical innovation in *movement* to the later

transductive development of technology and the human. Amidst this trajectory, the tool and brain are situated in a complex and recursive relation, what François Audouze (2002) identifies as milieus of “mobility, liberation, and exteriorization” (p. 289).

Leroi-Gourhan’s research led him to posit an extra-biological role for technics in the process of the evolution of the human, but a deeply recursive and not determining one. To clarify, early hominids descended from trees, likely because of radical climactic changes, and developed bipedal capacity; this, in turn, impacts upon the position the skull is placed on the spine (because eyes need to look ahead and not at the ground); this is followed by a morphological shift in the cranium for balance (the base of the skull shortens but increases upwards our brain pan and its capacity); and finally, hands are freed from the task of locomotion, and jaws from carrying things; the whole while newly freed hands become more dexterous, enabling them to eventually manipulate and shape the most rudimentary stone tools.

But it is technics, as provocatively suggested by Leroi-Gourhan, which recursively facilitates the actual enlargement of the brain. In other words, Leroi-Gourhan situates tools and the brain in a deeply complex and recursive relation, wherein both impact the other but *only ever in the milieus of mobility, liberation, and exteriorization*.

This has been necessarily a concise overview of the more comprehensive account offered by Leroi-Gourhan and discussed and debated elsewhere (Audouze, 2002; Gamble, 2010; Ingold, 1999; Lemonnier, 1993).¹³ But there are two further details most relevant to media and communication studies. They consist of (a) the relation between tools, cerebral development, and thought; and (b) the syntax governing the rhythms and movement of the human in machinic assemblages.

For the first point, consider that the most rudimentary stone tools (Oldowan industry, which began about 2.6 million years ago) consisted of little more than a few blows to create a cutting edge, and they remained virtually unchanged in the archaeological record for a million years. This caused Leroi-Gourhan (1994) to remark, “among our hominid ancestors, early tool use was an extension of the hand – like an animal’s claw [. . .] as if their brains and bodies had gradually exuded them” (p. 106).

So it is not so straightforward that our hominid ancestors woke up one day just so much smarter and began making tools. Instead, it was an extended and deeply recursive relationship between tool use and the brain that subsequently facilitated cerebral development. But even when more sophisticated tools appeared about 1.6 million years ago, cerebral capacity had barely increased. Stiegler (1998) wonderfully evokes this process:

[W]hat mirage of the cortex is experienced, as pathbreaking, in the hardness of the flint; what plasticity of gray matter corresponds to the flake of mineral matter; what proto-stage of the mirror is thus installed. (p. 135)

This process is called corticalization, wherein conscious interiority develops in relation to nonhuman exteriority. To put it another way, think back to the “natural”

human privileged by the ancient Greeks and the deprecation of material technology. This was predicated on the notion that “true knowledge” emanates only from the interior, from the transcendent soul, while technology was a source of contamination. Indeed, consider what Plato (1952) wrote in *Phaedrus* at a time when the then new information technology of writing was developing:

If men learn writing, it will implant forgetfulness in their souls; they will cease to exercise memory because they rely on that which is written, calling things to remembrance no longer from within themselves, but by means of external marks. What you have discovered is not a recipe for memory but for reminder. (p. 157)

Yet what Leroi-Gourhan's work suggests, and what is most germane to media and communication studies, is that technology, and indeed all forms of mediation, were always a part of thought. As our ancestors used stone tools, not only did they transform their environment in terms of how they could utilize it in a quotidian manner, they literally exteriorized and archived knowledge. For the first time, and unique among all species, there were external traces of memory, and the information archived in tools outlived their makers. And over time this information accumulated, grew more complex because of the increased storage across different tools, and diffused over time and space. It is tools, then, as external repositories of memory and as extensions of the human body that play out in this deeply recursive fashion and influence the development of advanced brain functions like memory, perception, thought, language, and consciousness. Here, a critical insight of the prehistoric turn comes into focus. On the surface, we live in a time when technological mediation is more obvious than ever. While there is much that is wholly unique and new to our condition, it does not include a relation to technology that is for the first time ubiquitous. Indeed, we only became human *qua* the human with technical exteriorization. So, unlike the work of some futurists like Kurzweil (2005), I am not setting the stage for flights of fantasy of our being on the evolutionary cusp of becoming new species, technological hybrids in a new point of singularization. Instead, from the perspective provided above, if we look back millions of years we see nothing *but* prehistoric cyborgs, insofar as we could never have developed biologically or culturally outside that transductive relation with tools.

It is here we can turn to the second germane point, what Leroi-Gourhan called the *chaîne opératoire* (or operating sequence). The *chaîne opératoire* recognizes that the human interacts with the material world via a sequence of technical events. It is not only what makes the transductive human functional, but it sets the preconditions for exteriorization. It is instructive to recall Marx here, and momentarily bracket off that “capital absorbs labour into itself [via machinery]” and think again how it is “as though its body were by love possessed.” As such, let us think about the sensuousness of syntax.

Just as all native speakers know syntax without formal study or even comprehensive understanding, so it is the case with our syntactic relationship to technics. As

Leroi-Gourhan (1994) notes, “operational syntax is generated by memory and is born from [an extra-discursive] dialogue between the brain and the material realm” (p. 114). Syntax is in the order of movement, and all interaction with technology comprises a *veritable syntax of gestures*. Imagine for a moment the hand and a simple stone tool; the external traces, the archival information contained in that tool, provide a functional architecture for technics, enabling a practice that heretofore could not be done (at least in that particular manner). But there is something just as important that is too often overlooked. Beyond its functionality, it is also a vector of exteriorization for calibrating the human sensorium.¹⁴ What a syntax of technics sets are conditions of possibility for a body’s rhythm and movement, at least in that assemblage. So let us return to the example of the simple stone. This entails affective capacities; that is, both contained within the form of the tool and, in conjunction with the hand moving outward from the body, there is a logic of the sequencing of acts that extends and differentiates its ability to act, and thus to feel/experience the environment. So beyond functionalism, syntax offers a provisional answer to the Spinozist question of what a body can do; it creates preconditions for a body to act and to be newly structurally coupled with its environment.

The *sensuousness of technology*, then, is primarily of an affective order, and something already in place when capital attempts to take possession. This sensuousness is also a dimension critical to a body’s mobility and ability to communicate through space and time. Syntax, thus, acts like a time signature and sets the key. Again from Leroi-Gourhan: “Rhythms are the creators of space and time, at least for the individual. Space and time do not enter lived experience until they are materialized within a rhythmic frame” (p. 309). The body is constantly exteriorized via rhythmic frames; hence the importance of syntax. And capital seeks to impose a grammar on those rhythms. The syntax of the (non)local body entails a sequence of communicative and cognitive technics and actions which offer unprecedented flexibility and scope. But the sensuous syntax of the (non)local body that affords flexibility is being subjected to a grammar of capital, making it precarious. Global labor is being subjected to new proscriptions and prescriptions, disrupting the more stable rhythms of Fordism, rendering those out of time. There are many names for this new time signature: post-Fordism, globalization, neoliberal capitalism, the information society, postcolonial capitalism. This rupture takes us from our prehistoric turn back to the future of mobility and precarity.

New Rhythms of (Non)Locality

The operational sequence guiding the movement of labor has changed significantly, in part due to the development of the global positioning system (GPS) that is integral to “checking in” and all forms of geosocial networking. Surprisingly, GPS was not widely deployed until Desert Storm in 1991. Subsequently, it was aggressively

adopted by capital in order to more finely calibrate the “just-in-time” capacities of flexible accumulation. It had an immediate impact on mobility and labor, as this one exemplar illustrates. In 1994, Cemex was a modest, regional Mexican cement company when it synchronized its operations using GPS (Katel, 1997). Before the turn of the millennium, it was buying out leading cement and construction companies the world over, no doubt partially due to its deft deployment of GPS. By outfitting all cement trucks with transmitters, its head office could use real-time data about the location, direction, and speed of every vehicle, and make on-the-fly decisions to radically augment the efficiency of its delivery process. Within a few years of adopting GPS it had become the largest cement company in North America and subsequently the world. However, no sooner had it reached the top than it plunged into near insolvency and remains mired in bad debt. What is instructive here are the changing ways in which location awareness is being used. For Cemex, it was utilized to trace the mobility of raw materials with labor being a mere but necessary minder (i.e., driving the truck). GPS, then, in its “just-in-time” guise, monitors the movement of labor only insofar as it is materially tied to the movement of resources, and it has become standard in virtually all resource-delivery systems. Surplus value comes only through the more efficient movement of resources through space and time vis-à-vis a fixed site of production, be it cement delivery to a building site or parts for a factory.

The great leap forward for capital comes when it contrives to harness the (non) local flow of labor emanating from the newly augmented affective and communicative capacity of immaterial labor in its original and 2.0 variants. GPS is being redeployed by location-based applications to make this (non)local flow itself a site of production, altering the operational sequence of networked assemblages, adding a finer bearing of location to its syntax. At the time of writing, location-aware applications and geosocial networks were proliferating across the mediated landscape. As mentioned, HTML5 will enable location-aware browsing, Google has rolled out its “Near Me Now” search option, and its Chromebook (a laptop that comes without desktop applications or programs) is wholly Internet-based via cloud computing, designed for permanent WiFi connectivity. Chromebook is meant to be the exemplary artifact of Web 3.0 – location awareness plus cloud computing, making platforms and the associated information flow even more (non)local. As well, UrbanSpoon, Yelp, and other related applications are like location-aware Yellow Pages featuring user-generated reviews of stores, restaurants, and bars. There are also location-aware social networks, which allow users to interact relative to where they are. Facebook Places, Google Buzz, Foursquare, and PocketLife are among the more prominent apps. With Foursquare, users “check in” to venues to earn points, and even become “Mayor” of the site. Restaurants and bars are increasingly tying into Foursquare to offer time-specific discounts, and Zagat is overlaying its review database for even more widespread marketing and commercial tie-ins. Again, it is the early days for location awareness, and more sophisticated applications and, more importantly, unexpected new cultural practices are surely in the offing.

So we have immaterial labor 2.0, inflected with location, and manifesting in new cultural practices as well as in the more formal parameters of work. In critically engaging the increasingly precarious parameters of work, Brett Neilson and Ned Rossiter (2005) ask, “what are the circumstances in which capital meets life?” *Always via technics* is the response suggested here. But equally, life meets life via technics; that is, the human is exteriorized into material life via technics, a process that sets the rhythm for the spatial and temporal frame we experience. This process of exteriorization fully exceeds labor’s absorption by capital; it is, resounding Marx in the First Thesis of Feuerbach, “human sensuous activity, practice” (1977b, p. 156). Technics, then, are the proper domain of the human, not an alien, alienating force, although such effects are manifest when directed by capital. Increasingly, our practices are (non)local, simultaneously local and at a distance. One benefit of thinking in terms of the (non)local body is that it foregrounds the embodiment of technology – and thus the transductive materiality of immaterial labor 2.0 – and refuses the problematic typology of the real and the virtual. There is no “natural” presence to the body; no objective parameters of space and time. As such, to think in terms of the “virtualization” of space and time is to miss the whole point of the transductive human. The affective and communicative capacities of the (non)local body may be unprecedented in their scope and speed but no less real – especially no less a real “human sensuous activity.” To be sure, (non)locality is altering our perception of and movement through space and time, via new visceral rhythms, affective behaviors, and integration in space.

Geosocial networking is an emergent techno-social space set by a *new syntax of (non)locality*. In the simplest terms, it is reconfiguring our movement through time and space because we can negotiate it through new, potentially deep and rich information flows. The information produced in geosocial networks helps us find things nearby and tell others where we are – just for starters – and we do that through collective practices – crowdsourcing to some, the general intellect to others, play and work regardless. As one digital media observer puts it, “it will become natural and expected to be informed, personally, about proximate things of interest” (Abell, 2010). From this prosaic insight, we can draw a key dynamic of (non)locality: *proximate affinities*. But what is new, syntactically, is that proximate affinities, just like those subatomic particles, break the principle of locality. We *act corporeally* on proximate affinities on the level of increasing microlocality (i.e., “checking in” to a geographic place), but via a communicative and affective capacity for which *all and everything is proximate* (information flowing near-instantaneously through the network around the world). Socially, informationally, it is not so much another round of time-space compression but implosion, given the radically different registers under which our material and immaterial dimensions operate. For some this marks a too-disorienting dislocation between the body and what they might see as the virtual. But for others, and especially for youth, they are *first becoming (non)local and from there learning to immaterial labor*. In other words: flexibility followed by precarity; that is, they are

sharing a new syntax of time and space which is eminently flexible for myriad forms of new mediated cultural play and just as many kinds of precarious work.

(Non)locality, then, is a preeminent contemporary condition, emergent and unevenly distributed to be sure, but fervently growing. Flexibility is the valorized counterpart to precarity. Indeed, the former becomes the latter when seized by capital. But the absorption of (non)locality by capital comes only by drawing on a sensuous exteriorization that is already in formation. Here I would like to make one final autonomist inflection.

I have been using the term *syntax* to highlight the *temporal and spatial order of the operational sequence* informing the transductive and constitutive relations of the human and technology. I also thought it dubious to use the term *syntax* for capital as a synonym for logic. In part, this is because syntax establishes the preconditions for what a body can do in a technical assemblage and thus is inherently ambivalent. Capital, on the other hand, is wholly prescriptive. It is imposed on a syntax insofar as it determines the propriety or impropriety of syntax. As for (non)locality, that is a truly ambivalent syntax as it is manifested in both flexibility and precarity. So in flexible new mediated cultural practices, proximate affinities and their globally networked diffusions are being acted upon “from below,” as it were, by and amongst everyday people. Yet this expanded communicative and affective capacity is equally being seized by capital in the hopes that it is the pilot wave for the next big thing.

I do not wish to suggest that “grammar” is either inherently negative or the sole possession of capital. It is, rather, a constituting force that formalizes usage or a sequence of actions. As such, we can propose that there are competing grammars with very different proscriptions and prescriptions. One would be via contemporary capitalism. For one possible other, might (non)locality be the syntax governing the temporal and spatial rhythms of what Paolo Virno calls the grammar of the multitude? It delineates the rhythm of the collective body of the multitude. Virno situates the multitude in “a continuum of affect, of communication and sociality” functioning as the “common from which the refrain of precarity is individuated as a series of iterations on labour and life” (quoted in Neilson & Rossiter, 2005). I read this as the syntax which entails flexibility, innovation, and a constitutive freedom. The rhythm of what Virno calls “the common” is a syntax of (non)locality. Capital, however, is relentlessly redoubling its efforts to direct the tempo toward maximum efficiency and profitability. Thus we come back to that tension between play and work. Play entails a flexibility from which emerge innovations that are social, economic, and political. Work, at least under the grammar of capital, renders flexibility precarious and innovation an instrument for profitability. It is within these tensions we might differently profit by considering remarks made not long ago that resonate with the syntax of the (non)local body: “the demand to combine the freedom of movement with the freedom of communication is social dynamite” (Bove, Empson, Lovink, Schneider, & Zehle, 2003). The collective body that can create that “social dynamite” is multiply possessed, but to which grammar will it acquiesce, or indeed refuse?

NOTES

- 1 When this quoted version of Facebook's Terms of Use circulated, there was an outcry, a public relations fiasco, and subsequently they were revised. As of June 2011, the pertinent section reads as follows:

[Y]ou grant us a non-exclusive, transferable, sub-licensable, royalty-free, worldwide license to use any IP content that you post on or in connection with Facebook ("IP License"). This IP License ends when you delete your IP content or your account unless your content has been shared with others, and they have not deleted it.

While this policy wording seems much more restrictive and benign, it is scarcely different in legal terms. In particular, the Terms begin with the following statement: "You own all of the content and information you post in Facebook, and you can control how it is shared." But such anodyne words have little legal status. As succinctly noted by legal scholars Jennifer Hendry and Kay E. Goodall (2010):

This provision regarding ownership is, in essence, almost entirely worthless due to the scope of the licence – although the user may own all of the Content they post on the site, Facebook does not, in fact, need to own the information because they are licensed to utilise it in whichever way they choose, regardless of ownership. It is like borrowing your parents' car – at no point do you ever claim to own it, but that does not really matter when you are driving around town.

For Facebook's Terms of Service, see <https://www.facebook.com/settings/?tab=privacy#!/terms.php>

- 2 It is beyond the scope of this chapter to provide adequate detail of Smythe's introduction of the audience commodity, thus readers may benefit from elsewhere examining what were called the famous "blindspot debates" of the late 1970s. Cf. Jhally (1982); Livant (1979, 1982); Murdock (1978); Smythe (1977, 1978).
- 3 Not only is Wright a thoughtful critic of the immaterial labor thesis but his book *Storming Heaven* (2002) offers perhaps the best English-language overview of Italian autonomist Marxism, the theoretico-practical crucible from which the very concept emerged.
- 4 While the original source for Lazzarato's article is Virno and Hardt's *Radical Thought in Italy* (1996), it has since been diffused throughout the Internet. Perhaps the richest such source is the Generation Online site (<http://www.generation-online.org/>), a veritable treasure trove that has a vast array of articles from a very broadly defined autonomist tradition and incisive materials on concepts ranging from "immaterial labor" to "biopower" to "general intellect."
- 5 O'Reilly (2005) uses this term to describe what many see the Internet has become: second-generation networked services. For example, Google would be a leading Web 2.0 entity as the efficacy of its search engine largely depends upon the collective activity of its users. Web 2.0 is what happens when the accretion of cultural knowledge, or the "general intellect" – in networked relations – becomes the primary dynamic of the Internet. Other Web 2.0 exemplars would be Twitter, Tumblr, wikis (open user-generated content sites like Wikipedia), and geosocial networks like Foursquare. Finally, all

variants of user-generated content, from content rating (Digg, Reddit) to user reviews (UrbanSpoon, Yelp) to “tagging” (Flickr, de.licio.us), are integral to this active turn in Internet usage.

- 6 See Coté and Pybus (2007, 2011).
- 7 The subjective reading takes its cues from Marx’s *Grundrisse*, specifically the section “Fragments on Machines.” In the autonomist reading, value is situated in the variable capital (the technical, cultural, and linguistic knowledge) of these new laboring subjectivities. It is this “subjective turn” that marks off much of what is unique about immaterial labor. This reading marks a key differentiation of autonomist thought from more orthodox Marxists who see this added value as accumulating in the fixed value of machinery.
- 8 Marx takes this quote from Goethe’s *Faust*, specifically Part 1, Act 5, where it comprises the chorus from a drinking song performed by the patrons in Auerbach’s Cellar. It is about the dangers of love and the dubious judgments its possession can sometimes render. Marx himself was quite possessed by this quote as he cited it three times, twice in *Capital 1* and once in *Capital 3*: “[Capital is] an animate monster which begins to ‘work’ as if its body were by love possessed” (Marx, 1977b, p. 302); “The money’s body is now by love possessed” (Marx, 1981, p. 517).
- 9 Proscribe means to prohibit and prescribe to endorse. These are terms commonly applied to grammar, describing its primary function. In other words, what grammar does is to prohibit or endorse combinatory word usage. As such, a particular syntax can be either grammatically prescribed or proscribed. Here I am transposing these terms from language usage to the body and technology, especially as related to capital. So when thinking in terms of a sensuous syntax, I refer to the sequence of bodily actions and techniques, particularly the communicative and affective actions of the social body. Bodily syntax is constantly being recalibrated in relation to different forms of technology; capital, in turn, proscribes and prescribes sensuous syntaxes guided by its governing logic of maximizing productivity and profitability.
- 10 “The prehistoric turn” is an attempt to enable us to better see, feel, and understand what might be called “McLuhan’s water” – the Canadian media theorist once famously quipped that while he did not know who discovered water, it certainly wasn’t the fish. My own “prehistoric turn” has been illuminated by the work of two innovative media theorists. First, Mark B. N. Hansen (2006a, 2006b), whose studies of new media are predicated on the recognition that media always already conditions our situation; that is, that human techno-genesis continuously calibrates and recalibrates the “natural” human. Second is Jussi Parikka, whose *Insect Media: An Archaeology of Animals and Technology* (2010) boldly steps out of the human realm in order to radically reassess media theory. His “posthuman turn” looks at everything from the organizational structure of the swarm to the affective sensorium of the tick to better understand contemporary digital culture.
- 11 Technics has a very specific philosophical lineage. It is derived from the Greek *tekhne*, which can be translated as craft or art. It also served in ancient Greece as a key marker of that which was not of the natural world (*physis*). As such, it helped construct a model of the “natural” human. This denigration of *tekhne* and its related artifice even applied to the realm of knowledge. True knowledge, or *episteme*, emanates from the interior of natural human, from the soul, whereas that from Sophistic *tekhne* is, by definition, not only goal-oriented or practical in the service of craft but inherently of lesser value.

- 12 The “general intellect” again comes from “Fragments on Machines” where Marx uses it to denote how collective general intelligence makes the productive force of abstract knowledge greater than that of physical exertion. An innovative interpretation was developed by autonomists, and one critical to this chapter. Instead of building up in machinery autonomists see general intellect manifesting in worker subjectivity – thus a key element of the aforementioned “subjective turn.” Virno writes: “Science, information, linguistic communication, and knowledge in general – rather than labour time – are now the central pillars on which production and wealth rest” (1996, p. 267). So you can think of the general intellect as the resource upon which immaterial labor draws for its productive force. Indeed, it is the new distributed forms of user-generated knowledge that make the 2.0 variant so potent.
- 13 I discuss this process and some of the related debates in much greater detail in Côté (2011).
- 14 See Côté (2011) for further detail on the constitutive relations between the human-technology and the constant recalibration of the human sensorium.

The Waning Distinction Between Private and Public

Net Locality and the Restructuring of Space

Adriana de Souza e Silva and Eric Gordon

ABSTRACT

Whether browsing for location-specific content on a desktop computer or using location services on a smartphone, physical location is a factor in how users experience information. In this chapter, Adriana de Souza e Silva and Eric Gordon name the context of located information production and retrieval “net locality.” They describe how net locality is transforming user experiences of the web and physical spaces by altering the logic with which data are organized and distributed. Net locality is changing how users occupy public and private spaces, they argue, as connections to other people and spaces become more flexible and porous. Finally, they identify two modes of surveillance inherent in net locality: top-down and collateral monitoring. The tracking of user location by government and corporations facilitates the former; users tracking each other for the purpose of social connection facilitate the latter. Each is constructive of power relations that affect the nature of location-based user interactions.

The Waning Distinction Between Private and Public: Net Locality and the Restructuring of Space

As people become more comfortable with the ubiquity of networks in their lives, they become less comfortable with being disconnected.¹ Leaving the house without a cell phone or getting in the car without a GPS device might cause feelings of anxiety because it suggests a momentary disconnect from the network. This ubiquitous network is what Mark Andrejevic (2007) called the “digital enclosure.” The web is no longer something that people access intermittently and only from desktops – it is increasingly something to which people feel perpetually connected. Desktop and mobile devices are windows into this network, but they no longer define the edges of the network. This greatly expanded web, which stretches seamlessly from our screens to our streets, is what we call networked locality (net locality). Net locality is a means of describing a context for networked communication that is increasingly oriented around the location of the user. From location-aware mobile devices to web-based maps, a new level of attention to physical location is transforming user experiences of the web and the logic with which data are organized and distributed. In addition, net locality points to a different understanding of urban spaces, now permeated with networked interactions. As such, the awareness of net localities is critical for the very conceptualization of new media – from a focus on digital networks that operated outside the constraints of the physical world to practices that occur primarily in urban (hybrid) spaces (de Souza e Silva, 2006; Graham, 2004).

While there are significant benefits to this flexible and ubiquitous network, there are costs as well. People have increased access to data and information of all sorts. But in order to access data, people also need to disclose personal information. The disclosure of personal information *per se* is not a problem. However, often people do not know what kind of information about them is stored in databases or how it is being used. And the unauthorized use of personal information might lead to privacy breaches (Andrejevic, 2007; Solove, 2008). In the growing sector of location-based services, privacy issues are pronounced because data about a user’s location are necessary for many location-based applications to function. For example, to use a location-based social network like Foursquare or even to take advantage of the Places feature on Facebook, it is necessary for users to disclose where they are. Even for those who enjoy the affordances of net locality, there is for some an accompanying anxiety with this form of personal disclosure. The act of sharing one’s location information with cell phone providers invokes dystopian Orwellian fantasies of total surveillance.

But traditional metaphors of top-down surveillance are no longer adequate to address these concerns, because the fashion in which people are surveilled and in which they surveil others is rather circular in orientation (Solove, 2004). Disclosing personal location does compromise people’s control over the use of their data; however, it also opens up the possibilities of controlling data to fortify the functional-

ity of personal location. In other words, location-aware technologies typically enable users to exclude people and information that are not immediately relevant to their situation. So while the fear of outside intrusion upon personal space and information threatens to remove personal control in public spaces, the increased capacity for personal control over physical space through information filtering presents other problems associated with social exclusion (de Souza e Silva & Frith, 2010a). The increased personalization of space introduced by new technologies suggests new kinds of exclusionary practices and shifts in power relationships that might challenge how spaces are experienced and who has access to those experiences. Mobile devices and digital maps are filters that can exclude all but existing “friends” or social connections, and all but familiar spaces. As such, privacy and control are two sides of the same coin. Within net locality, controlling the distribution of one’s location information is coupled with controlling the context and the corresponding affordances of sharing that information.

Net locality creates a paradox, where a personalized relationship to physical location simultaneously threatens and secures one’s control of physical space. The borders between public and private spaces have shifted throughout human history, influenced by social and economic changes, and specifically by the development of new transportation and communication technologies (Arendt, 1958; Gant & Kiesler, 2002; Sheller & Urry, 2003). Likewise, the increasing use of location-aware technologies challenges us to question the traditional borders between what is considered public and what has been considered private, suggesting a new cultural understanding of the meaning of privacy.

When Photography Becomes Cartography

Initiatives like Google Maps and Google Street View are reminders that the mapping of the world is extensive, and consumers are gaining a certain amount of comfort with that mapping, even if it facilitates new and unprecedented forms of surveillance. But there have been important moments of resistance to this surveillance, and these moments suggest that there are unresolved tensions over the boundary between public and private associated with location-aware technologies. Google’s mapping initiatives in particular have been at the center of these tensions. In this section, we consider some of the legal challenges posed to Google’s mapping projects and how those challenges have shaped the broader cultural dialogue about location data.

Google Street View adds to the functionality of Google Maps a photographic addendum to its mapped streets. Photographs of both sides of the street, taken by roving cameras mounted on cars, are spliced together to create an impression of photographic continuity and made available on web and mobile interfaces. Not surprisingly, this effort raised some privacy concerns, as people complained about having an image of themselves or personal effects attached to what is essentially a public

record. But when Google Street View first launched, the company had a strict policy in place for the removal or alteration of contested images. When San Francisco resident and Electronic Frontier Foundation (EFF) privacy advocate Kevin Bankston asked that his picture be removed from a street corner, Google replied with a request for his name, location of image, and copy of his driver's license. But Bankston was incensed by this demand: "Apparently, you have to jump through more hoops than a trained seal," he complained. "Perhaps they'd also like my mother's maiden name? Birth certificate? Urine sample?" (quoted in Poulsen, 2007). As a result of Bankston's protests, Google changed its policy, replacing the requirement of the driver's license with a signed statement of accuracy. The change in this policy resulted almost immediately in a windfall of new requests. Many people were unhappy with being part of a tacit public record that visually displayed their whereabouts. But most legal challenges have passed without incident for the company because privacy laws in the United States do not protect against being photographed in public space. Since all of Google's photographs were taken from public streets, the company is technically within its legal rights. However, Google's plans to expand to other countries have been interrupted by stricter privacy laws. Several European countries have denied Google access, while Canada and Australia have insisted on blurring out faces and license plates as a condition of entry.

As a means of assuaging growing privacy concerns, Google developed an application that would automatically blur faces and license plates beyond recognition. The response to this new feature was positive, but it did not succeed in staving off all lawsuits, as Google did not consider the privacy problems with photographing property. In April 2008, a Pittsburgh couple sued Google for invasion of privacy and trespassing, asserting that the Street View feature reduced the value of their home. Aaron and Christine Boring (*Boring v. Google, Inc.*, 2009) claimed that the "major component of their purchase decision was a desire for privacy" and Google's photographs compromised the integrity of that privacy (quoted in Slater, 2008). They also claimed that because they live on a private road, simply driving down the street with car-mounted cameras was an act of trespassing. This case is interesting because it is the first instance of a privacy suit against Google that was focused on property. It questioned to what extent one's personal property should be protected from being added to Google's "official record" of the searchable world.²

In the United States, the town of North Oaks, Minnesota, has positioned itself at the forefront of this battle. The city has banned Google from taking Street View photographs, claiming, in a manner similar to the Borings, that because all of its town roads are private, Google has no authority to photograph them. This St. Paul suburb of about 4,500 people was the first city to take action against Google's efforts, arguing that photographs taken from private streets are an act of trespassing, while satellite photographs are not (Amouth, 2008). The city sent a letter to Google in January 2008 asking that all photographs be taken down and destroyed. Google complied. Legal questions aside, the case of North Oaks points to some limits in the social tolerance for being mapped. By creating a cartographic record of these

photographs, Google has forced the connection between photographic surveillance and cartographic surveillance. Different than simply being photographed in a public space, when a photograph is located and given the functionality of a map, the private space or information of that photograph takes on a public function. So while some are opportunistic, these legal challenges are reflective of a perceived loss of agency and control over private spaces as photographs of these spaces acquire this new public functionality. At a macro level, it is not difficult to comprehend the benefits of making close-up images of the world searchable; but on a micro level, it is necessary to contend with the fact that the world is composed of people and their data. Making the world searchable is equated to locating and identifying users. Making every location findable presupposes that everyone wants to be found.

But Google's philosophy has always been that it is better to apologize than ask for permission.³ The privacy complaints about Street View were surely anticipated – minor details in the larger vision of making the world searchable. For Google, the attitude of not wanting to be found is a relic. It has been successful in selling that culture shift. These concerns are fringe; for many people, being found (both by oneself and by others) is tantamount to socialization. Getting on the map is a virtue, a marker of participation in a culture that, through no small effort from Google, values location.

The example of Google Maps points to a broader phenomenon. The possibility of having one's location information disclosed, whether a photograph or longitude and latitude coordinates, prompts serious concerns about the invasion of privacy and fears of surveillance, especially when the person being located has no control over who accesses that location information. The issue is not simply that the information is recorded, but also that the information is potentially used in a way that the subject of that information cannot control. The dividing line between private and public in the context of net locality is increasingly drawn by the level at which one feels that one has control over one's located information. This is most evident when we consider location-based services (LBS).

Making Location Data Public

LBS provide location-specific information for anyone with a GPS-equipped cell phone. This information can come in the form of advertisements, coupons, restaurant reviews, Wikipedia articles, or information about the location of nearby services, such as gas stations or coffee shops. While these services do not necessarily reveal their users' location to people nearby, users must allow the service provider to pinpoint their location to receive the desired information. And unbeknownst to many people using these services, this information is often shared with commercial partners, such as corporate sponsors and application developers. As a subset of LBS, location-based social networks (LBSNs) not only transmit the users' location information to the service provider, but also share this location with members of the

users' social network. For example, a Foursquare or Facebook Places user might be able to share her location with known people in her "friends" list, or, if she is using a service like LooptMix, with anybody in the vicinity who is using LooptMix.

The disclosure of one's location, either to service providers or to peers, is often framed by the media as an invasion of privacy – in this case, locational privacy. In an analysis of popular press accounts of LBS, Adriana de Souza e Silva and Jordan Frith (2010b) identified two main fears related to privacy: the fear of top-down surveillance (mostly from advertising companies and the government), and the fear of collateral surveillance, that is, disclosing one's location to other people.

Almost all LBS business models are based on location-based advertising. LBSNs, such as Facebook Places, Loopt, Foursquare, Whrrl, and Google Latitude, are all provided to users free of charge. The easiest way to monetize these services is through advertising. For example, when checking into a location with Foursquare, users can find coupons for nearby retail shops. Foursquare motivates participation through its internal structure of competition (badges and mayorships), as well as through its external reward structure (coupons and free stuff). Advertisements actually become a reward for the user. Location-based ads make the advertising more relevant to the user, almost like impulse purchasing in a supermarket checkout line. The assortment of candy bars and mints displayed in checkout lines is there to satisfy the immediate desires of shoppers in an impromptu fashion. Likewise, location-based advertising is based on a just-in-time model of consumer needs. One typically does not go to Foursquare to find coupons. But when coupons appear and are relevant both to past consumer behavior and to the location of the consumer, they motivate impulse purchases.⁴

However, consumers are often unaware of what LBS developers and mobile phone providers do with their location information. If location information is provided to advertisers, as the example above demonstrates, consumers most often have no choice but to receive ads if they want to use the service. They also generally cannot choose the type of ad they receive, and lack awareness about which companies receive updates of their location. At this point, LBS data-sharing practices and privacy policies are not clear to most consumers. The Federal Communications Commission (FCC) requires that services obtain consent from users before targeting them with mobile advertising, but that consent is often buried in the fine print of lengthy user agreements. Many users, however, are willing to consent to the terms of these privacy statements (usually without reading them) if they see value in the type of information they are receiving.

People obviously have differing levels of concern about the issue of personal privacy. As Raynes-Goldie (2010) has noted, "By 2003, the number of privacy pragmatists – that is, people who are concerned about their privacy but are willing to trade some of it for something beneficial – had risen" when compared both to privacy fundamentalists and to people unconcerned about privacy. This is in line with previous research, which states that users are willing to give out private information depending on their perception of the usefulness of the application offered to them

(Ackerman, Cranor, & Reagle, 1999; Ackerman, Kempf, & Miki, 2003; Barkuus & Dey, 2003). So, as LBS become more popular (and consequently more useful), users will likely be more willing to disclose location information. Indeed, according to ABI Research (2009), “the number of subscribers to handset-based location based services doubled in 2008 to more than 18 million.” The same report attests that while navigation continues to lead in terms of total subscribers, LBSN has the highest year-to-year growth rates of all mobile services. This suggests that simply disclosing one’s location is not a problem for the average user. Disclosing location information only becomes a problem when users are unaware of who owns the information about their location, and with whom their location is being shared.

In addition to concerns about unknowingly sharing location information with advertising companies, de Souza e Silva and Frith’s (2010b) study found that the popular press generally focuses on the concern that the government might be using location data to monitor people. For example, an *eWeek* article by Roy Mark from March 2009 put it this way: “When it comes to government surveillance, the legal interface between law enforcement and your phone and Internet service providers is a shadowy place, and it’s often unclear what kinds of data companies are willing to provide to the government” (Mark, 2009). The idea of companies sharing location information with the government is of grave concern to many people, and has been described by privacy advocates as “a catastrophic corruption of consent” (Warren, 2009).

In addition to the top-down surveillance we have been discussing, de Souza e Silva and Frith (2010b) also show that media accounts of LBS point to concerns about collateral surveillance, or “people tracking,” as some media outlets describe it. Collateral surveillance is the act of letting others – generally, those you know – know where you are. Location-based social networks and games are often the target of such concerns. These practices are associated with a loss of control over one’s personal location information. For example, a *Newsday* article had this to say: “Thanks to the sweet/creepy new Google Latitude, [stalking is] easier than ever” (“Google online tool,” 2009). The “fear of being tracked,” as the awareness of location is generally described (e.g., Mason, 2009), is frequently connected to unknowingly giving up location information. For instance, as John Markoff in the *New York Times* warned: “You may use your phone to find friends and restaurants, but somebody else may be using your phone to find you and find out about you” (Markoff, 2009). Or as David Rowan (2009), from *The Times*, warns: “Let’s just imagine that a jealous partner gains access to your unattended phone and enables Latitude without your knowledge.” In all these accounts, it is clear that news outlets frame issues of locational privacy in particular ways: They warn users about the dangers of collateral stalking and governmental surveillance, but they ignore the major implications of the public sharing of location data for the construction of social networks, our experience of public spaces, and our perception of privacy. The above-mentioned reported privacy breaches are not directly related to personal harm (Solove, 2008) but actually stem from losing control of one’s personal information. It is not that people’s

location information is inherently private – in fact, LBS are premised on information accessibility; it is that users and entities can *use* someone's location information in unpredictable ways.

In response to the popular press concerns about privacy, some software designers have created safeguards for users to control their privacy settings, such as the ability to select which people are allowed in their network, or the ability to hide location from specific users (de Souza e Silva & Frith, 2010a). However, users' comfort in the security of their information, or their ability to prevent location information from being accessed by unknown users, is still quite volatile. This volatility is likely caused by the lack of clarity in the privacy settings within many of these applications. It is difficult to understand what the settings mean, or even if they can be adjusted. For example, Foursquare's default setting is to share location information with all members of a user's network. The user can manually turn that feature off every time she checks into a location, but there is no way to choose some members of a network over others. Additionally, when checking into a place with Foursquare, users can automatically see other Foursquare users in the vicinity, even if they were not added to their network.

Similar concerns have been reported by users of location-based mobile games (LBMGs). In their study of the game *Mogi*, Licoppe and Inada (2009) describe a case perceived as stalking by one female player who could see a nearby, unidentified player on her mobile screen. Despite repeated requests by the female player, the anonymous player never disclosed his identity, resulting in feelings of fear that the digital stalking would cross over into physical space. This example demonstrates that awareness of location might lead to power asymmetries. Similarly, Licoppe and Inada (2006) describe situations in which both players see each other on their mobile screen, but only one claims he or she can see the other in the physical space of the city, leading to uncomfortable and almost fearful feelings in the player under the risk of losing her anonymity. They also suggest that at the core of an LBMG experience – what they call a culture of proximity – is the assumption that one's location is public, so such behaviors (which treat location as private) actually run counter to user expectations of location-aware technology.

However, the very assumptions and fears of *Mogi* players are rooted in not recognizing a more profound shift in the nature of how individuals perceive and acknowledge each other in city spaces. Location-aware technologies have the potential to make people's location publicly available, which contradicts traditional expectations of anonymity in city spaces (Lehtonen & Mänpää, 1997; Simmel, 1971). Whether people decide to share their location only with five friends in their social network, broadcast it openly online on Twitter, or share it with their cell phone provider, these different degrees of publicity problematize what it is to be anonymous in public spaces. For example, before location-aware applications, when riding in a bus, a passenger could look around and see other co-present people, but he would know very little about them. However, if a Foursquare player gets on a bus, he will be able not only to visualize on his mobile phone screen other passengers who are Foursquare players, but

also possibly to access personal information about them, such as their name and location history. Licoppe and Inada (2009) suggest that the wide use of location-based applications will force us to question how we manage social interactions in public spaces, leading to “the development of an interaction order founded on the public character of locations” (p. 123).

The increased popularity of LBS, and the corresponding social transactions premised on personal location information, is foundational to what we call net locality and is altering traditional notions of privacy. Comfort with locational privacy, in particular, is determined by the extent to which private information is made public on the terms established by the creator of that information. While distinctions are made between top-down and collateral surveillance, the expressed anxieties are the same: in a situation characterized by the public disclosure of information, the extent to which users control the conditions of this disclosure sets the terms of communication and the boundaries of private space. In the following section, we situate this shift in the public discourse about privacy within a longer history of the concept and expand on the power dynamics implicit in net locality.

Rethinking Privacy and Surveillance

Understanding how conceptions of privacy have changed over time might help explain how and why location-aware technologies challenge the meaning and experience of privacy and how users of these technologies perceive public and private spaces. In his book *Understanding Privacy*, Daniel Solove (2008) describes the various conceptions of privacy throughout the nineteenth and twentieth centuries. Solove criticizes these conceptions as being either too narrow or too broad, and proposes that we should instead understand privacy according to specific contextual situations. Conceptions of privacy have changed over the years; and at any given time, there is considerable disagreement about their meaning (Sheller & Urry, 2003). In US society, privacy was originally imagined as “the right to be let alone,” following Warren and Brandeis’s famous article “The Right to Privacy” (Warren & Brandeis, 1890). However, the idea of privacy has also been frequently addressed in relation to forms of power: as power to limit access to the self, power to conceal information about oneself, and power to have control over one’s personal information. As we have illustrated, the majority of privacy issues that arise within net localities are related to the fear of losing control and power over one’s (locational) information, and how to manage the public sharing of location.

Solove suggests that while the Big Brother metaphor was useful for addressing a number of privacy problems, it has severe limitations when it comes to the database problem. “The most significant shortcoming of the Big Brother metaphor is that it fails to focus on the appropriate form of power” (Solove, 2004, p. 34). Within the database logic explored by Solove, personal information is collected by machines,

instead of by one individual who can watch another's every movement. The personal information collected is generally not something that one would consider "private" (for example, name, race, marital status) and is therefore not seen as threatening. The main problem emerges, however, when this information is aggregated and used to construct what he calls "digital dossiers," which are used by corporations to predict behavioral and consumption patterns. Users generally have no control over what is done with their personal information once it is collected.

When it comes to location information, the situation is similar. LBS privacy statements are generally vague enough that they do not inform users about what kind of information is collected, who the partners are, and what they might do with the information. So the problem is less of a Big Brother-style, top-down surveillance and more of a lack of control about the destiny of collected information. According to Solove (2004), a more adequate metaphor to address information collection in the digital age is Franz Kafka's *The Trial*. Rather than focusing on centralized surveillance, as is the case of Big Brother, *The Trial* is about a bureaucratic system, which never informs the victim about the purpose of his trial, or the reason for information collection. The anxiety is about lack of control, and not about surveillance. In Solove's (2004) words, "the problem with databases and the practices associated with them is that they disempower people" (p. 41).⁵

Moving away from traditional ideas of top-down surveillance allows us to reconsider privacy in net localities. It is how we use information that matters, not just our ability to keep it secret. Simply disclosing one's location is not a problem *per se*, but it becomes one when users have no control of who accesses it and what is done with it. Often, when location information is aggregated through applications such as CitySense, it is used to predict people's behavior in the city. While this practice is not overtly harmful to the individual, it can be used to deliver location-specific advertisements or to create profiles of particular areas of the city (Gandy, 1993; Lyon, 2003).

Indeed, what we are witnessing with the development of net locality is a shift in the traditional model of top-down surveillance toward a more pervasive model of all-encompassing surveillance in which all individuals in the network know the position of all others. The actual function of this surveillance is unclear for most end users, and the threat unspecified, which, according to the popular press, is exactly what makes people fear the disclosure of their location (de Souza e Silva & Frith, 2010b). Since the popularization of camera phones and portable camcorders, it is clear that we have moved away from the Orwellian model of top-down surveillance.

Steve Mann and colleagues (2003) proposed the concept of *sousveillance* to describe ways by which individuals might be empowered through the use of portable communication technologies such as cell phones and camcorders. Mann's idea of *sousveillance* emphasizes a bottom-up approach by which users are able to neutralize surveillance by inverting its mechanism (i.e., allowing individuals to observe and control corporations and the government). However, as Matt Adams points out, "we are still locked in an Orwellian paradigm that has long since passed its sell by date" (quoted in de Souza e Silva & Sutko, 2009, p. 81). And he adds that *sousveillance* is

nothing new, given that it has been with us since the rise of the camcorder. Although it is possible to claim that individuals own an increasing number of *sousveillance* tools, what these tools generally contribute to is not a neutralization of surveillance but a creation of other forms of collateral, pervasive, and open surveillance by which everybody is able to keep track of everybody else.

Location-aware applications typically prompt anxiety because of the perceived absoluteness in which they locate the user. Someone or something knows exactly where you are at any given time. But locating somebody or disclosing information about someone is not necessarily an invasion of privacy. As Solove (2008) suggests, privacy issues need to be understood contextually. It is when information is taken out of context and used without notification or consent that users perceive a breach in privacy. For example, a Facebook Places user might choose to share her location with some of her Facebook friends without being aware that Facebook is using that information to deliver location-based advertisements. The use of her information is not consistent with her intentions regarding the service.

It is likely that these privacy concerns will continue to grow. But more likely the terms of the privacy debate will so radically depart from the present framework that what will constitute a breach and what will satisfy demand is now impossible to predict. With the increasing use of location-aware technologies that allow for different types of surveillance and data collection, it is natural that preexisting notions of privacy might be challenged and eventually changed. It is very unlikely, however, that privacy is dead, as some media accounts suggest. Privacy still matters; only, the terms of the debate are changing. It is no longer simply a matter of protecting the private from the public, as it is often a user's intention to make private information public. It is now a matter of being able to define and control the shifting boundaries between private and public. In the following section, we address this shift by examining how users bolster their sense of privacy through the "personalization" of public spaces.

Blurring the Line Between Private and Public Spaces

Technology constitutes society and is shaped and influenced by it (Castells, 2000). For example, with the introduction of new transportation and communication technologies there is often a challenge to established definitions of public and private. Gant and Kiesler (2002) note that with the popularization of rail transport in the mid-nineteenth century, the separation between work (public) and personal life (private) grew more definitive as people started commuting. While transportation technologies contributed to the creation of more distinct boundaries between the public and the private, communication technologies such as the telephone, the telegraph, and the television brought the public within the private space of home (Moore, 2004; Spigel, 1992). And this is even more pronounced with mobile

technologies (Bull, 2001, 2006; Gergen, 2002; Manguel, 1997; Sterne, 2003). Critics have accused the Walkman and the iPod of creating pockets of private spaces inside public spaces. Mobile listening devices raised concerns about the integrity of public space, as Hosokawa (1984, 1987) and Chalmers (1994) show. More generally speaking, mobile devices challenge where the private ends and the public begins (Fortunati, 2002; Gant & Kiesler, 2002; Katz & Aahkus, 2002; Ling, 2004; Puro, 2002).

Traditionally, the private space of the home has been envisioned as a controlled personal space in clear distinction from “uncontrolled” public spaces. But net localities challenge this. Users can wield more control over these public spaces by uploading and accessing place-specific information. As Eric Gordon (2009) has noted elsewhere, in a net locality, “private space is no longer defined solely as control over a geographic domain; it is control over the access and production of data within flexible information flows” (p. 26). So, beyond the traditional challenge of the public encroaching upon the private (transforming personal location information into public data), net localities exacerbate the problem of the private encroaching upon the public (users’ abilities to “personalize” public spaces by aggregating location data in accordance with their immediate and specific needs).

Of course, this ability is largely a matter of technical functionality, such as properly adjusting privacy settings. When users are not confident in their control over their privacy settings, they fear the loss of privacy. However, when users feel in control of their personal information and their ability to use it, they celebrate the possibility of connecting with other users and accessing location-based information (boyd, 2008; Solove, 2004). Giving up location information might be acceptable, as long as users feel they are in control of it and aware of what it entails. For example, Google Latitude’s privacy settings allow users to *lie* about their location by inserting it manually. Having their position visualized on a map at a fake location theoretically gives users the ultimate control over their location information. So, users might be more inclined to use a service like Google Latitude if they are made to feel in control over the nature of the location information they publicly disclose. In this case, the act of “privatizing” public spaces through LBS is really a matter of wielding information to feel in control within those spaces.

But how is this done? While some feelings of control might be cultivated by walking down the street with earbuds in and listening to a favorite album, it is important to distinguish between consuming media on a mobile device while in public and engaging with location information for the purpose of interacting with a space. For example, a book’s narrative is not necessarily about the place where it is being read; the voice of a cell phone conversation generally comes from elsewhere; and iPod’s songs are typically loaded independent of location. But location-aware technologies draw information from the physical surroundings. For example, a user equipped with a GPS-enabled cell phone in Times Square who opens the application WikiMe is able to read Wikipedia articles about Times Square. Similarly, if she decides to write a tweet about Times Square, that piece of information will be coded with the longitude and latitude (longlat) coordinates of that place. And location-based adver-

tisements are delivered to users based on their location in physical space. For instance, a Foursquare player who checks in to the neighborhood's Mexican restaurant might receive a coupon if the restaurant is registered with Foursquare. Besides accessing place-specific information in the form of articles, nearby restaurant reviews, coupons, and the location of surrounding gas stations and cafeterias, location-based social networks help users find other people who happen to be nearby.

Privacy Through Exclusion

One of the unfortunate and obvious side effects of the use of LBS is the potential for a different type of social divide between those who have access to the technology and those who do not. It is no longer simply location that is a determinant or marker of class, but also location awareness. The use of location-aware technologies can exclude those who do not use them. For example, if an individual is riding in a bus and opens Foursquare, she will be able to play and interact with other passengers who have Foursquare on their phones. She might also come to personally know these people, since they have some things in common (they similarly like games, own smart phones, and are riding the same bus). But the mobile interface might make her simultaneously pay attention to other nearby Foursquare players and ignore those passengers who are not using the application. This is distinct from the early days of mobile phones, when the devices were blamed for disconnecting people from their surroundings. Location-aware technologies generally do the exact opposite – they draw people's attention to their surrounding space. The difference here is that they introduce new forms of social differentiation into that space. Although these technologies increase the potential for communication and coordination with people who possess them, they might reduce communication with those who do not.

Spaces can become "overfiltered." Users can opt to encounter the same people and things, just as they tend to do on the web (Sunstein, 2006). In her empirical study of the mobile social network Dodgeball, Lee Humphreys (2007) observed that its users did not necessarily meet more people but instead hung out at different places with the same people. Humphreys also found that people used Dodgeball to meet existing friends out on the town and, in meeting those friends, did not necessarily connect to the general public, "thus leading to a kind of social molecularization" (p. 356). She affirmed that even when users did "meet new people through Dodgeball, these people were fairly demographically similar" (p. 356). In other words, the diversity of urban spaces may become masked in net localities. Rather than chance encounters of difference, she suggests that mobile social networks facilitate chance encounters of sameness.

But this analysis discounts the nuance of net localities and the importance of urban spaces for constructing social meaning. Even if a user of an LBSN is able to select and exclude individuals from engaging in her immediate social surroundings, the

resulting social processes do not necessarily lead to sameness. In fact, discovery is often facilitated by similarity (consider the experience of browsing books in a library). Also, the experience of space facilitated by LBSN is not solely premised on social encounters; information about spaces accessible through various applications can alter one's experience of those spaces significantly.

In any case, the urge to be among familiar things, people, and spaces is not solely a consequence of the use of new digital technologies, nor is it new. In the nineteenth century, sociologist Georg Simmel (1971) described the *blasé* attitude as a cultivated appearance of indifference used to protect the city dweller from the constant flood of stimulation. Simmel, while lamenting much about the "modern metropolis," understood that filtering was necessary to access renewed social opportunities and the corresponding enhancement of one's mental life. People in cities have always had the capacity to filter out what they did not want to see, from adopting an attitude to wearing earphones to consulting mobile devices. In the case of net localities, it is difficult to conclude that simply because there are filters, users will use them only to exclude. In fact, instead of redirecting users' attention to like-minded and physically absent networks, as is often the case with mobile phone conversations, location-aware technologies (re)direct the user to his or her immediate surroundings, which typically encompasses some difference.

But difference in everyday interactions with space is rarely something that people seek out. The feeling of being in control in public is often facilitated by an acknowledgment of the familiar. If a user knows there are people like her in a certain place, she is likely more comfortable going there. So, a place that is unfamiliar might gain familiarity if people using location-aware applications can "see" their social network before going there (Sutko & de Souza e Silva, 2011). Take CitySense as an example. The mobile application displays heatmaps that illustrate spatial concentrations of people in a given space. If a user notices that a number of people are congregating at a little known public beach that she is particularly fond of, she might be compelled to go there. The people one encounters in familiar places are themselves somewhat familiar because of their presence and affinity for the shared place. The difference, however, is that in the case of CitySense, the assessment of a place is done remotely via a mobile phone screen.

So, strategic filtering *and* the ability to assess a place before going there facilitate feelings of control amongst users of LBSNs. And there is some evidence that these communicative processes replace other forms of correspondence. For example, Nicolas Nova and Fabien Girardin (2009) tested their location-based mobile game *CatchBob!* (Nova & Girardin, 2007) in two modes: with and without mutual location awareness. One of their findings was that the presence of location awareness, that is, automatic detection of players' locations, led to a decrease in communication within the group. While this finding seems obvious (if you have information about each other's location, you do not need to call and ask for it), it points to changes in how people communicate in net localities. Some verbal communication is replaced by digital inference. This points to the fact that personal feelings of control are central

to communication in public spaces. How people negotiate these issues is transformative of the communication context in which people interact. As we have seen, the introduction of location-aware technologies might reduce one form of correspondence, just as it increases another. Location-aware technologies facilitate a diversity of experiences for those who possess them by allowing users to infer qualities about strangers based on where they are and, likewise, infer qualities about unfamiliar locations based on people they know.

Regardless of what sort of experiences location-aware technologies facilitate, people who do not have access to them no doubt experience spaces differently. David Wood and Stephen Graham (2005) call this “differential mobility.” They distinguish between two types of mobility: high mobility, pertaining to those few with easy access, and slow mobility, which includes the majority, who have difficult, blocked access. In this sense, mobility is directly related to power. At their core, location-aware technologies are contribute to this differential mobility. For example, the version of Loopt on Google’s Android phones provides place-specific traffic updates (Loopt, 2008), and those with access to the application might be able to reach their destination faster than those without access. However, as Wood and Graham note, differential mobility has always existed. From the moment some people rode or were carried while others walked, differences in mobility have existed, reflecting and reinforcing social hierarchies (p. 177).

The result is that people have markedly different experiences of the spaces they occupy and markedly different expectations of spaces depending on where they are. For example, two individuals walk side by side down a crowded street – one perceives the street as only a physical space and the other perceives it as a net locality. The physical space is unchanged for the individual excluded from the LBSN while the LBSN user perceives the physical space embedded with digital information. Previously, individuals could listen to music, read, or daydream. But the space they occupied was still the same space occupied by other people sharing that physical location. Location-aware technologies change this. Users can “customize” their experience of public spaces with features like LooptMix that allow a user to choose what type of person shows up on her map. This customization of space alters the nature of that space. LBSN and LBS in general create a type of “differential public space,” in which physically co-located people experience the same place very differently.

Conclusion

According to Manuel Castells (2009), “The sources of social power in our world have not changed fundamentally from our historical experience” (p. 50). What has changed, however, is that power is increasingly defined in the context of networks. With whom we interact and at what location are no longer just circumstances of society but the defining context of society. Net locality further establishes the importance of

networks in everyday life. While it provides an unprecedented control to some, through exclusion, it threatens to further exacerbate existing inequities. Location-aware technologies are normalizing information-rich spaces within everyday interactions; as such, they challenge widely held conceptions of private and public and introduce new methods of establishing personal control over these emerging information landscapes. As we have described, the distinction between public and private has shifted with each new communication and transportation technology; net locality marks yet another significant shift.

Governments can use location awareness to track how fast people are driving; some products are being marketed for individuals to track their spouses or their children; advertisers can easily use location information to target people with relevant ads. As Castells points out, networks define the context for power in society. And when people's physical locations are located and mapped within that network, the ability of networks to define the context of power is enhanced. In this chapter, we have demonstrated how issues of power are manifesting in public spaces, and specifically urban spaces, as people explore new practices with location-aware technologies and struggle with the pervasiveness of location information. As mapped and portable information becomes a more powerful mechanism for establishing boundaries between inside and outside, familiar and unfamiliar, social interactions are adjusting to these new dynamics. These shifting dynamics are foundational to what we call net locality and will continue to provide the context for urban social interactions in the early part of the twenty-first century. More and more spaces are information rich; physical landscapes are peppered with information about those landscapes and the people who occupy them. Whether one has access to that information and how one wields that information for personal control are the primary questions associated with net locality, and should be, as more and more media are consumed on mobile and portable devices, a central question for the future of media studies more generally.

NOTES

This chapter draws from one of the chapters in our book: Gordon and de Souza e Silva (2011).

- 1 While it is true that people in the developed world (a.k.a. Global North) have historically had more widespread access to the Internet and to telecommunication infrastructures, it is also important to highlight that increasingly countries in the Global South have access to information networks mostly through mobile communication technologies. The International Telecommunications Union 2010 statistics show that "access to mobile networks is now available to 90% of the world population and 80% of the population living in rural areas" (ITU, 2010). However, we shouldn't forget there is still a technological divide that increasingly consists of connection speed and type of technology (rather than access vs. no access), and that access to technology does not necessarily lead to social and economic inequalities.

- 2 Although there is a distinction between “privacy” and the idea of private property, we should keep in mind that privacy laws in the United States emerged as a response to possible threats to private property and to the self. As legal scholar Daniel Solove (2008) explains, privacy has been traditionally conceptualized within a rhetoric of harm: harm to oneself or to one’s personal property. In order for lawmakers and judges to create policies to protect privacy, they had to articulate why invading somebody’s privacy was problematic, and the most obvious way of doing that was by showing how privacy invasion might be harmful. So, although, following Solove, privacy is a multifaceted concept, its meaning has always been intrinsically connected to private property in US society. In fact, Solove (2008) points out that there are strict laws in US society that protect against surveillance in private places (p. 110).
- 3 This was certainly true with the Google Books initiative, its effort to copy the entire contents of five major research libraries, including Harvard, New York Public, and University of Michigan. While this effort has resulted in lawsuits from book publishers, before the complaints even surfaced the project was well on its way to completion.
- 4 This is similar to Google’s advertising strategy on the web that directs ads to users based on search histories, email content, and consumer behavior, and makes relevant commodities only clicks away from a given web “site.”
- 5 Manuel Castells (2009) also refutes the idea of a centralized power in the network society. He argues, “It is precisely because there is no unified power elite capable of keeping the programming and switching operations of all important networks under its control that more subtle, complex, and negotiated systems of power enforcement must be established” (p. 47).

How to Have Social Media in an Invisible Pandemic¹

Hepatitis C in the Time of H1N1

Lisa Cartwright

ABSTRACT

This essay examines the use of social media as platforms for public education about pandemics, focusing on the case of the 2009 H1N1 pandemic. Lisa Cartwright considers the 2009 H1N1 outbreak and its designation as a pandemic by organizations like the World Health Organization and the United States Centers for Disease Control and Prevention, comparing the public social media management of this pandemic to the media campaigns mounted to address previous outbreaks and pandemics. Using the example of hepatitis C (HCV), a pandemic of long duration managed without the same sensibility of urgency and crisis that marked the H1N1 campaigns, Cartwright analyzes the ways in which notions of *temporality* inform the pandemic concept, considering the mediation of HCV against the example of the heavy mediation of H1N1 in campaigns which were both market-oriented and driven by anxiety about pandemic futurity. This approach is particularly troubling in that it tends to miss pandemics like hepatitis C with a tendency to manifest slowly and imperceptibly, with an invisible but massive presence that is compounded by public health inattention. It is proposed that the chronicity of the hepatitis C virus does not match the temporality of social media, which is immediate and fast, and of health communication, which is also organized around immediacy and emergence, and also futurity and potential emergency. Cartwright argues

The International Encyclopedia of Media Studies, First Edition.

that we need to examine and rethink the social mediation of pandemics with attention to the respective temporal and visual conditions of the lives of viruses and their pandemics. More generally, a critique is put forth of the approach in public health characterized as pandemic futurity in which pandemic announcement serves as pandemic prevention, and anticipatory disease surveillance techniques inform the social mediation of designated outbreaks, epidemics, and pandemics.

Time, Visibility, and the Social Media Pandemic

In June of 2009 the World Health Organization (WHO) announced that the first influenza pandemic of the twenty-first century, and the first since 1968, was under-way (Chan, 2009). Director-General Margaret Chan expressed concern that the H1N1 outbreak, placed at the highest level on the agency's risk scale, would follow the pattern of prior flu pandemics and would be with us for months if not years to come (Lynn, 2009). For the leading world health agency to officially sound the pandemic risk alarm at the highest level was no small matter. A million deaths were attributed to the Hong Kong flu by the end of the 1968 pandemic (Paul, 2008), and 50 to a 100 times that were attributed to the Spanish flu of 1918–1919 (Barry, 2004). But Chan expressed optimism about the role that global disease surveillance and communication systems might play in staving off the worst: “No previous pandemic has been detected so early or watched so closely, in real-time, right at the very beginning,” she noted. “The world can now reap the benefits of investments, over the last five years, in pandemic preparedness” (Chan, 2009).

Public health messages proliferated in the months following the WHO H1N1 announcement as agencies such as the United States Centers for Disease Control and Prevention (CDC) tweeted and texted updates, uploaded public service announcement videos to YouTube, collaborated with their corporate “partners,” and “listened” to constituents, now called consumers, via Facebook and Twitter. CDC had been using a MySpace account since 2007 to direct its public to consumer health information at its site; the agency had launched its own Facebook profile in 2009 when public traffic overloaded its server. Signifiers of enlistment – H1N1 buttons, badges, content syndication, widgets – were offered on special social media pages along with information about where one could go to find public service announcements (PSAs), report news, and engage in online dialogue.² YouTube accounts with algorithms computing global demographic data collection made it possible for agency marketing experts to track hits. These data were useful not only to marketing but also in light of disease surveillance. It was obvious that we had moved past the days of using the pamphlet, the billboard, and the television PSA as primary means

of health communication in many parts of the world. This was known because social media analysts, using infodemiological and infoveillance social media tools tied to the very technologies of public outreach, had accrued hard evidence of the massive involvement of a vast global public in myriad H1N1 social media campaigns.³

A host of ironies emerge when we look back on the viral social mediation of the H1N1 pandemic. Foremost among them is the fact that while H1N1 may have been the first *flu* pandemic of the century, it was hardly the first pandemic. Two pandemics in particular – HIV and HCV (the hepatitis C virus) – had already bridged the millennia with their severity and virulence quietly intact. Using language that emphasizes the urgency of addressing emergent diseases in time to stave off future pandemics, the WHO pandemic page features flu among its examples, leaving out pandemics caused by other viral and bacterial agents, such as HIV and HCV. Unlike H1N1, these pandemics have been marked by extraordinary mortality and morbidity, as well as by longevity. In effect, these events fall to the margins of the concept of “pandemic,” with its relatively new emphasis on urgency, emergence, and futurity. HIV and HCV have not been the star subjects of the new social media public health campaigns. Instead, they are part of a set of pandemics that constitute by default the slow, pervasive, invisible, and dangerously normalized underside of the pandemic concept.

The H1N1 flu pandemic was extremely well mediated. It is, arguably, a prime example of successful pandemic response and eradication. Paradoxically, the messages of its media campaign were consistently weak. Social media platforms were used heavily during the crisis, and it has been reported that individuals tended to post reliable information (Chew & Eysenbach, 2010). But one of the curious characteristics of the exchanges posted is that it was widely agreed that there was not much to know, other than that one should watch and wait for new information and guidelines. A major task facing health communicators at the beginning of the social media campaign was semiotic: the virus needed to be rebranded away from the stigmatizing monikers “swine flu” (under which global pork sales suffered) and “Mexican flu” (Bradsher, 2009; Rushe, 2009). Recommendations about who should be vaccinated changed from week to week and varied from country to country. Aside from shifting vaccination guidelines, the dominant global public health message that emerged was the familiar admonishment to wash one’s hands often and well.⁴ Rising above ever-changing guidelines and the checkerboard of approaches emerging across the various national and global health agencies was the refrain “we just don’t know.”

As H1N1 failed to generate the extent of morbidity and mortality anticipated, the question was broached among health professionals, members of the press, and the public about whether this outbreak should have been classified a pandemic of the highest order at all. In numbers of deaths and severity of illness, H1N1 had begun to look more like a seasonal flu. Questions about classification were vexed by the fact that the WHO’s online description of a pandemic had recently been changed. Between 2003 and early May of 2009, the WHO Pandemic Preparedness home page stated: “An influenza pandemic occurs when a new influenza virus appears against

which the human population has no immunity, resulting in several simultaneous epidemics worldwide with enormous numbers of deaths and illness” (WHO, 2003). In early May of 2009, as H1N1 was ranked a phase 5 risk, Elizabeth Cohen, a CNN senior medical correspondent, drew attention to an anachronistic perception that plagued this description. Global flu outbreaks designated as pandemics no longer necessarily engender the large numbers of severe cases of illness and deaths that one might expect from a concept linked historically to outbreaks with actual extreme virulence, Cohen observed, leading her to ask, when is a pandemic *not* a pandemic? (Cohen, 2009).⁵ Shortly after Cohen’s article was published, the WHO changed its online description of the term pandemic, omitting the words “with enormous numbers of deaths and illness” while leaving in the factors of geographic distribution of outbreaks and low immunity to novel strains. This modified definition meant that the WHO would no longer need to wait for a disease outbreak to reach a morbidity threshold that qualified as “enormous” before publicly designating it a full pandemic. Shortly after this change was posted, the H1N1 pandemic was declared at phase 6, suggesting to many unaware of the changed description a situation of urgent virulence in which morbidity was already extreme and large-scale mortality was imminently possible.

In effect, the modified description of a pandemic released the WHO of the burden of waiting for a pandemic to be actual and visible before sounding the highest alarm. The concept of pandemic was free to serve semantically as a means of generating anticipatory anxiety, what Penelope Ironstone-Catterall, describing rhetorical constructions of risk in disaster movies, calls “anxious pandemic futurity” (Ironstone-Catterall, 2010, p. 92). In a shift that parallels the move to the strategy of using treatment as prevention, pandemic announcement is adopted as a rhetorical means of pandemic prevention. A pandemic state announced generates a state of agential watchfulness – agential in the sense that watchfulness is preventive. Disease begins to sound remarkably like weather: we watch and wait for the signs of a new storm’s accumulation of strength and follow its geographic course, tracking preliminary events to predict who is at risk and to prepare for what may happen to populations in a range of possible places that may be hit hardest. Indeed, the Pandemic Severity Index (PSI) introduced by the US Department of Health and Human Services in 2007 was modeled after a system designed to predict weather, the Saffir-Simpson Hurricane classification system introduced in 1971, which was in turn based on the Richter scale used to measure earthquakes.

Questions by health professionals and journalists about the call to designate the global outbreak a pandemic were fueled by reports that some members of the WHO’s H1N1 medical advisory committee had declarable financial ties to pharmaceutical companies that had precontracted with governments to produce the vaccine quickly in the event of need (Cohen & Carter, 2010; Sturcke & Bowcott, 2010). Within a year of the WHO H1N1 pandemic announcement, Fiona Godlee, editor in chief of the respected British medical journal *BMJ*, proposed that although we should be thankful the pandemic turned out to be a “damp squib,” the WHO should

be held accountable for triggering a global response that spurred governments to activate vaccine contracts right away on a massive scale (Godlee, 2010). The scope of the problem with anticipatory announcement was driven home in Britain when, even before the last shipments of the British health service's order had been delivered, the government had already begun strategizing about what to do with an anticipated surplus of up to 20 million doses (Sturcke & Bowcott, 2010).

Thus for some, the H1N1 case represents a disaster averted thanks to smart investments in medical surveillance and participatory media, while for others it was an alarm sounded at the wrong level with mixed motives (to enlist the public in prevention through announcement; to generate financial gain). Either way, the H1N1 event draws attention to the major implications of seemingly small changes in defining what constitutes a pandemic in a climate of anticipatory surveillance medicine and emergency communication.

In the pages that follow, I discuss the temporality of the pandemic concept and H1N1's lightning-fast mediation, its modeling of pandemic announcement as prevention, as a newly marketized approach to public health communication. I use this case as a basis for grasping the relative quiet surrounding HCV, a virus linked to a pandemic that precedes and outlives the H1N1 outbreak. I conclude with a discussion of the HCV pandemic itself, suggesting that the virus has been plagued with the conditions of silence and invisibility linked to its slow chronicity⁶ at every level, from the 30 years prior to its discovery (during which time it was named for the types of hepatitis it was *not*: NANBH, for non-A, non-B), to its current figuration as a chimeric "cloud of quasi-species," to the 2 to 30 or so years of its relatively symptomless progression in the body, to its stunning absence as anything other than a paradoxically timeless and elusive stalled cloud of a pandemic in public health social media. By situating HCV in its slowness and invisibility against H1N1's whirlwind history, I aim to make a convincing case that we need to slow down and rethink how we mediate pandemics through social media, and how we regard time and visibility in the contemporary notion of the pandemic. In 1998, physicians and researchers asked the question: "can science meet the challenges of the HCV pandemic?" (Roehr, 1998). I adapt this important question about science, a question that was urgent then and is urgent now but to which we can only answer, sadly, *we don't know*, to the media context, and to the language of strategies and tactics, shifting the emphasis away from knowledge and ability: How have social media experts met the challenge of the HCV pandemic, and how might we address it differently, within the terms of its unique chronicity? At the root of this challenge, I believe, is our ability to grasp and mitigate the emergence of *emergency* and *futurity* as dominant paradigms in public health communication about pandemics. Below I do not argue that we need to render HCV more visible or bring it into the temporal framework of emergency communication and the current tactics used in the social mediation of flu pandemics. Rather, I propose that we need to be aware of what gets missed in the language of emergence (of emergent viruses, emergency health communication) and in the anticipatory surveillance medicine that drives our media strategies for managing

pandemics into future time, producing tactics that work through a paradoxically banal panic logic of announcement as prevention. The anticipatory time of H1N1, I will be proposing, has dangerously elided recognition of a pandemic, one that is virulent and severe now. HCV is missed because it lives in slow time. It appears and rushes ahead in the body only when it is too late to address it as effectively as we may in earlier, less visible stages of the disease. We need a media model that will capture HCV in its unique chronicity, and that will render the virus in its own passively pessimistic terms of diminished visibility and constitutive absence, to fully grasp and address this vast banal pandemic before it becomes too late to make a difference in outcomes.

H1N1: Social Mediation in Anticipatory Time

“No previous pandemic has been detected so early or watched so closely, in real-time,” Chan explained of H1N1. Watching closely as a means of managing a flu pandemic, not just in real time but even before the pandemic appears with the severity associated with flu pandemics of the past, is a strategy that had been in the making for some time. David Armstrong introduced the concept of surveillance medicine in 1995 to describe the epidemiological technologies developed throughout the twentieth century that remapped the domains of illness to include spaces beyond the pathological body, the research lab, and the hospital. Healthy populations and the intersecting zones of everyday life were drawn into the realm of a medical gaze that entailed the implementation of new instruments of disease surveillance and communication. These tools extended the range and scale of detailed public health inspection, intervention, and promotion from the individual and interior and microscopic views, to include vast populations and disparate geographic regions (Armstrong, 1995). The classically panoptic medical gaze was disseminated and routinized in the last decades of the twentieth century by the introduction of digital imaging and wireless communication systems, which were integral to the advancement of notions of agency and choice in the implementation of new technologies of the self (Foucault, 1988). With the institution of digital medical surveillance and communication systems, publics, at the level of the individual, could be enlisted in the task of global surveillance for communicable and infectious chronic and emerging diseases (Burchell, 1993; Couldry, 2010; Rose, 1993), enacting global health schemes at the scale and through the efforts of the individual consumer as agent in self-health (Lupton, 1995; Porter, 2005; Rose, 2007). Consumer and professional technologies intersected as self-health became a key component of this expansion of the culture of surveillance into the routine practices of the individual, including the adoption of devices for self-monitoring, home testing, and online self-diagnosis and self-treatment. Individuals were enlisted as their own public health agents during the choice-driven climate of managed-care medicine in the neoliberal era.⁷

In the media studies context, it is helpful to think of the notion of an epidemiological remapping of health and disease in light of the satellite footprint, a concept introduced by Lisa Parks (2005) to understand the pervasive yet invisible presence of satellites. These instruments pervasively yet invisibly orbit around the planet, paradoxically mapping us from outside our range of vision, even as they facilitate our individual and constant engagement with the images they generate, engaging us in the paradoxical condition of disembodied emplacement. The visual paradigm of public health social media, from global epidemiology to everyday health consumer communication practices, is similarly structured around a paradox of the increased visibility and transparency of disease, not only as visible fact but also as potential. We recognize and identify ourselves as subjects of health in terms of the risks posed by our emplacement in an epidemiological field where we may not be actually sick, but we live in the anticipatory condition of potentially becoming so. The visibility of disease risk is coupled with a *lack* of transparency and visibility of the benignly pervasive technologies that paradoxically facilitate a public gaze that is anticipatory and prophylactic, even as we do not see or note these technologies of emplacement in disease potential. Looking becomes a benign form of waiting for something we dread and hope to prevent, something we have never actually seen and can barely visualize, through the very act of watching nothing happen. This is the basic principle of surveillant visibility: most of what is recorded on surveillance tape shows nothing; the system functions on the principle of hope that watching intently (recording data) will produce more of the same nothing – will not simply catch an event when it does happen, but will deter and prevent that anticipated event. Surveillance is anticipation as prevention. We use algorithms to compute and predict outcomes we cannot yet see, and we share these projections even when there is nothing yet to see. The principle of the precession of the simulacra emerges, in surveillant specularity, as a means of prevention of the dreaded Real.

This concept of an investment in technologies of watching linked to technologies of computational projection and public messaging took on greater urgency after 9/11. Anthrax posted through the US mail system shook public and professional confidence in national defense, revitalizing the notion that with the increased distribution of goods and services in modernity also comes the potential for the distribution of bodily dangers and risks requiring detection, management, and protection (Beck, 1986). The task of securing public health became more closely linked to technologies of national security with this novel convergence: what was weaponized was not just a biochemical substance but also the mail.⁸ Messaging as biological warfare was a relatively new phenomenon. “Investments in preparedness” was a phrase widely used in the 2000s to describe efforts among national and global health agencies to upgrade disease surveillance, bolster health communication, and detect pandemics-in-the-making.⁹ The phrase drew on the logic of surveillance that escalated in the twentieth century. It also built on the “digital turn” with its engagement of publics, at the level of the individual, as agents in emergency health management. Managing communication and transmission channels became an integral matter of

managing the circulation of physical infectious agents and not just information. The WHO launch of the Alert and Response Operations system in 1997 to identify outbreaks (renamed Global Alert and Response, or GAR) coincided with the implementation of digital technologies ranging from networked global surveillance and communications systems at the macro level to media communications aimed at individual website users. World health monitoring, predictive modeling, and multi-directional networked communication with the public at the individual level emerged as joint objectives for agency health communication systems.

In fact, H1N1 was the first pandemic for which public health agencies brought social media networks and strategies into play in large-scale campaigns at both these levels with such force. Social media venues were enlisted by health agencies to track and disseminate information about H1N1 and to build public trust nationally and globally through dialogic exchange between agencies and with and among constituents, simultaneously dubbed consumers (in keeping with the new market model) and users (in keeping with the language of new media). Historian Debra Blakely proposes that in the flu pandemics of the previous century, pamphlets, news media, and public service announcements did not simply educate and report but also influenced the nature and course of epidemics (Blakely, 2006). In the 2009 flu pandemic, the dynamics of health communication changed by enlisting the public, through social media, as individual agents in the process of producing news and educating networks of communities.¹⁰

During the post-9/11 anthrax event – dubbed Amerithrax by the FBI – public health agency communication divisions began to shift in their organizational structures to accommodate a convergence of concerns around national risk, health communication, and markets and consumption of goods and services. The shift to online communication coincided with an event that prompted concerns about the potential to use the mail system as a means of communicating disease indexically, as it were – through a system that entailed a geographically extensive chain of physical contact. Two weeks after 9/11, anthrax spores, contained in cryptic letters embedded with DNA code in an envelope addressed as if from a suburban school child, were mailed to two senators and news media offices. Five people, including postal workers who came into contact with the mail as it passed through the sorting room, died from inhalation of anthrax, and between 17 and 63 others became ill, some with skin infections (Cymet & Kerkvliet, 2004; Sarasin, 2006; Thompson, 2003). The anthrax event raised concerns about the appropriation of basic communication and media systems to convey disease through a global system that targeted individuals.

This event was a major impetus to the institution of a new model of health communication, one that could adapt quickly enough to address emergency health situations with due urgency. Marsha Vanderford, Director of the CDC Emergency Communication Branch and Chief of the CDC Emergency Risk Communication Branch, recounts the rush of the anthrax event in CDC's health communication sector: "I don't think I had ever been through an event where so much depended upon how well we communicated. [. . .] We were in a situation where the demand

for information and recommendations was tremendously high, and at the same time our knowledge about what was going on was changing all the time” (Vanderford, 2008). The CDC response to H1N1 was shaped by this precedent that foregrounded communication itself, both as a potential source of health risk and as a vital source of risk management.

At the time of the WHO declaration of the H1N1 pandemic, the CDC, the US Department of Health and Human Services (HHS), and the Food and Drug Administration (FDA) were already two months into a collaborative social media campaign to address another outbreak, this time of salmonella. As had been the case with anthrax, there was massive public demand for information about national safety, in this case of the peanut butter supply. The 2009 peanut butter salmonella outbreak was not just about public health but also about consumption – the safety of an archetypical inexpensive staple of the US diet was at stake. The FDA conducted inspections around the country that resulted in a sting operation in which federal marshals seized tainted peanuts, tracing the strain of *Salmonella Typhimurium* back to a Texas processing plant that was driven out of business by the publicity. The HHS, FDA, and CDC launched a collaborative social media push around the outbreak, and the CDC Social Media Center emerged out of this process (Turoczy, 2009). Peanut butter thus smoothed the way for the broad-scale, interagency use of social media in an explicitly designated social media campaign organized around health risk, national safety, and consumer protection.

Social marketing was an explicit feature of this social media campaign as well. This is the term used to describe the use of brand marketing strategies to “sell” emotional investment in cause- and rights-based initiatives and to promote behaviors (such as those linked to good hygiene) that typically escape market frameworks. The use of commercial marketing strategies to sell *social* good rather than commercial goods was subject to some theorizing in the early 1970s, when Philip Kotler and Gerald Zaltman, in a 1971 essay that is now a classic of cause-linked social media, revived a question posed by the mid-century US psychologist G. D. Wiebe: “why can’t you sell Brotherhood like you sell soap?”¹¹ The early history of social marketing includes numerous examples of medical, public health, and social hygiene causes promoted using the tools of advertisers and marketers. In fact, this history can be traced back to the earliest charity poster campaigns and radio and television public service announcements, and also to the history of selling commercial soap as a means of selling Western personal hygiene practices to colonial subjects. Wiebe, a research psychologist for the CBS radio network, was a 1950s analyst of public opinions and attitudes who performed an interesting reversal on earlier well-known media effects research projects like the Payne Studies.¹² Rather than looking for ways that mass media forms might promote behaviors regarded as degenerate, Wiebe asked how the persuasive powers of radio and television could be redirected to promote moral attitudes and behaviors (the reduction of juvenile delinquency is one of his examples), much as these forms had been used to direct audiences to buy into a culture that venerates and reproduces certain beauty standards (the home permanent wave

is his example) (Wiebe, 1951–1952, p. 680).¹³ He was an early proponent of the idea that advertising sells attitudes and sentiment, not just goods. Social-cause marketers of the 1970s were interested in spreading democratic will through an expanded capitalist framework that saw attitudes as commodity and investment capital that can be grown. This view was effectively subsumed by communication theories that were skeptical about the democratic potential of media persuasion methods, advertising, and consumption. Until the time of social media, the academic field of communication was for the most part not very optimistic about advertising's potential to "sell" progressive social change. Even in health communication the tendency until the late 1990s was to regard media as an educational tool for correcting a misinformed public, and the attitude that the appropriate role of public health communicators is to *educate* has persisted with the shift to a social marketing model in public health communication (Eysenbach, 2009). The explicit branding of public health communication under the sign of marketing rather than education is relatively recent. It coincides with the neoliberal turn, wherein the corporation emerges as a partner in public health, the citizen emerges as agential consumer or media user-as-producer in a health marketplace, and persuasion emerges as a benign and reciprocal fact of mediation, with the consumer messaging back and influencing the producer.

When the CDC formed its Emergency Risk Communication Branch, this entity was initially situated in the National Center for Health Marketing, which was for a time the organizational center of CDC's emergency communication response network (it was later dissolved). Marketing was thus brought explicitly into the federal public health picture in the decade after 9/11, when it was also coded in terms of security risk. This division was established as the locus of work around conditions that are understood as crises, addressing health events such as flu pandemics that unfold fast, with no time to lose.

Social Media and Reproducibility

I have proposed that the concept of pandemic, in the WHO sense, is centrally implicated in a politics of anticipatory visibility – a set of strategies that aim to make visible, and thereby avert, disease outbreaks in advance. This shifts how we understand disease relative to reproducibility, a concept that links contagion to mediation in ways that go beyond metaphor and analogy, as Kirsten Ostherr (2005), Patrick Wallis and Brigitte Nerlich (2005), and Priscilla Wald (2008) have so compellingly shown. In pandemics, cases of illness replicate not only due to the indexical action of contiguous body-to-body contact within a region, but also through the simultaneous multi-sited action of outbreaks that occur as bodies fly from continent to continent, leading to cases rhizomatically cropping up in multiple sites at once. Remote transmission, a concept familiar to media studies, becomes a concern that public health managers address, in turn, with rhetorical mediation about prevention that

results in real change in modes and rates of transmission. The media dynamic in which information travels from individual to global to individual with rapidity, bypassing the slow process of official communications, as is the case with social media exchanges, becomes an integral aspect of managing the physical logic of disease transmission from individual to individual across vast spaces. Social media provides entry points for mediation that match the rhizomatic structure of flows of pathogens across distances and borders. As Stefan Helmreich has noted, it is not by mere analogy that the language of viral infection was applied in computing cultures (Helmreich, 2000).

Pandemics are more strongly characterized by the qualities of newness and speed that are typical of digital news media transmission, as in the case of a new virus against which humans have not had time to build up immunity. Noncontiguous simultaneity poses a different way of computing reproducibility than epidemic numbers within a region.¹⁴ The designation of a pandemic indicates the need for multi-sited response and mitigation efforts, which means distributable media forms must be engaged as essential components of response – a perfect fit for distributed social media. In short, the pandemic scale is designed to identify and promote mediated management of a pandemic before it fully hits, while impact is still in part an imagined future, and also to privilege anticipation and potentiality as means for the individual agent to implement control strategies understood to be globally meaningful. This is not exactly a matter of visualizing and sharing pandemic news in the television-era mode of real time, as Chan suggested, but rather of invoking an imagined future based on the historical image of (flu) pandemics of the past, which health communication specialists may forestall in collaboration with vigilant members of a social media public.

H1N1's Shadow Archive:¹⁵ (Flu) Pandemics Past

The anticipatory leaning of the pandemic media model away from disease severity and toward risk understood on a geospatial and temporal, anticipatory model carries within it a shadow archive of historical imagery and information. Agencies like the WHO and the CDC must respond with full knowledge of the public's ability to bring to life online archives of past crises that were not detected in the making and (by implication) not averted. The collective animation of past disasters due to failures in defensive watching and warning systems, as we learned in 2011 when we saw video footage of tsunami waves engulfing stranded citizens in Japan, becomes a strong motivation to implement stronger anticipatory surveillance and communication media measures.¹⁶ In the case of H1N1, it was not the HIV epidemic or pandemic that was evoked by media reminiscences but past flu epidemics and the vast morbidity and mortality they engendered. Constructing the pandemic concept with flu as

its core example, the WHO inadvertently helped the specter of influenzas past to cast its shadow over the memory of HIV, the most mediated pandemic of our time.

Is HCV, in its silence and invisibility, without a history we can sense? We might ask, following Akira Mizuta Lippit (2005) in his consideration of atomic radiation and the condition of avisuality it produced, what is the archive of HCV, given its unique chronicity and in its unique historical relationship of avisuality not only in technologies of its social mediation, but also to its phenomenological life as a virus and as a pandemic? In another context, I hope to be able to show how HCV's archive is potentially a shadow archive not directly constituted by its own absence, but by the image of HIV. We might learn from the image-rich culture of HIV how to have social media in the HCV pandemic. HIV serves not just as a specter of a tragedy to avoid, but also as an archive of successful media activism, advocacy, and intervention. For the purposes of this essay, I will turn directly to HCV to ask how this pandemic has escaped the visual logic that would invite us to imagine and change the course of its increasingly threatening future.

HCV: An Invisible Pandemic in Slow Time

HCV is a notoriously silent and invisible virus, and one can say the same about its pandemic media campaign – its silence and invisibility have been profoundly lethal, and the situation escalates. It is estimated that 3% of the world's population is infected with HCV. The CDC places the estimate of people living with chronic HCV at 130 to 170 million, with 3 to 4 million new infections and more than 350,000 deaths due to HCV-related liver disease annually (CDC, 2011).¹⁷ At the time of this writing (summer 2011), there is no vaccine. The CDC describes the current treatment program as a cure;¹⁸ however, other sources have been hesitant to use this term without quotes around it, as what is known is that viral loads can be dropped to levels that tests cannot detect in the bloodstream. The intensive regimen of weekly injections of pegylated interferon and daily oral ribavirin for six months to a year may lower the viral load to undetectable levels in a percentage of people infected with the virus; however, it is not known for certain whether the virus is fully eradicated to the point where it will not resurface under conditions of severely compromised immunity, and treatment protocol time frames can vary from six months to a year based on levels of trust in the factor of detectability.¹⁹ The death rate from HCV is predicted to surpass that of AIDS (C. Everett Koop Institute, 2011). There is wide agreement that statistics are unreliable, estimates are probably low insofar as they emerge from a context of chronic underreporting and global paucity of adequate surveillance, educational outreach, and testing programs, and risk groups are poorly understood due to the stunningly wide prevalence of infection and subtypes of the virus. Former US Surgeon General C. Everett Koop captured the pervasive and

widespread nature of the pandemic in branding the HCV outreach and education website that he launched: “Hepatitis C: An Epidemic for *Anyone*.”

In the past three decades, the concepts of “emergent diseases” and “emergent viruses” have occupied scientists and politicians intensively, as they are believed to pose a new sort of biosocial and bioeconomic threat. But the idea of what constitutes “emergence,” as I have tried to show above, is complicated by factors such as risk, prediction, and – as should become clear below – the relative perceptibility of viral agents. Agencies have been slow in implementing surveillance and communication in response to the HCV pandemic. The emphasis on the temporal and spatial dimensions of emergence has resulted in a favoring of the fast-paced novel flu as the core of pandemic character, making the very framework of the concept less well matched to disease agents and pandemics that are not characterized by the same degrees of rapidity and immediacy as new viral strains or diseases that act quickly. HCV, a virus some would describe as one of the most profound health concerns of our century along with HIV, ironically has escaped the mechanisms of anticipatory visibility that steer health communication in the direction of emergency and risk, classifications that have not been designed to see the chronic, the slow, and the virulently invisible. H1N1 was ultimately not widely visualized, despite the wealth of social media messages devoted to it, because its incidence was lower and its severity was less pronounced than anticipated. HCV’s invisibility is a different matter. Invisibility is understood to be integral to the virus itself on every level, from its existence as a pandemic to its course in the body and to its status as a viral entity.

The Invisible Virus: Clones, Swarms, and Quasi-Species

The virus was “discovered” in a classic example of a precession of simulacra (Baudrillard, 1994) – a generation of models of the real that precede and make possible recognition of the real, shaping its conditions of being. In the 1970s a National Institutes of Health (NIH) research team demonstrated that most cases of hepatitis following blood transfusions were caused by neither hepatitis A nor hepatitis B. For almost three decades the suspected viral cause of liver disease in some people who had received blood transfusions went by the names NANB or NANBH, for non-A non-B hepatitis. NANB could neither be visualized nor grown in culture, nor could it be immunologically defined. Despite failure to isolate the virus through conventional methods, researchers firmly believed that a viral entity was at work in concentrations too low for identification. Its discovery was given impetus by research into HIV, also a retrovirus, the discovery of which was reported in 1983.²⁰ In 1987, a team of scientists working at the Chiron Corporation, a California multinational biotech firm, with D. W. Bradley, a CDC scientist, identified the virus indirectly, through a novel

molecular cloning process that offered a clone as proof without prior characterization of the infectious agent (Choo et al., 1989, p. 361). The DNA clone was derived from a blood-borne NANB hepatitis genome derived from a subject with active NANB hepatitis. This technique of identifying a viral agent for the first time through a clone was widely regarded as a major breakthrough in viral identification methods for science. The viral particles were determined, on the basis of the clone, to be not only highly mutable but also imperceptibly small – roughly 80 nanometers in diameter. (The clone was itself verified, not directly, but in its response to an assay of antibodies from a patient with NANB hepatitis.) For six years the team had tirelessly screened hundreds of millions of bacterial DNA clones derived from infected chimpanzees, but mutation was so rapid that they could not fix and isolate a single molecule. A sole HCV clone was eventually isolated using a screening method in which antibodies derived from a clinically diagnosed NANBH patient were used to identify an experimental DNA clone. Thus HCV was first identified through a clone that served as its authentication even before the virus was rendered directly perceptible (Choo et al., 1989; Kuo et al., 1989). In effect, HCV brought scientific discovery methods into the age of the postmodern simulacra by demonstrating Baudrillard's point that the sign of the real can precede the real (Baudrillard, 1994, p. 1). To simulate is to feign to have what one does not have (demonstrable proof) and thereby produce the conditions that may bring that entity into the sphere of perceptibility. The HCV discovery entailed exactly that process.

In addition to its characterization as invisible, silent, incredibly small, slow, and hard to culture, HCV is also described as highly mobile and changeable, existing in a swarm. HCV, like HIV and influenzas, is a retrovirus. It replicates and mutates quickly, resulting in a closely related but genetically diverse and changeable group of circulating cells that rapidly evolve to resist vaccine and antiviral drugs. A trillion particles are produced in the body each day. Genetic variants are called quasi-species, and the movement of these particles in groups is referred to as a swarm. Quasi-species in the HCV swarm include drug-resistant variants that are difficult to study closely – mutations that are not readily detectable by conventional methods of sequencing. It is difficult to characterize their temporal stability (Wang, 2011). A quantity of research literature on retroviruses considers the notion of the rapidly mutating, genetically diverse quasi-species that exists in a context described as a swarm. How is one to understand an entity, a virus, when its form is by definition mutable, random, a blur of many tiny particles in changing configurations? The swarm concept draws on groups in nature: birds and insects, for instance (Parikka, 2011), but also from artificial intelligence research (Parikka, 2007, pp. 243, 237) and theorizations of empire (Hardt & Negri, 2005, pp. 91–92). Swarm is the term used to characterize the collective behavior of particles or units in a decentralized, self-organized system. The term suggests a lack of representational clarity and pattern in a cloud that overwhelms; however, as Hardt and Negri explain with regard to intelligence in warfare, the swarm concept is historically based in the theorization and management of intelligence in communication: computers can be designed to

Figure 9.1 Hybridization of clone 81 cDNA to RNA. (A) spot hybridization (24) of 2, 4, or 12 μg of total liver RNA extracted (25) from either chronic NANBH-infected chimp 910 (a1 to a3) or from two control, uninfected animals (b1 to b3 and c1 to c3) with ^{32}P -labeled nick-translated clone 81 cDNA. (B) Spot hybridization of nucleic acid extracted from viral plasma pellets (22) before (spot 1) or after treatment with either excess deoxyribonuclease 1 (spot 2) or ribonuclease A (spot 3). Hybridization probe as in (A). (C) Each strand of clone 81 cDNA was subcloned into phage M13mp 18 and then labeled by incubating with Klenow *Escherichia coli* DNA polymerase 1 in the presence of hybridization probe primer (New England Biolabs) and $[\alpha\text{-}^{32}\text{P}]\text{dCTP}$ (23). Each probe was then hybridized to slot blots containing either identical portions of viral RNA derived from infectious plasma (a1 and b1) or 2 pg of purified clone 81 double-stranded cDNA (a2 and b2). (D) Northern blot analysis (26) of 30 μg of total RNA (track 1), 30 μg of unbound RNA (track 2), and 20 μg of bound RNA (track 3) after chromatography on oligo(dT)-cellulose (Collaborative Research). RNA was derived from the liver of infectious chimpanzee 910. Arrows indicate the relative migration of 28S and 18S ribosomal RNA. ^{32}P -labeled nick-translated clone 81 cDNA was used as the hybridization probe. *Source*: Q. L. Choo et al., "Isolation of a cDNA clone derived from a blood-borne non-A, non-B viral hepatitis genome." *Science*, 244(4902), 359–362. process information faster using swarm architecture; Rimbaud's beloved Communards swarmed like ants (Hardt & Negri, 2005, pp. 91–92). Though moving seemingly randomly, the swarm follows a logic that can be computed through algorithms designed to model and predict their complex dynamics. Although in microbiology “swarm” captures the lack of easy perceptibility, the cloud character of the hepatitis C virus in its multiplicity and mutability, it also explicitly suggests the anticipatory potential scientists feel toward their ability to design intelligent models and methods for the nonreductive discernment of the virus within the terms of its own complexity and temporality. Once again, the concept of anticipatory vision comes into play in a manner that encompasses both dread (the disease is terrible) and hope: swarms are decentralized but are within the terms of an intelligent communication system that can be modeled even if it cannot be seen, as the virus's novel discovery through cloning has already shown. To represent the virus is not to make a single particle visible (which has by now been done), but to grasp it in all of its mutability, temporality, and variety. It is a virus that is characterized not only by its status as a “first” for simulation as proof, but also as one of the “firsts” for the future of swarm nano-imaging. This is not just about seeing at the level of the molecular-invisible (Rose, 2007), but predictively imaging future difference and grasping multiplicity in transition.

One can also say that HCV is a virus that is not one, that is multiple, in simpler terms than the swarm of particles in which it consists. HCV is part of a series that by 2011 included six discrete viruses, with the hepatitis alphabet running from A to G (F was named only to be declassified later). Hepatitis C alone is subclassified into 11 genotypes, each of which has one to four subtypes.

It is partly for this reason – the multiplicity of the viral particles as swarm, of the virus as part of a series, and of the individual virus as a set of subtypes – that one often encounters the phrase “not well understood” in conjunction with discussions of the virus, even apart from its status as a disease over time and as a pandemic.

HCV's Slow Course: The Imperceptible Bodily Progression of the Disease

HCV is slow in its progression from chronic infection to active disease, hence its popular branding as a “silent” or “invisible” epidemic.²¹ Infection is blood to blood; routes of infection are neither well studied nor well understood apart from obvious sources such as needle sharing and transfusions. Seventy-five to eighty-five percent of people infected develop chronic infection, though most are not aware they have the virus for years, as the latency period of a chronic infection is decades long. A person who is infected may initially experience mild viral symptoms and then show no signs or symptoms of chronic infection or perceptible active liver involvement

until far into the stages of liver disease, 10 to 30 years later, at which point damage will be difficult if not impossible to treat. At that point, a possible consequence is liver failure unless a transplant can be performed. But what can be said about the latency period of a decade or more? For anyone familiar with its use around HIV in the 1980s, the word “latency” carries a particular sense of foreboding – what was at first characterized as latency was a period of multiple, complex, and sometimes subtle transformations – somatic, neurological. The relative scarcity of research into HCV co-occurring conditions thus far has created a kind of rhetorical latency around the unknowns buried inside that very term. The messages of early detection and treatment are not currently the focus of even those media campaigns that have been launched.²² Instead, the focus among current agency media campaigns is on behavioral risk factors around transmission, with the goal of bringing down the rate of new infections. This policy mirrors the approach used for emergent pandemics: treatment is a secondary level of media messages, beneath directives on infection routes and how to limit transmission. This is reflected not only in agency materials, but also in a wide range of public health campaigns internationally. The folly of ignoring millions of people in the latency phase has led former US Surgeon General C. Everett Koop to demand changes in policy and practice, but his arguments have been ignored for a decade and more.

The Invisible Pandemic: HCV as Unmediated Virus

“When is a pandemic not a pandemic?” This was the quip that Cohen used as the title for her CNN report on the WHO’s change in description of what constitutes a pandemic. In the case of HCV, we might ask the same question – not because the virus is limited in its severity of illness and deaths, but because it has failed to trigger a major public health communication response despite the magnitude of its severity over time. A quick rejoinder to the question would be that a pandemic is not a pandemic when it is announced but no public health media response follows. Taking the tongue-in-cheek approach a step further, let us blame the virus, taking to task its own recalcitrant invisibility. The slow pace of public health response seems to mimic the pace of viral progression. A report issued in 1998 by the US Congress Committee on Government Reform and Oversight warned of the consequences of continuing to handle the “silent epidemic” with a “mute public health response” (US Congress Committee, 1998). Despite the strong and direct language of this document and the ample evidence of the problem, surprisingly little has been done in the way of a concerted public health response in the interim. Activist, advocacy, and private non-profit organizations have taken up the slack in limited ways, but this can be no match for a pandemic of this magnitude, which requires coordinated national and global responses – like those we saw for the H1N1 emergency. The slow pace of HCV chronicity in the public health response was ironically modeled by the WHO in 2010.

The public waited while the agency, widely regarded as setting the example for national agencies around the world, quite literally removed its online fact sheet on HCV for a full year or more, replacing it for that period with this “temporary” message to the world: “this fact sheet is being updated.”²³

It is encouraging to know that in 2009, the CDC’s Division of Viral Hepatitis began fundraising and consumer research for a national education plan, to be called “Know More Hepatitis.” Although by summer of 2011 it had not yet been launched, the campaign is in its first of three phases: formulating strategy proposals for media outreach and research.²⁴ Impetus to move the communication agenda along comes from a widely anticipated report by the Institute of Medicine. This document repeats the basic message of the congressional report a dozen years earlier, calling for a national strategy for prevention and control of hepatitis C, and hepatitis B as well. The report was based on a new comprehensive study suggesting, unsurprisingly, that “these diseases are not widely recognized as serious health problems” and that current strategies of prevention and control are not working (Institute of Medicine, 2010). The report is undoubtedly important. Yet the degree to which it repeats the message of the 1998 report with the same apparent urgency gives it the character of a shadow, a ghost of a previous message. Its message is welcome but uncanny to encounter in the deep and long space that is emptiness of the avisual shadow archive that constitutes the response to the last iteration of this point, a space populated with so much more pathology and so many more deaths now counted.

If we are to imagine this pandemic to be like the weather, we might envision a stalled cloud, a system so vast we cannot sense its boundaries, its shape, or its direction of movement. One might have assumed that the surveillance and communication of HCV would unfold online like other news and public health issues in the 1990s, and that by the 2010s it would feature prominently in public health social media campaigns. The HCV campaign could have served as a model for coverage of later outbreaks like peanut salmonella and H1N1, just as AIDS media activism and advocacy campaigns served as a model for innovations in advocacy and cause marketing for breast cancer. But this was not the case. In this context of invisibility gone viral, we find a key figure from the AIDS crisis resurfacing in a new and unique role. C. Everett Koop, best known as the former US Surgeon General who in the 1980s was sidelined by Ronald Reagan when he tried to draw attention and resources to the impending crisis around AIDS, established a prominent site dedicated to HCV information through Dartmouth’s medical school. His media campaign identifies the HCV pandemic as the locus of “an impending human tragedy” without an adequate health communication response by national and world health agencies. Koop and others have criticized the CDC, and the general focus on the tip of the iceberg, for being both unbalanced and foolhardy. They argue the CDC strategy is missing the inevitability of an impending crisis that will be magnified precisely by willfully looking away from an emergent disease whose status is slowly unfolding over time.

The temporality of HCV does not match the temporality of either social media or health communication, organized as they are around immediacy, change, and

anxious watching and waiting for the sudden change. Ironically, the outcomes Koop warns of are characterized not by uncertainty but by a relatively high degree of probability over time. In an era of anticipatory surveillance and emergency communication, it is easy to ignore what is slow and what swarms around us like an immersive cloud, a mediating force the very pervasive of which leads us to fail to notice it – precisely an avisual shadow archive. The problem is not simply that the CDC is sidestepping its ability to address the emergence of the disease at a critical stage. The larger problem is that, while there is theoretical work on health and representation, we do not have a theory that captures the particular conditions of slow chronicity, avisuality, and banality that characterize this virus and its pandemic. HCV speaks to the media studies profession dramatically: it is a condition that calls out for new ways of thinking about mediation, signification, and knowledge concerning a matter with an urgency that is all about duration and visibility, but which challenges the limits of those very key terms of mediation. It gives us a vital text for thinking through absence as a constitutive force for which making visible is not the social cure.

Since the 1980s and 1990s there has been a decline in interest in semiotics and representation among theorists of the body. At the same time, there is an increase in attention to the phenomenal (if not also phenomenological) and affective experience, invoking, if not explicitly adopting frameworks to study, the empirical body. This shift to provisional, phenomenal, and experiential ways of interpreting embodiment has been in tandem with the rise of digital social media as a primary context through which health experience is negotiated. The affective turn accompanied the digital turn, and with the rise of social media, the mainstream media–countermedia split was no longer really viable. The digital turn to social media in the context of health and care of the self goes against the grain of claims made in new media theory about embodiment and the virtual. The media model that has emerged most prominently through social media has not foregrounded knowledge and information and their structures and protocols. Instead, it has emphasized the embodied engagement and interaction with healthcare information in social networks, in one's private spaces, as a source of involvement and imagined future resolution. Emphasis rests not on the knowledge or information shared, but on the condition of sharing and listening as what we notice and measure to evaluate a given health organization's effectiveness. That fact gets missed in most health media campaigns that try to use social media to generate information. Paula Treichler's 1999 essay, "How to Have Theory in an Epidemic," was a pivotal text: pivotal in the shift from the video–television–print media nexus in which AIDS activism of the 1980s and early 1990s was carried out, and to the convergent digital media–web–social media–mobile phones framework in which emergent pandemics are borne today. It is also pivotal in the shift in health and science discourse about matters of emergency from epidemic to pandemic, and in the shift in discursive epistemes from knowledge, information, and the human subject to embodiment, experience, and intersubjectivity as the terms by which we measure the effectiveness of a given set of practices, tools, and resources for world, community, and self care and health. The theory

about which Treichler wrote was not just critical theory; it was also the scientific theory of the era. “AIDS treatment activism did not depend on an us/them division,” she reminded her readers. Out of available resources it assembled a complex conception of the body framed as “provisional but nevertheless as a theory for everyday life” (Treichler, 1999, p. 298). Treichler’s essay told a narrative about a “radically democratic technoculture” dedicated to “getting drugs into bodies” (Treichler, 1999, p. 313). Her assertion, twice in this essay, that AIDS activism was about this treatment objective as well as about the mediation and signification of HIV/AIDs should be recalled in this moment of social mediation as we consider how to have social media in an invisible pandemic, where we must once again do this work of understanding the close relationship between the semiotic nature of a virus, its linguistic and material sensibility, and its impact on bodies over time. We might say that HCV, unlike HIV, has had no narrative arc. It is too late to ask how to have theory in an epidemic, as we must now ask not only how to have theory so far into a pandemic, but also how to have theory for an avial virus in a shadow pandemic at a weak moment in theory. Media studies is not the only field with chronic problems concerning time and visibility; in public health the problem is far more acute, and the stakes are higher. But when prevention is tied to social mediation it falls to media theorists to make strategies for working through the troubling logic of pandemic futurity which makes up the particulate cloud in which we compute and mediate as a way of life.

NOTES

- 1 The title of this essay references the title of Paula Treichler’s classic essay of 1991, “How to Have Theory in an Epidemic: The Evolution of AIDS Treatment Activism” (Treichler, 1999).
- 2 The selection of H1N1 buttons, badges, and widgets can be viewed at <http://www.cdc.gov/SocialMedia/Campaigns/h1n1/buttons.html>. Retrieved July 3, 2011.
- 3 Chew and Eysenbach announced that they had counted over two million tweet posts with “swine flu” and/or “H1N1” as keywords using Infovigil, software that offers automated coding for an infodemiological content analysis (Chew & Eysenbach, 2010). For an explanation of the terms “infodemiology” and “infoveillance,” see Eysenbach (2009).
- 4 See, for example, the CDC “Don’t Get, Don’t Spread” video linked to its “H1N1 (‘Swine Flu’) and You” home page, in which Dr. Joe Bresee of the CDC Influenza Division, appearing in his military uniform with pocket rank insignia fully legible in the shot to connote authority and to inspire confidence in his ability to protect, explains how not to get the flu. Hand-washing, depicted in detailed close-up on hands lathering under a running faucet, is the first cutaway from talking heads for a short sequence of lines of defense that includes one other example: a close-up on vaccine needles. Release date October 30, 2009, retrieved June 2, 2011, from http://www.cdc.gov/CDCTV/IR_DontGetDontSpread/index.html
- 5 On the question “when is an epidemic not an epidemic?” see Green et al. (2002).
- 6 On the analysis of chronicity see Elizabeth Freeman (2010), who offers a brilliant means of understanding the nuances of temporality. Although Freeman does not analyze medi-

cine or health, her book holds great potential for theorizing the temporality of illness experience and pandemic time.

- 7 On self-health as a progressive feminist practice, see Taylor (1996), Copelton (2004), and Murphy (2004). For a critique of self-health as a product of the neoliberal emphasis on the individual and personal choice, see Beck and Beck-Gershein (2001) and Eisler (2004).
- 8 An example of the routine intersection of technological advances in medicine and the military is the history of sonography as an underwater military detection device and as medical ultrasound diagnostics. See Yoxen (1987) and Kevles (1997, p. 234) on innovation in sonography across these domains. We should keep in mind the point made by Clay Shirky (in the Ted Talk noted as Shirky, 2009) that we should attend not just to the emergence of technological innovation but to its everyday, routine implementation and use, when the technology has become routinized and normalized. We might call the process interscriptive (drawing on the old language of inscription of a technique's ideology into a routine practice) to grasp the convergences of discourses and techniques across domains.
- 9 For example, Richard Besser, acting director of the US Centers for Disease Control and Prevention (CDC) at the time of the H1N1 crisis, was quoted in the New York Times stating that "investments in preparedness" led to early identification of the outbreak in the United States (New York Times, 2010).
- 10 Clay Shirky provides a good explanation of this concept of the social media consumer as producer in the Ted Talk listed herein as Shirky (2009).
- 11 Wiebe (1951–1952), as quoted in Kotler and Zaltman (1971). Kotler and Zaltman drop a clause from the Wiebe source and make brotherhood a proper noun. The original reads: "Why can't you sell brotherhood and rational thinking like you sell soap?" (Wiebe, 1951–1952, p. 679). For a detailed discussion of the rise of social media in public health, see Walsh, Rudd, Moeykens, and Moloney (1993).
- 12 The Payne Studies was a series of research studies conducted between 1929 and 1932 to consider the impact of movies on childhood morals and behavior. It is notorious for promulgating moralistic views about media influence and was used to justify censorship in the US film industry. See Black (1996).
- 13 Wiebe's emphasis on advertising's impact on behavior, not promotion of goods, is a fruitful avenue of investigation for future media studies work on the history of advertising. Interestingly, his concerns would later include the promotion of civil rights and moral conscience (Wiebe, 1958).
- 14 A phase 6 pandemic, according to the WHO scale of 2009, entails outbreaks in at least two countries in one of the WHO's regions, plus a third country in an additional region. For an account of the debates about scales and definitions, and for a representation of the pandemic scales used by the WHO, see Doshi (2011).
- 15 I borrow the concept of the shadow archive from Akira Mizuta Lippit who, in discussing Jacques Derrida (1998) on the archive of secrets ("of the secret itself there can be no archive"), proposes a theory of the shadow archive to account for that which is avial and its effects on the visual world (Lippit, 2005). Significantly, Lippit considers a crucial matter of the body, the temporality of pathology, and social mediation through visibility and visibility: his subject is the trace of the bodies materially impacted by light in the atomic blasts at Hiroshima and Nagasaki, and the phenomenological and epistemological changes that unfolded from the time of radiation exposure. Radiation pathology follows a complex chronicity, stochastic time, with its own complex dynamics of visibility and aviality.

- 16 An example of an early watching and warning system's failure is the Indian Ocean system for early warning of imminent tsunamis, which has been under development since the loss of 200,000 people to a tsunami in Java in 2004, followed by a loss of 500 people to a tsunami in 2006. The system entails installation of seismic detection instrumentation, ocean pressure sensors, and tide gauges as well as communication alert systems. See Smith-Spark (2006).
- 17 By comparison, the estimated number of people living with HIV rose from around 8 million in 1990 to 33 million by the end of 2009 (UNAIDS, 2010). See UNAIDS (2010) for further figures.
- 18 Forty to fifty percent of people with HCV genotype 1, the most common genotype in the United States, respond to the current standard treatment. A higher percentage of people with genotype 3 respond successfully. The regimen has significant physical and psychological side effects, including compromised immunity and depression, and therefore not everyone can sustain the treatment. At the time of this writing, a third retroviral drug, telaprevir, became available as an addition to the standard treatment of interferon and ribavirin, and its inclusion has been shown to increase the rate of response among those with genotype 1. See McHutchison et al. (2010).
- 19 For an example of the use of quotes and discussion of the issue of cure, see BBC News (2007), where it was reported that "the treatments were known to work initially but it had been unclear whether the virus would come back," and a cure rate of 99% was reported for patients followed for seven years after undetectable levels of HCV had been sustained. On the use of the language of cure in quotes and the problematic tendency to emphasize emergence in news about cure, see Metcalfe (2007). In late 2010 the protocol at some hospitals was six months to a year, even in the case of a drop in viral load to undetectable in the first three months. The possibility of lingering particles of virus hiding out within a hard-to-detect place, for example in bone marrow, makes the determination of treatment duration difficult to fix. Stretchy and slow time is found even in the weekly treatment at the level of the body. The interferon is "pegylated." Pegylation is a technique that makes the drug stay in the body longer by providing a mechanism that makes it attach to other molecules in the blood, hence an injection may maintain effectiveness over many days, making it possible to administer interferon in weekly rather than daily injections.
- 20 Discovery is of course a fraught concept insofar as it buries the complex economy and politics of laboratory practice and personal and national interests behind the genesis of scientific facts. International contest over the discovery of HIV is well documented. See Feldman (1992). The discovery of HCV is similarly subject to questions about authorship and questions of related patent matters.
- 21 I use the term branding to suggest the pervasiveness of this tag. A Google search for the words "hepatitis C invisible" conducted on July 2, 2011, yielded over 800,000 hits on sites not devoted to hepatitis specifically, ranging from nonprofit health organizations (e.g., the Chronic Illness Alliance), to news media outlets (e.g., Newsweek has published a number of stories featuring this concept in the past decade), to professional journals (e.g., the National Review of Medicine).
- 22 Portions of this essay analyzing media campaigns and the precedence of HIV/AIDS media campaigns have been omitted here due to length and will be the subject of another publication. Some of the more effective HCV media campaigns are the Hepatitis C Project campaign, the Hepatitis C Harm Reduction Project (a resource for illicit drug

injectors), Catalyst Foundation's use of social media to promote TextGiving microcharity (where \$10 donations can be made by text for HCV testing and treatment), and the 2006 "Face It" campaign of the UK National Health Service featuring faces representing the vast range of people with HCV.

- 23 The temporary message directed inquiries to a generic email address at the WHO. The personal email correspondence that I conducted with communication officers at this address revealed that other pandemics (most urgently malaria) were consuming the time of an overworked staff, making it impossible to complete and post the updated HCV fact sheet for more than a year. An updated HCV fact sheet was posted in June 2011. See WHO (2011).
- 24 Personal notes from National Hepatitis Campaign Webinar led by Cynthia Jorgensen, Lead for Communication, Education, and Training, CDC Division of Viral Hepatitis, July 8, 2011.

Mobile Handsets from the Bottom Up

Appropriation and Innovation in the Global South

Cara Wallis, Jack Linchuan Qiu, and Rich Ling

ABSTRACT

This chapter provides a general mapping of grassroots practices associated with an alternative mobile handset culture that has emerged from the bottom up in the Global South. The authors highlight the social, economic, and institutional factors – in local as well as transnational contexts – that have contributed to “flexible” handsets and grassroots practices within this alternative model of social innovation. Drawing upon theories of user appropriation, they discuss three factors – economic constraints, flexible manufacturing, and cultures of tinkering – that have led to innovative handset production, consumption, and circulation. They then outline a general taxonomy of alternative, or flexible, handsets that includes used, refurbished, *shanzhai* (“bandit”), and counterfeit phones. They also discuss the importance of other cultural, social, and demographic factors – including age, gender, and locality – and show how various types of relationships – at the familial, peer, community, national, and even international level – sustain and are sustained by this multi-tiered handset ecology. Though the authors pay particular attention to China, such bottom-up innovation takes place in diverse contexts across the globe. In focusing especially on the information have-less (Qiu, 2009) – those with limited economic and social power in society – this chapter disrupts conventional notions of who holds authority in technology design and usage.

Introduction

The setting could be a hole-in-the-wall that serves as a shop in a narrow alley in Guangzhou, a cart on a dusty street on the outskirts of Accra, a bustling marketplace in Bangalore, or a tiny storefront near downtown Los Angeles' garment district. At such locales, men and women hawk an array of mobile phone cards and accessories as well as various types of handsets,¹ including some that flash with disco lights to signal an incoming call or bear a "Mi-Obama" label with the slogan "Yes We Can."² Workers fix broken phones, construct bastardized phones out of mismatched parts, and sell phones that have been brought to the premises through both legitimate and questionable means. The clientele of such establishments also practice their own forms of bricolage: sharing mobile phones, changing out SIM cards, "flashing," reconfiguring the handset, and engaging in other creative uses not necessarily conceived of by designers. Though separated by language, culture, and geography, what all of these individuals share is that they have begun to form a chain of grassroots mobile innovation. Although such alternative handsets and practices are primarily located in the Global South, they can also be found in low-income, largely immigrant communities in cities in the developed world.

As mobile telephony has diffused across the globe, technological innovations associated with mobile communications are often thought to emanate from the West or from Japan, where global manufacturers such as Apple, Nokia, or Samsung spend millions of dollars on research, design, and marketing. In cooperation with an operator, who often locks the phone to its network and adds proprietary software, the handset is then distributed to an end user in a formal commercial interaction complete with contracts, warranties, and receipts. The model we suggest – which we term "bottom-up," "grassroots," "alternative," or "flexible" to signify that it exists outside the mainstream model of capitalist consumption and of the global brands – highlights instead the emergence of a diverse array of innovative modes of production and consumption that often blur the distinction between these two terms. For example, unlike the situation in developed countries where a new handset comes pre-packaged in a shrink-wrapped box, the mobile phone in developing countries is often constructed, in one way or another, "on site." This may involve unlocking the software, replacing different components such as the keypad or the screen, or it might include composing a completely new device using the bits and pieces from discarded phones. Indeed, even after an individual has bought a handset, there could be further modification of the device, either intentionally or unintentionally. In the developing world as elsewhere, users – especially youth – often decorate phones with stickers or jewelry, change the cover, or in other ways deliberately modify the outside appearance of the phone (Fujimoto, 2005; Hjorth, 2009). However, if lack of electricity compels a user to consign his or her phone to a recharging service, an unscrupulous proprietor may substitute a good battery with one of lower quality, unbeknownst to the owner. All of these elements speak to a plasticity or "flexibility" in the social

construction of the handset. They also give new depth to the idea of the social shaping of technology, one that goes well beyond what is seen in the developed world. Such an alternative handset culture – reaching from producers, to distributors, to users, and extending to agents and repair people with whom the owner interacts after purchasing the phone – arises within myriad relationships in particular contexts and requires that we rethink traditional models of both the manufacture and the social shaping of technology.

In this chapter, we seek to provide a general mapping of grassroots practices associated with an alternative mobile handset culture that has emerged from the bottom up in the Global South. We highlight the social, economic, and institutional factors, in local as well as transnational contexts, that have contributed to “flexible” handsets and grassroots practices within this alternative model of social innovation. Drawing upon theories of user appropriation, we discuss three factors – economic constraints, flexible manufacturing, and cultures of tinkering – that have led to innovative handset production, consumption, and circulation. We then outline a general taxonomy of alternative, or flexible, handsets that includes used, refurbished, *shanzhai* (or bandit), and counterfeit phones. In the process, we show how various types of relationships – at the familial, peer, community, national, and even international level – sustain and are sustained by this multi-tiered handset ecology.

Although we discuss practices in locations as diverse as Bangalore, Istanbul, the Philippines, and Copenhagen, we pay particular attention to China as representative of bottom-up innovation in mobile telephony. Our emphasis, however, is on processes rather than on particular places. Moreover, we focus specifically on the “information have-less” – i.e., those who are economically and socially marginalized and thus use lower-cost and sometimes less convenient forms of new communication technologies (Cartier, Castells, & Qiu, 2005; Qiu, 2009) – to understand how they exercise agency and creativity in accessing and shaping technology within the material constraints of their lives. Although certainly financial limitations affect how such users appropriate technology, we highlight other cultural, social, and demographic factors that are equally important, including age, gender, and locality. Through critically analyzing a range of innovative production and consumption practices, this chapter seeks to add to our understanding of how particular social and cultural groups produce various local understandings of technology. In focusing on those with limited economic and social power in society, we hope to disrupt conventional notions of who holds authority in technology design and usage.

Technology Appropriation

The mobile phone’s diffusion across all corners of the globe and at all levels of society offers an unprecedented opportunity for deepening our understanding of how technologies are produced, taken up, and used by different people in diverse contexts. A

large body of work has examined how various technologies have been shaped through interactions and negotiations between designers, developers, and end users who engage in “interpretive flexibility” around a technology until a point of “closure” and stabilization is realized (Bijker, 1995; Pinch & Bijker, 1984). Scholars have also analyzed the so-called “domestication” of technologies, or how users take the devices from the commercial world and place them into their everyday lives (Berker, Hartmann, Punie, & Ward, 2006; Silverstone, Hirsch, & Morley, 1992). Studies of the telephone (Fischer, 1992; Martin, 1991) and more recently the mobile phone (Ito, Okabe, & Matsuda, 2005; Katz & Aakhus, 2002; Ling, 2004) have also shown how a range of social actors – designers, manufacturers, marketers, middle-class users – have contributed to how these communication technologies have been understood and used in society.

We share with the above body of work an insistence on the constitutive nature of technology and society, yet we shift the focus by looking at an entire circuit of alternative handset consumption and production among the information have-less in the Global South. Rather than analyzing the decisions that go into purchasing and “domesticating” a technology, we show how certain types of handsets are obtained, sustained, and reinvented within limited economic circumstances and numerous sociocultural constraints. Because we are concerned with how users “make do” and innovate from the bottom up, we draw from theories of technology appropriation that have highlighted power differentials in the global flow of knowledge, communication, and technology, in particular Ron Eglash’s (2004) notion of “appropriated technologies” and Bar, Pisani, and Weber’s (2007) model of mobile appropriation.

As Eglash (2004) notes, technology not only flows along an axis of production to consumption but also depends on users’ geographic location, social power, gender, ethnicity, and so on. He uses the term “appropriated technologies” to denote how those who are socially and/or economically marginalized reinterpret, adapt, or reinvent technologies invented in the traditional locales of global influence. In his formulation, “reinterpretation” means “change in semantic association with little or no change in use or structure” (p. x); “adaptation” involves “change in both semantic association and use” as well as a “violation of [...] intended purpose” (p. xi), thus implying user creativity; and “reinterpretation” entails changes to “semantics, use, and structure” (p. xii). Appropriated technologies can run the gamut from radical reinterpretation to use of a certain technology by groups not initially considered by designers, such as those at the margins and thus not thought capable of using “elite” devices. As Eglash argues, *“movement along the axis of social power is just as important in defining appropriated technologies as movement along the consumption–production axis”* (p. xv, emphasis in original).

Whereas Eglash outlines a framework for technology appropriation more generally, Bar and colleagues (2007) theorize mobile phone adoption, appropriation, and reconfiguration. In their approach, appropriation is the crucial site for user experimentation and innovation. Finding inspiration in Latin America, with its mix of peoples and cultures, they develop a three-pronged model of user appropriation. It includes, first,

“baroque” layering, where users “fill in” the spaces that manufacturers and operators provide for them, such as personalizing a phone with special wallpaper. Second, there is “creolization,” which involves a process of mixing, with the result being a new, hybrid form. Finally, there is cannibalization, which is appropriation through “dismantling, absorption, and chemical transformation” (p. 15). All of these are ideal types and can blend into one another, but they “represent increasing degrees of power contestation by users (and growing challenges to the established structure), as well as increasing engagement with ‘doing’ technology (rather than simply ‘using’ it)” (p. 24).

Eglash’s (2004) and Bar et al.’s (2007) appropriation frameworks are useful to our analysis for three reasons. First, they draw attention to issues of social power and inequality that cannot be overlooked when studying technology use among marginalized populations. Second, they highlight users’ agency and creativity in incorporating technology into their lives. Third, both frameworks attempt to understand appropriation in terms of a continuum from minimal to radical modification of a technology by users. In the discussion that follows, we note how some of the alternative handsets in our taxonomy could be placed into the aforementioned categories of reinterpretation, adaptation, and reinvention, or baroque layering, creolization, and cannibalization, but our main goal is to reveal varying degrees of modification to typical uses, structures, and meanings of mobile phones. Our definition of innovation is thus quite broad; we mean the term to denote technical innovations, such as the *shanzhai* phones discussed later, as well as practices that go against norms of capitalist consumption, such as the extended life given to phones through reuse and refurbishing. Although our taxonomy focuses on the actual “tool” itself – the mobile handset – we do not view technology as a distinct object separate from social life, but rather the opposite. We distinguish types of alternative handsets in order to generate insights into the needs, meanings, relationships, and investments (emotional and financial) that give rise to a grassroots mobile handset ecology embedded in the everyday lives of users.

Most frameworks of technology appropriation focus on what occurs once a user has already adopted a technology. For example, although Bar et al. (2007) acknowledge that manufacturers and providers might co-opt user innovation into future designs and services, they do not take into account innovations in design, manufacturing, and distribution that can also occur outside of the dominant model of the global handset manufacturers and operators. In our study, we focus on the broad social shaping process of alternative handsets. We therefore widen our scope to include the entire Global South, where in recent years the phenomenon of user appropriation has not only expanded but should also be seen in the larger context of several levels of innovation as well as transborder connections among the Southern countries. Therefore, we focus on modes of user appropriation embedded in familial, peer, and community relationships while also revealing a relatively more centralized pattern of “flexible manufacturing” in terms of research and development, production, wholesale, and retail, as seen in the rise of China as a global mobile manufacturing power, which will be discussed in more detail below. To set the stage

for this discussion, we first examine the diffusion of mobile telephony and manufacture in recent years in both the developed and developing worlds.

Diffusion and Manufacture of Mobile Phones

While the mobile phone was first developed and adopted in Europe, Japan, and the United States, the preponderance of phones is now found in developing countries. According to the International Telecommunications Union (ITU), in 2010 there were about 75 mobile telephone subscriptions for every 100 persons in the world (ITU, 2010b). If we simply consider the number of subscriptions, the greatest numbers are found in the most populous countries, including China (747 million subscriptions in 2009), India (525 million), the United States (285 million), Russia (230 million), and Brazil (173 million). At the bottom of this list are small countries like Tuvalu (2,000 subscriptions), the Marshall Islands (3,000), Kiribati (1,000), and Palau (13,156) (ITU, 2010a). These numbers point to the diffusion of mobile phones in a country.

However, if we examine the number of phone subscriptions per 100 persons, a different picture arises. Figure 10.1 displays the actual density of mobile phones in a population according to the gross domestic product (GDP) of a country (sorted into three groups ranging from lowest to highest GDP). Though not shown in the chart, tiny Palau, with 64 subscriptions per 100 inhabitants, is somewhat ahead of both China (55 per 100 inhabitants) and India (43).

Figure 10.1 Mobile telephone subscriptions per 100 inhabitants, 2000–2010 by GDP.
Source: Adapted from International Telecommunication Union data found at <http://www.itu.int/ITU-D/ict/definitions/regions/index.html>.

In this metric, the countries with the highest density of mobile phone subscriptions are the United Arab Emirates (232 subscriptions per 100 inhabitants),³ Montenegro (207), Cayman Islands (193), Macao, China (192) and Hong Kong, China (179). At the bottom of the list are the Marshall Islands (5), Eritrea (2), and Burma and Kiribati (1 subscription per 100 population). The country with the least density of mobile phone subscriptions is North Korea with .029 phones per 100 population. Figure 10.1 also reveals that since roughly 2006, the growth of mobile phones in the developed world is flattening out while in the developing world growth has been climbing more steeply. In other words, although countries that were early adopters of mobile phones, such as Iceland and Norway, have seen slow growth rates in recent years, societies in the Global South have become the main driving force for the diffusion of mobile phones worldwide.

In addition to diffusion, it is important to look also at manufacturing. In the past two or three years, the epicenter of mobile phone manufacturing, especially in terms of low-end grassroots innovation, has shifted away from industrialized Northern countries. China alone produced 619 million mobile phones in 2009, when its output accounted for 49.9% of the world market share (ifeng.com, 2010). Other Southern countries like India, Kenya, and Venezuela have also entered the mobile phone manufacture business in collaboration and/or competition with the Chinese manufacturers and with each other, using various innovation models that reflect their social reality but are very different from those of large Western and Japanese corporations. In order to find the answers to key questions, such as who invents the phone and how that innovation takes place and why, we need to shift our attention to the Global South, to countries like China, whose critical importance should be appreciated in terms not only of adoption and consumption but also of manufacturing and innovation.

Methods

This chapter is the result of data gathered through a variety of qualitative methods – ethnographic fieldwork, participant observation, and interviews in diverse contexts between 2006 and 2010. Participant observation among dozens of low-income mobile phone users and retailers was carried out extensively by two of the authors in Beijing, Guangzhou, and Shenzhen, China, for extended periods (2 to 10 months) throughout the duration of the research. Participant observation for briefer periods (two days to three weeks) was also conducted by all three authors among a variety of mobile phone retailers and low-income users in Antalya, Istanbul, Los Angeles, Houston, Manila, Bangalore, and Riyadh. In all of the above locations, as well as in Shanghai, Copenhagen, and London, over 40 interviews and numerous casual conversations were conducted with mobile phone retailers, in some cases with multiple followups.⁴ In-depth interviews with 12 mobile phone refurbishers were conducted in Shenzhen, Shanghai, and Beijing while in-depth interviews with three

mobile phone manufacturers and approximately 15 distributors were conducted in Guangzhou and Shenzhen.

The purpose of the interviews and observations was to gain an understanding of the types of alternative mobile handsets that have emerged in recent years as falling costs and flexible manufacturing techniques have led to an expanded mobile phone market. In addition, we sought to understand how ordinary users engage in various types of bricolage, or making do, as they appropriate mobile phones to suit their purposes. Our goal was to gather sufficient data that would allow us to generate preliminary taxonomies of, on the one hand, alternative, or flexible, mobile handsets, and, on the other hand, emergent grassroots practices among the information have-less. We also rely on mobile phone policy documents, mobile operator data from Bangladesh and Denmark, media reports, and research studies to supplement our own findings.

Alternative Phones and Grassroots Innovation

Alternative phones at the grassroots level emerge from a confluence of diverse social, economic, and cultural factors, but here we focus on three that are of particular relevance to our analysis: economic constraints, flexible manufacturing techniques, and what we refer to as “cultures of tinkering.” Although we separate them for analytical purposes, in reality they overlap and are mutually constitutive. In the following discussion, we briefly highlight how each of these plays a role in grassroots mobile innovation.

Economic Constraints

In the developed world, in most cases mobile operators offer customers discounted or “free” phones. In exchange for a subsidized handset, the user signs a contract – often for one or two years – and is “locked” onto a particular operator’s network, ensuring the operator a secure revenue stream for the period of the contract. When the contract time nears its end, the operator often offers a new handset to the individual in the hope that he or she will continue as a subscriber. Without a contract, users usually have more flexibility in choosing a new phone. However, “unlocked” phones, that is, phones not subsidized by the operator, are often far more expensive than “locked” phones. Still, there is an active “unlocking” industry that is readily available.

In many parts of the developing world, however, such contract arrangements are either nonexistent or are used only by the elite since they often entail not only having a certain level of income but also other requirements related to residency or bank accounts.⁵ Thus, finances obviously play a significant role in decisions regarding mobile phone adoption and types of use among those at the lower end of the socioeconomic

strata (Kalba, 2008; Zainudeen, Sivapragasam, de Silva, Iqbal, & Ratnadiwakara, 2007). Thus, a prepaid “top-up” system, with no regular monthly charge and where an individual buys a certain number of “minutes” that are used as needed, is preferred by millions of people. Given the irregular income of many people in the Global South, this type of subscription fits their needs better than a postpaid contract with a monthly bill. Kalba (2008) reports that in several countries as many as 92% of all subscriptions are prepaid. With the 2008 global economic downturn, prepaid phone cards have also become more popular in mature markets where postpaid, contract-based plans formerly dominated, as in the United States (Reardon, 2009).

The attention that “have-less” individuals give to pricing is not lost on mobile phone operators in emerging markets, who tend to offer a range of prepaid calling cards (including cards with bundles of text messages or wireless instant messaging service, or where the caller pays). Top-up cards can also come in very small denominations, for example only 50 cents (Ling & Donner, 2009).⁶

In addition, financial as well as technical constraints mean that users may often have several subscriptions, and thus several SIM cards. Indeed, this accounts for some of the double counting of mobile phone users described above. The users know that one subscription is cheaper during the day and another less expensive in the evening. They also know that one subscription may allow them coverage in one location, while a second subscription is better in another area. We have found that such “SIM switching,” as it is often called, is particularly common among Chinese rural migrants working in the service and manufacturing sectors in Shanghai and Guangdong along China’s coastal regions, where labor mobility is high.

Economics is also a factor in the manner in which mobile phone handsets are circulated. In major cities in both the developing and developed world, it is possible to find vendors selling used, reconditioned, and quasi-illicit phones. This is as true for Guangzhou and Mexico City as it is for Copenhagen and London, as will be discussed in more detail later in the chapter.

Flexible Manufacturing

In addition to micro-level economic issues, new modes of manufacturing at the level of entire industrial systems have given rise to the production of mobile handsets that fall outside the major global brands. The trend of flexible manufacturing can be traced back historically to the shift from Fordism to post-Fordism (or Toyotism) since the 1970s. As recently as a decade ago, in East Asia there was a clear division of labor in the flexible mode of manufacturing mobile phones, with Japanese corporations controlling research and development and reaping most of the profits, Taiwanese firms undertaking the actual manufacturing, and Hong Kong companies doing the marketing. However, in recent years this hierarchical relationship has been seriously eroded. Initially, Chinese and Korean firms started imitating the best-selling phones on the market. While their phones were inexpensive, their quality was also unreliable. Over

time these firms' emulation skills improved, and they started designing features that were unavailable on the brand-name phones, as in the case of *shanzhai* or bandit phones, which we will discuss shortly. These low-end phones, with improved reliability, more functions, and low price, then diffused quickly, both domestically and overseas, to claim, for instance, a quarter of China's huge mobile phone market (Su, 2009).

This latest trend of structural transformation in the flexibility of mobile phone manufacturing reflects the heightening of flexible capitalism since the turn of the century. The alternative mobile handset ecology can be understood, in this sense, as a crystallization of a new form of "network enterprise" beyond the original model identified in the Western context of the 1990s (Castells, 2000). This is not a coincidence because the traditional hierarchical model, as seen in the case of "locked" phones, is ultimately not "flexible" enough to meet the demands of both low-end consumers and the fiercely competitive mobile phone market. After all, the production cycle of mobile phones is quite short and some of the major manufacturers produce as many as 50 new (or somewhat modified) models a year. As new models hit the market, prices drop quickly. At the same time, low-end handset manufacturers need to make their products for a wide variety of have-less people. The restrictions imposed by mobile telecom operators and government regulators also tend to make the global brands less competitive by increasing their production costs and/or keeping them from adding attractive features such as the dual-SIM card design to facilitate the SIM switching discussed above.⁷

A prime example of this flexible mobile phone manufacturing can be found in the Pearl River Delta of China, bordering Hong Kong. For years this region, known as the "world's factory," has produced the vast majority of the world's apparel, electronics, and textiles. Its large number of factories and huge labor force made up of rural-to-urban migrants mean that production is quick and costs are cheap. By 2008 there were about 3,000 to 4,000 *shanzhai* mobile phone businesses in the Shenzhen Special Economic Zone alone (Farrar, 2009), making Shenzhen the world's *shanzhaiji* ("ji" meaning handset) production and marketing capital. The owners of many of these alternative mobile phone manufacturing facilities often have had prior experience working in joint ventures or local factories that subcontract with global brands to produce handsets and accessories, as do their workers. Yet they have left the mainstream and entered this newly emerging system of flexible manufacturing for a higher profit margin, faster returns, more room for technical innovation, and/or grassroots entrepreneurship.⁸ This indeed suggests a systematic change in the global division of labor for mobile phone manufacturing, with the epicenter of low-end design and production shifting decisively to places in the Global South like Shenzhen.

Cultures of Tinkering

A final factor that is constitutive of the rise of alternative handsets and grassroots mobile innovation is the practice of tinkering as a mode of cultural production

(Balsamo, 2011). Although “to tinker” can connote aimless toying or unskilled repair efforts, in reality tinkering can be done by experts and novices alike. To tinker is to explore and experiment with an object to fix it or to understand more fully its inner workings. As a form of innovation, tinkering involves creativity and is akin to bricolage in that it implies using whatever materials one has at hand. Tinkering means having a certain skill set, but more importantly a certain mindset; thus, it is often associated with a DIY, or do-it-yourself, ethos that informs everything from the punk to the hacker subcultures.

Because of its association with learning and creativity, tinkering has been increasingly embraced in the West as an important means of “cultivating the technological imagination” (Balsamo, 2011), and “tinkerability” is an intentional feature in certain software and programming languages designed for children (Resnick, 2007). Within a variety of grassroots movements formed around creating with one’s own hands, tinkering is also emphasized as a form of personal fulfillment, a way of emancipating production from the control of huge global manufacturers, and a means of forming community (e.g., *Make* magazine and Maker Faires in the United States).

While such Western-based domains of tinkering share some qualities with the cultures of tinkering that are the focus of our analysis, they also present some striking contrasts. Grassroots mobile innovation certainly derives from creativity, exploration, and bricolage, and there is no doubt that a hacker ethic informs some aspects of the alternative handset ecology, where there is often a clear disregard for intellectual property and a strong desire to open up the “black box” of technology to see what is inside. However, the key difference is that whereas in the West tinkering often informs leisure activities, in the Global South tinkering is more likely to arise out of necessity. Such tinkering is more akin to the self-reliant repair and maintenance that has been practiced for hundreds of years by people living in quasi-subsistence situations.⁹ While this work is seen as skilled in its local context, it is routinized repair work that is often linked to a system of receiving functional and broken handsets from either local customers or domestic or international suppliers, and then repairing them or perhaps selling them to a small retail outlet. In other words, it is labor – waged labor as opposed to the leisure interest often associated with hacking or open source software – and thus a means of feeding oneself and one’s family. It is this “subsistence tinkering” that stimulates grassroots innovation and informs the appropriation, manufacturing, and distribution of alternative mobile handsets.

A Taxonomy of Alternative Phones

In the following discussion, we put forward an initial taxonomy of grassroots handsets that have arisen out of the financial constraints, flexible manufacturing, and cultures of tinkering outlined above. This is a preliminary effort to map types of alternative or flexible phones and understand those who produce, consume, and

appropriate them based on our limited empirical observations. In theory there can be more types and, in reality, the various categories and actors overlap. This is not a fixed or exhaustive analysis, but we offer it so that we can begin to appreciate fully the scale and scope of the bottom-up mobile phone phenomenon worldwide.

Used Handsets – Kinship Networks, Technology Transfer, and Intermittent Entrepreneurship

Used phones form a large part of the alternative handset ecology in the Global South and circulate in a variety of ways. Research done in a number of different contexts in the developing world has found that it is common for family members to hand down phones to other family members once a new phone is purchased (Donner, 2009; Horst & Miller, 2006). Yet “handing down” is actually a misnomer since phones can circulate both up and down and back and forth. In some cases, used phones are passed from parent to child, such as in China when a young rural woman leaves home for the first time to find work in an urban area. Older siblings are also likely to pass phones down to a younger brother or sister. Although these two examples are representative of the guardian role of a parent or older sibling, it is also common that an adult child will pass a phone up to an elder parent. To again use China as an example, in both our fieldwork and that of others (cf. Oreglia, 2010), we have found that young adult rural migrants working in cities often pass along a used mobile phone to parents or siblings in the countryside (though some might buy a new one for parents as well). This facilitates communication but also can be seen as a form of technology transfer, given the vast rural–urban divide in China (Oreglia, 2010). Husbands also pass phones to wives, and occasionally phones are given by one friend to another. Among friends and family, used phones serve variously as a means of gifting, maintaining contact, and ensuring safety. The key points are that phones pass in multiple directions; such directions are often, but not always, dictated by familial obligations, age, and gender (females are more likely to have a used phone than males); and such passing along is not a finite occurrence: one phone can change hands three or even four times.

In addition to such exchanges that take place within kinship networks (and sometimes friendship networks), used phones have also become part of an informal, albeit often irregular, mobile economy. In this case, the transactions are also marked by a fluidity and flexibility not found in dominant models of exchange in the West: a shop and a street corner can equally serve as the locale for conducting business. In China, for example, where young, middle-class urban mobile phone users often purchase a new phone every 9 to 12 months (Rein, 2008), used phones easily find their way to the market, either through the owner pawning the phone to a second-hand shop or by an entrepreneurial trash collector, who secures additional income through hawking phones that have been discarded by others, as in Figure 10.2. Of course, the source of used phones can often be questionable, as mobile phone theft is a serious problem

Figure 10.2 A trash collector selling used phones on a street in Shenzhen, China. Photo: Cara Wallis, 2008.

in large cities such as Rio de Janeiro (de Souza e Silva, Sutko, Salis, & de Souza e Silva, 2011) and Beijing, where female migrants newly arrived from the countryside are often a prime target for rings of pickpockets.

This is not to say that in the developed world used mobile phones do not also circulate. They do, but on a much smaller scale. Interviews with shopkeepers selling used handsets in locales as diverse as Houston, London, and Copenhagen indicate that the phones largely come from local sources in a type of pawning arrangement. These shops often have an agreement with a nearby repair store that can recondition the phones and prepare them for reintroduction onto the market. However, these phones are not a significant part of the handsets that are on the mobile operator's network. The market for these phones is people who either want to cultivate a type of "retro" image or who wish simply to have an inexpensive phone, such as immigrant workers. In any case, the phones number in the hundreds on networks that have millions of handsets, indicating a much smaller market for these phones than in the developing world.

Whether they are passed along among family members, offered on an irregular basis by an enterprising worker finding opportunity in what others have discarded,

or sold in shops along with new phones, used handsets entail zero or minimal change to the actual device. We include them as a mode of appropriation because they are a means for technology to be in the hands of those who are not the intended users of such devices in the eyes of designers and marketers, and because they disrupt the “desirable” mode of consumption in a capitalist model of production that can only survive by inciting desire for the new. They are thus a mode of “reinterpretation” or “baroque” layering, whereby the used or discarded becomes a valuable channel of communication, an object embodying social relationships and obligations, and/or a means of irregular income.

Refurbished Phones – Apprentice Work in an Era of Mass Production

In developed countries, when a mobile phone breaks, in most cases it is thrown away, given to a charity, or put in a recycling bin. Most ordinary users do not know how to fix a broken phone, nor do they know of any business offering such services. A broken phone – once the initial frustration or disappointment has subsided – then offers an exciting opportunity to purchase a new phone. This is not necessarily the case in the Global South, however, where the financial constraints and the subsistence tinkering discussed earlier have led to the emergence of micro-entrepreneurs offering an array of services, including battery charging and phone repair, as shown in Figure 10.3.

Clearly, refurbished phones save low-income users money since they do not have to purchase a new phone if theirs breaks. What we wish to highlight, however, is that for those who can gain the requisite skills and equipment, phone refurbishing creates important employment and income-generating opportunities, which are crucial for those living at the margins of society. Furthermore, refurbishing sustains apprentice–novice relationships that are thought to have all but disappeared in countries that rely on large-scale manufacturing to produce their technologies. Moreover, shops offering such services support communities that are often isolated from the infrastructure that caters to those who are better off in society.

As an example, Xiao He, a 19-year-old rural-to-urban migrant from Henan province in China, had migrated to Guangzhou when he was 16. There he joined his parents, who rent a small cramped space in a migrant enclave (or “urban village”). The family lives upstairs while the downstairs area serves as a small pay phone business. For 20 months, until June 2008, Xiao He was an apprentice learning how to refurbish mobile phones. He was trained – while providing free labor – by a more experienced technician in a large workshop that consisted of dozens of mobile phone repair stands, most of which had at least one or two apprentices at any given time during our earlier fieldwork period from 2006 to 2008. After this training, he finally opened a mobile phone repair business inside his parents’ shop. His tools – mostly secondhand – consist of small screwdrivers, soldering equipment, electric dryers that

Figure 10.3 Mobile phone repair shop in Beijing, China. Photo: Cara Wallis, 2008.

soften plastic, devices to measure current, and so on. Xiao He is intimately acquainted with the motherboards of various types of handsets and is well versed in what might go wrong with a phone's numerous components. As a refurbisher, he engages in the subsistence tinkering we mentioned earlier, and he offers a vital service to those in his community.

In our fieldwork, we found that typically refurbishers are male, as in Xiao He's case, though in Beijing we met a young woman who had learned to do simple tasks, such as changing and charging batteries. This divide between jobs requiring "high" technical skill, and thus deemed appropriate for males, versus "practical" or unskilled jobs designated for females is common in low-level service work in China (Wallis, in press). That refurbishing phones is gendered masculine is also in line with broader ideas found in diverse cultures regarding the relationship between gender and technology.

Of course, aside from the gendered bodies that engage in repair work, a key aspect of mobile handset repair is access to parts and software. From a refurbisher's perspective, the fewer the number of phone types the better. If there are only a few types of handsets, spare parts can be cannibalized from older handsets and the software is more standard. To compare refurbished phones in the developing and

Figure 10.4 Distribution of the top 1,000 mobile phone handsets for a major operator in Bangladesh. *Source:* Adapted from data from Telenor.

developed world, one can take phones on the networks in Bangladesh versus Denmark. The material in Figure 10.4 shows the distribution of the top 1,000 mobile phone handsets for a major operator in Bangladesh.¹⁰ Nokia 1000 series phones make up about two-thirds of all these phones, as indicated by the dark shading. In considering all phones used in the Bangladeshi network, only about 15% are made by other manufacturers. When compared, for example, to the top 12 phones for an operator in Denmark, each of the top phones accounts for less than 1% of the total number of phones in Bangladesh. One phone, the Nokia 1200, represents twice as large a portion of the phones on the network as do the top 10 phones in Denmark.¹¹ What is surprising is that such a small set of phones dominates the market to the degree that it does. This type of “mono-culture” of mobile phones is an advantage for those who wish to reconstitute and rebuild handsets. The fact that there are so many of a small number of handsets means that there are always spare parts available. Indeed, this would encourage the culture of tinkering described above, while facilitating structural adjustment of the national mobile phone sector in Bangladesh from the bottom up.

Refurbished handsets, like the used phones discussed earlier, reveal how mobile phone users “make do” within the constraints of their lives. Rather than reinterpreting the device or engaging in baroque layering, however, refurbished phones could be seen as appropriation through “adaptation” or “creolization.” Certainly, opening up a phone to fix it violates the warranty agreement of all of the phones produced

by the global manufacturers. Furthermore, refurbishers often engage in creative bricolage or “creolization” as they mix parts and components to come up with a phone that is a hybrid mix, either inside or outside, or both. Through giving new life to a phone that would otherwise be discarded, intentionally or not they also reveal how mobile phones can be about sustainability, in contrast to the concerns raised by the escalation in electronics waste that has increased immeasurably since the widespread diffusion of mobile telephony – waste that often ends up dumped in the developing world.

Imitating and Innovating – *Shanzhaiji* (Bandit Phones)

In our next example, we focus not only on a type of handset that is appropriated by the information have-less, but also on an entire industrial system made up of producers, distributors, and end users. *Shanzhaiji*, or bandit phones, are one of the more interesting examples to emerge within the realm of flexible handsets and grassroots innovation. These phones are manufactured in and around Shenzhen, China, and are neither part of the black market nor fully legal. Instead, they constitute a gray zone within China’s burgeoning domestic mobile phone industry. They tend to be inexpensive and loaded with functions such as mp3 and mp4 players, televisions, radios, and dual SIM cards (for switching between two phone numbers). While bandit phones can mimic popular global brands in their design (and indeed can come in shrink-wrapped boxes),¹² the spelling of the brand name often intentionally betrays their bandit nature. For example, instead of Nokia, one can find Nckia; by the same logic, iPhone becomes Hiphone or iPheno. The more unique bandit phones are shaped like sports cars, rockets, cigarette packs, and even Doraemon and Mickey Mouse.

The information have-less are the prime market for *shanzhai* mobile phones. As we found in our fieldwork among young adult rural-to-urban migrant workers in Beijing, Guangzhou, and Shenzhen, bandit phones were commonly used precisely because of their low price and multiple functions. In brief conversations with *shanzhaiji* sellers in Shanghai, Guangzhou, and Shenzhen, many echoed such sentiments, stating that *shanzhaiji* were suitable to the needs of low-income users, both because of price and because they came equipped with such commonly used functions as QQ, an instant messaging, social networking, and gaming platform. As *shanzhai* phones spread, urban youth also began collecting them for their humorous or kitsch designs (Yang & Li, 2008). We could argue that marginalized youth were at the forefront of *shanzhai* appropriation, yet urban youth’s embrace of bandit phones emerges from a much different position of social power. Moreover, more mainstream, brand-conscious urban youth belittle migrants who use *shanzhai* phones, perceiving them to be striving for something they cannot attain (Zhou, 2010).

Given the diffusion of *shanzhai* phones among diverse users, they have become a serious competitor within China’s mobile phone market, constituting from 20 to

Figure 10.5 A mobile phone shop in Antalya, Turkey, offers dual SIM card phones. Photo: Cara Wallis, 2008.

25% of domestic phone sales (Barboza, 2009; Golden China Brands, 2008). By one estimate, China has produced about 200 million *shanzhaiji*, of which about half are sold within the country, and the bulk of the other half find their way into the Global South (Su, 2009). Bandit phones are exported to India, Africa, the Middle East, and Russia. They are also expanding to other markets; in our fieldwork we have seen *shanzhaiji* in Riyadh, Saudi Arabia, Manila, the Philippines, Antalya, Turkey (see Figure 10.5), and even Houston, Texas.

If we turn from users to producers, as with refurbished phones the *shanzhaiji* industry represents an example of grassroots innovation, albeit on a much larger scale, generating new functionalities (e.g., the dual SIM card) and a circuit of R&D personnel, producers, distributors, and retailers. This large-scale alternative phone praxis has produced a huge industrial system with its own logic (for a more detailed discussion, see Wallis & Qiu, 2012). The center of this system is made up of research and development teams, who work with providers such as MediaTek (MTK, the largest Taiwanese mobile phone motherboard maker) as well as channel companies that have a deeper understanding of market demands. To prepare the technical design of the phone, the R&D team gathers technical solutions and parts from these providers and channel companies. If necessary, other phone designs are copied, but the biggest concern is

controlling production costs. After the basic design is in place, manufacturers test a demo version of the phone, complete with hardware and software, and the product is then improved through multiple iterations. Once orders are commissioned, the manufacturer produces a large quantity of the *shanzhaiji*. Finished phones eventually go directly to wholesalers or reach the wholesaler via a channel company. Wholesalers then distribute the phones to retailers, who in turn sell them to customers.

The industrial system of *shanzhaiji* production has multiple phases, and each phase is extremely competitive, which forces everyone to focus on efficiency, reliability, and low cost as they seek to innovate new product lines, production processes, and software solutions. Companies making substandard products do exist, but they will be quickly discovered and marginalized in the *shanzhaiji* production system centered in Shenzhen. Although this is very much an informal economy system that relies solely on cash transactions, the people involved are also closely networked with each other.

Shanzhaiji producers thus reveal a reinterpretation of the typical mode of production maintained by the global brands. They have both reengineered the handset – adding formerly unheard-of functions like the dual SIM card – and have created an industrial system that efficiently caters to the needs of have-less users throughout the Global South.

Counterfeit Phones

Counterfeit phones make up the last type of grassroots handset in our taxonomy. These bear a resemblance to the *shanzhai* phones discussed above in terms of their production and distribution. The difference is that, unlike bandit phones that revel in their intentional bandit status, counterfeit phones try to pass themselves off as the real deal. Indeed, when the *shanzhaiji* industry started to take shape in China in about 2004, it was very much in the counterfeit business, using mostly Korean solutions to imitate Nokia models, for example. But since 2006, with the considerable profit made and the enhanced level of alternative R&D, many bandit factories have started to work on their own brands. A prime example is found in K-Touch (Tianyu), which has transformed from *shanzhaiji* maker to become one of the top-selling domestic brands in China. However, a large number of counterfeit phones are produced, including the iPhone, which is manufactured in Shenzhen (see Figure 10.6). This is because Apple had no formal business partner to distribute its popular handsets in China until August 2009, when it finally signed a deal with China Unicom.

But more commonly, counterfeit phones are made for rural markets not only in China but also in other Southern countries, where customers do not have sufficient knowledge to tell the fake from the real (one simple way is just to weigh the handset – counterfeits are usually much lighter). Many such counterfeit phones – as well as used and refurbished ones – go through Chungking Mansions, a residential and business complex in Hong Kong, for instance, which is right next to Shenzhen and open for male South Asian and African traders who cannot easily get into mainland China (Hong Kong has a much more

Figure 10.6 Counterfeit iPhones, iTouch, and iPads for sale in Shanghai. Photo: Cara Wallis, 2008.

relaxed visa policy). According to a West African trader, speaking with Gordon Mathews, an anthropologist who has been studying Chungking Mansions for several years, “When I carry phones back to my country, I mix them, real and fake. I sell the fakes to people off in villages, who don’t know any better. I sell the real ones to people I know” (Mathews, 2009, pp. 172–173). In our fieldwork in Guangzhou, we noticed several phone vendors who sold phones with French, Arabic, and English language capacity, but not Chinese. While some of these were legitimate domestic models made for export, others were labeled with name brands, and were clearly for export.

Counterfeit phones, in this sense, constitute one of the more problematic examples of alternative handsets. They can be viewed as appropriation through reinterpretation or cannibalization, not of the actual device itself but of intellectual property rights and ethical business practices. However, the counterfeiters and sellers often see themselves as simply trying to make do in the global flows of money, technology, and power that have relegated them to the margins.

Concluding Remarks

In this chapter we have provided an overview and critical examination of an alternative handset ecology consisting of flexible mobile phones and grassroots innovation

from the bottom up in the Global South. Basing our analysis in the user appropriation literature, we have introduced the basic patterns of alternative mobile handsets, including user characteristics and networks of relationships that influence the price, lifespan, and functionality of the phones, modes of flexible manufacturing that transform the mobile phone industry structurally, and the cultures of tinkering at the grassroots level. These converge to give rise to a diverse array of innovative modes of mobile phone production, appropriation, and consumption that often intersect with age, gender, and locality. We have brought together observations from around the world, though we have placed particular focus on China, to propose a taxonomy of alternative phones in the Global South, including used, refurbished, *shanzhai* (bandit), and counterfeit phones. Our analysis is only a first step in mapping what is undoubtedly a much broader alternative mobile handset culture that arises out of user necessity and ingenuity.

What are the most essential lessons learned from alternative mobile handsets and grassroots innovation in the Global South? First, this analysis provides new insight into the social shaping of technology. Drawing upon Eglash's (2004) and Bar et al.'s (2007) models of user appropriation, we have sought to disrupt the conventional perception of innovation as an exclusive privilege of elite individuals or big transnational corporations in Northern countries. Furthermore, we have argued for a broad notion of appropriation, which encompasses everything from sharing or resuscitating used phones, to modifying and remixing the handset, to technical innovations at the design, manufacturing, and distribution level. Grassroots practices that go against typical norms of capitalist consumption, traditions of technological mastery, and the creativity that goes into improving the business networks that enable mobile phone transactions locally, nationally, and transnationally can be found in many parts of the Global South. Our findings among the information have-less of China have also been noted in other developing countries, for instance, Morocco (Ilahiane & Sherry, 2008). These trends have been stimulated by, and will continue with, the further spread of mobile phones in the developing world.

Second, flexible mobile handsets and grassroots innovation are no longer small-scale, low-tech operations scattered outside the periphery of the modern industrial system of mobile phone manufacturing. On the contrary, they have moved into the center of that very industrial system, to a certain extent following the established path of flexible accumulation, but also pushing it to a new level of flexible manufacturing beyond the formal control of the multinationals and the intellectual property regimes. They operate on a huge scale, involving hundreds of millions of phones, if not billions, and in so doing they can generate rather sophisticated ways to improve both the technology and the business arrangements, as seen in the case of China's *shanzhai* phone sector.

Third and finally, grassroots innovation in the Global South happens in the stark reality of the developing world, where the majority of people struggle to survive on a daily basis. This cannot be more different from the mobile youth culture and DIY groups in Western societies, who engage in grassroots innovation for fun and for the expression of particular group identities. Instead, grassroots innovators in Southern

countries often are involved in alternative praxis because they have no other choice. Either they fix the phone and do it in the most affordable way, or they risk losing business in a fiercely competitive market, which could lead to more hardship or even starvation. It is therefore a form of “subsistence tinkering” that emerges from the bottom up, as a response to the existential issues of the Global South, where the forces of globalization constantly threaten to make more and more people “structurally irrelevant” in the network society (Castells, 2000, p. 436). Understanding alternative mobile phones in the developing world thus sheds light on these fundamental survival politics as well.

NOTES

- 1 We use “handset” to refer to the physical object that a person uses to place/receive calls and texts, or to access advanced services.
- 2 See “A Barack Obama branded mobile phone,” *Cellular-news* (2009, January 15). Retrieved from <http://www.cellular-news.com/story/35527.php>
- 3 We have pedantically been referring to the number of *subscriptions* per 100 persons, not subscribers. It would be absurd to claim that there are twice as many mobile phones in the United Arab Emirates as there are people. This discrepancy arises because often people have more than one subscription, especially in developing countries. Also, phone companies carry prepaid subscriptions on their books that may not actually be in use.
- 4 Obviously some of these cities are not in the Global South, yet a small market for used and reconstituted telephones still exists in these locations.
- 5 For example, in China many low-income migrants do not have a permanent, or relatively stable, mailing address – a requirement for such contract-based services.
- 6 Content providers as well tailor their offerings for low-income individuals. In Mexico and parts of the Southwest and Western United States, regional Mexican music – the music of choice for many working-class Mexican immigrants and their children – is downloaded not onto laptops but onto mobile phones in the form of songs and ringtones (Kun, 2009). According to our interviews with employees at Kongzhong, a popular content provider in China, games, ringtones, horoscopes, and the like are targeted specifically at segments of the information have-less, in particular college students and young adult migrant workers.
- 7 Mobile operators are often the strongest force against innovative designs such as dual-SIM cards because the flexibility they offer may mean less profit. Also, in countries like China, where the state plays a central role in setting rules for the mobile phone industry, brand-name manufacturers need to spend dearly on licensing their products, which adds to the cost of production and reduces the companies’ flexibility in the marketplace (see Wallis & Qiu, in press, for more details).
- 8 Although beyond the scope of this chapter, a “white label” phone manufacturing industry also exists that is somewhat similar to *shanzhaiji* production. For example, an operator, such as Vodafone, might wish to have a Vodafone branded handset that is not a Nokia, Motorola, etc. Thus, it turns to a “white label” manufacturer, often located in Asia, who

specifies the technical elements of the handset and inexpensively produces it in batches of several hundred thousands or a million.

- 9 The tinkerer certainly differs from the accredited, manufacturer-certified repairperson who has an employer-provided workspace as well as codes, specialized tools, and proprietary software that facilitate more fundamental access to the workings of the device. The tinkerer in our context could have some of these elements but in a limited capacity.
- 10 Through using the International Mobile Equipment Identity (IMEI) number it is possible to determine at any given point the number of a particular type of handset on an operator's net.
- 11 The top models in Denmark include the Sony Ericsson W890i, W595, C702, and K660i and the Nokia 6220, 6500, E51, 6230i, 5310, and 5500.
- 12 The shrink-wrapped boxes for *shanzhaiji* are usually nothing but another layer of emulation. Individual *shanzhaiji* are usually sold without a box. However, for a small sum the buyer can get it in a "shrink-wrapped box" that looks professional. Unlike the "authentic" box, however, the *shanzhaiji* box is always assembled with the phone put inside at the moment of purchase. It therefore is not wrapped in transparent plastic. Because of this last-minute assembly, usually in a rather chaotic environment, often the handset model information outside the box and the user manual inside do not match the *shanzhaiji* that has been purchased.

The End of James Cameron's Quiet Years

Charles R. Acland

ABSTRACT

In the years between his blockbuster films *Titanic* (1997) and *Avatar* (2009), James Cameron was an active documentary producer and director. Where many saw these years as a retreat from the mainstream of the film industry, this chapter argues that this period helped solidify his relationship with scientific discovery and the development of cinema technology. *Expedition: Bismarck* (2002), *Ghosts of the Abyss* (2003), and *Aliens of the Deep* (2005) are large-budget documentary films involving deep-sea expeditions, and in which the technology of physical and visual access to the subject matter figures prominently. This chapter demonstrates the thematic and aesthetic links these films have with *Avatar*. Cameron's persona as a technological auteur shows us how the business of film is bound up with a range of media products, new technological forms, in particular 3D film, and types of intellectual property, revealing the technological imperative lodged in conceptions of the future of cinema.

For many, James Cameron's groan-inducing "I'm king of the world" proclamation during the 1998 Academy Awards broadcast confirmed existing stories of his egomania. His outburst was part of his acceptance speech after winning the Best Director Oscar for *Titanic* (1997). Just imagine what he must have been thinking when he got up to accept the Best Picture award a few moments later! Though he was quoting a

line of dialogue he had written for the film, Cameron's triumphant declaration made his status as a less-than-beloved figure, especially among people who had worked for him, evident to a wide television audience. A few weeks after the Academy Awards, Peter Bart wrote an April Fool's editorial in *Variety* that parodied Cameron's megalomania, saying executives had to rent Chasen's Restaurant just to take a meeting with him, that Cameron insisted no fewer than four studios would be required to back his next project, and that he asked to be addressed as King, beginning all meetings with a few minutes' silence for the victims of the *Titanic* (Bart, 1998). But for all of his grandiose behavior, imagined or otherwise, let us remember that just prior to *Titanic*'s release, the film and Cameron were widely ridiculed, with high expectations that his film would be a colossal failure. The production, the financing, and the releasing strategies were so outside industry standards at that time that it was difficult for observers to understand his plan. So, that evening at the Academy Awards ceremony, he had reason to gloat.¹

The pre-release miscalculation about *Titanic* led many critics and industry analysts to take a "wait and see" attitude toward his more audacious sci-fi project *Avatar* (2009). Cameron wrote, produced, and directed that unparalleled expensive 3D production; he also did uncredited work as director of photography and provided hands-on contributions for virtually every aspect of the production. Critics reserved judgment on what appeared to be a fundamentally insupportable business model, even when some sneak peaks at footage left fans underwhelmed. And once *Avatar*'s record-breaking box-office returns began to roll in, it was clear that this was a prudent decision.

Concerning the years between Cameron's career peak in 1998 and the release of *Avatar*, an impression circulated that he was not making movies. For instance, *Variety* titled a brief 2001 update on his career "*Titanic* titan takes time out" (Hayes, 2001, p. 4). During that time, though, his status as an elusive craftsman and perfectionist never rested; indeed, it expanded even though he was absent from the annual blockbuster slate for over a decade. Despite his enigmatic, and counterintuitive, career path, he remained popularly understood as a decisive creative force. His cameo in the *émission à clef*, HBO's *Entourage*, had Cameron playing himself and signing the heartthrob character Vinnie Chase to star in *Aquaman*, a fictional project that seemed to be a plausible Cameron pursuit: he has made water-set action epics and worked to launch the *Spiderman* franchise before being supplanted. In a telling moment, Cameron notifies the actor of his casting decision via a cell phone call while piloting a helicopter. The image of the powerful filmmaker, directing the players from on high, propellers churning in the background, matches the sense that Cameron is rather like a remote and technologically savvy military commander. As Turtle, a member of the show's eponymous entourage, says, "With Cameron directing, you know it's going to be special." This reputation persisted, and his fan base was strong, despite the fact that most assume he had made only six films in the 25 years following his breakthrough movie, *Terminator* (1984). That's roughly the same rate of production as his self-declared creative mentor, and painstakingly slow filmmaker, Stanley Kubrick, from *Spartacus* (1960) to *Eyes Wide Shut* (1999).

In actuality, Cameron was an active filmmaker during the years between *Titanic* and *Avatar*, working as a documentary producer and director as well as a television producer (Fox's *Dark Angel*), and he did so in his outsized way. His documentary turn was unusual for this committed sci-fi action director, to say the least. He was executive producer of several controversial made-for-cable documentaries, most notably the revisionist biblical subjects of *The Exodus Decoded* (2006) and *The Lost Tomb of Jesus* (2007), both directed by Emmy Award-winning documentarian Simcha Jacobovici, who has since gone on to star in the VisionTV and History Channel series *The Naked Archeologist*. Cameron's own directed and produced documentaries are *Expedition: Bismarck* (2002), which he co-directed with Gary Johnstone, *Ghosts of the Abyss* (2003), and *Aliens of the Deep* (2005). The latter was co-directed with Steven Quale who, incidentally, went on to be a second unit director on *Avatar*.

These three Cameron films are large-budget science documentaries involving remote undersea settings. In fact, some claim *Aliens of the Deep*, which included a \$14 million dollar expedition, is the most expensive documentary ever made (MacInnis, 2004, p. 27). His penchant for quoting himself reappears in these titles, two of which allude to his features *Aliens* (1986) and *The Abyss* (1989). Beyond these references, the links between these documentaries and his blockbusters are manifold and substantial enough that we should not see them as the radical departure from his oeuvre that they might at first appear to be. In fact, in many ways, this trilogy solidified Cameron's relationship to ideas about popular science, exploration, and technological innovation. Indeed, his success in building a persona that embodied these traits is such that in 2006, with *Titanic* nine years in the past, and with *Avatar* still called *Project 880*, Cameron received the Visionary Award from Cinema Expo, the exhibitors' convention, for his special contribution to technological innovation (Pickard, 2006, p. A6). Two years earlier, he received the Nicola Tesla Award in Recognition for Visionary Achievements in the World of Digital Technology and Sound from the Satellite Awards. Meanwhile, an honorary doctorate from the University of Southampton for his contribution to maritime science and his membership on the NASA Advisory Council marked the degree of recognition he held among scientists. Take note that these industry and scholarly recognitions transpired at the time of his supposed hiatus.

Cameron doesn't do anything quietly, and his years of retreat from the mainstream of the Hollywood industry involved some grand exploits. His surprising activity over the 12 years following *Titanic* tells us something about the state of financial control, technological innovation, market development in the international film business, and relations among film and other media. This period of his career offers a case in which we can explore what exactly this thing is we call the film business. The first step is to know that there is no easy definition, and that there is no unified and stable entity called "the film business." Tom Schatz (2008) has described the current phase of film history as the era of "Conglomerate Hollywood," characterized by film's diminishing revenue-generating centrality inside a maze of vertically and horizontally integrated business concerns. Eileen Meehan (2008) has shown that the varying

corporate structures of “the Big Six” – Disney, General Electric, National Amusements, News Corporation, Sony, and Time Warner – reveal nonsynchronous relations between entertainment sectors, hence differing approaches to industrial strategy. In short, what we refer to casually as Hollywood is in fact a configuration of different industries, agendas, strategies, and commodities, which can interlock and promote one another or can be countervailing forces.

In a media system noted for its sprawling and unwieldy character, Cameron stands out as one who succeeds – commercially and, in some quarters, critically – where prevailing logic suggests he shouldn’t. With each film, Cameron and his collaborators systematically worked through problems and possibilities for certain kinds of special filmmaking conditions, special exhibition contexts, and business strategies. Significantly, and this is what I investigate in this chapter, in his projects and persona we can identify the technological imperative lodged in conceptions of the future of cinema. He displays a certain *technological auteurism*, especially in the popular and industrial representation of his credited innovations. As *Variety*’s Peter Debruge (2006) wrote of Cameron, “When ‘the King of the World’ sets his sights on tomorrow’s technology, the rest of the industry takes note” (p. A1). Through Cameron, we can begin to discern the meaning and implications of “technological achievement” for an industry that devotes a considerable amount of investment in the notion. The Academy Awards for technological accomplishment tend to be sectioned off from the primary broadcast, relegated, at best, to a few minutes’ recap of an earlier highly gendered ceremony with an attractive starlet doling out statues to geeky men. In actuality, this dimension of corporate competition for proprietary control over the advancement in moving image technologies is a major feature of the entertainment industry. By linking Cameron’s blockbusters with his documentaries, and by focusing on production and exhibition technology, this chapter shows how certain unstable technological aspects of the film industry have been carefully capitalized upon by Cameron. In a sense, he is an idol of the digital future of cinema. This especially involves his commitment to 3D film and to the development of 3D filmmaking processes. Even though such processes have a long history and are associated with countless innovators, Cameron has been elevated as a vanguard enthusiast for the technological and economic viability of contemporary 3D. To establish his current status as a technological auteur, we begin with the reception of *Avatar* and its use of 3D.

***Avatar* as Game Changer**

The jokes about *Avatar* were almost as good as the movie: Pocahontas meets Halo, Dances with Wolves in Space, James Cameron’s Ferngully, and a recruiting vehicle for Blue Man Group. With the film’s juggernaut rollout, such humorous spins were to be expected. But it is one thing to put the promotional engine in high gear, and

another to deliver a financially successful, audience-pleasing, and critically respected film to match the hype. By virtually every measure, Cameron did exactly that with his body-swapping, environmentally aware space opera. *Avatar* enjoyed a high cumulative score on the omnibus movie review website Rotten Tomatoes. And audience interest bulked up the film's box office to \$750 million domestic, and \$2.73 billion worldwide, making it (arguably) the highest-grossing film of all time.

Avatar was a "tentpole" film, which means it was the centerpiece of distributor Twentieth Century Fox's slate of recent releases. There is no hard and fast definition for what counts, but tentpoles typically have large budgets, especially for promotion, and might be expected to launch or continue a film franchise. A major distributor may have a couple of tentpole films over the course of a year. Such films are often mentioned in the annual reports of media corporations, as distributors temporarily bank corporate fiscal health on the success of those particular releases. With tentpoles drawing the largest theatrical audiences, a distributor fills out its "tent" with films that might be directed toward genre or niche audiences. For exhibitors, a tentpole benefits simultaneously released films, as, say, parents drop off their kids to see *Avatar* and then take in *It's Complicated* (Nancy Meyers, 2009) on the screen next door.

But *Avatar* was also something of a different order. It may be a case of absence making the heart grow fonder, but the lead up to *Avatar*'s release date – itself a commemorative or superstitious marking of *Titanic*'s release date 12 years earlier – was extraordinary in a number of respects. Online ticket vendors MovieTickets.com and Fandango both started selling tickets in August, an unprecedented four months before the release ("Are James Cameron fans the type," 2009). Cameron enjoyed a substantial amount of media attention through the fall of 2009, with profiles of his career and the technological innovations of *Avatar* characterizing him as a "man of extremes" who did not let the mundane fiscal realities of a production budget hamper the final product. But these profiles also carefully crafted a kinder, gentler, blue-collar hero whose advancement was the product of ingenuity, hard work, and a faith in scientific discovery.²

An air of secrecy around the film's production helped build public anticipation. Entertainment news greeted the release of individual photographs from the set and film stills as being just as newsworthy as paparazzi shots of inebriated stars. But a tone of reverence was evident in some of this entertainment journalism, making the publicity photos seem like images of an actual far-flung space station or scientific expedition.³ The availability of a three-minute trailer for *Avatar* online and in theaters was conventional marketing material. A new trailer premiered on an episode of Fox's *House, M.D.* (November 16, 2009), with advertisements for the trailer broadcast through the preceding week. Close connections to the gaming industry were sought; Ubisoft developed a 3D *Avatar* game, released on December 1, 2009, just weeks ahead of the film itself.⁴ Not surprisingly, the trailers for the movie and for the game were easily confused, and indeed, this was part of the point. But the decision to show 25 minutes of the film in Amsterdam at the exhibitors' convention CineExpo in June, then in Los Angeles at a gathering of 2,000 US exhibitors at Grauman's Chinese

Theatre, and then at the US comic book and science fiction convention Comic-Con in July in San Diego, was all part of an atypical rollout strategy. The lead-up to the release additionally included surprise clips and a panel discussion at the videogame conference E3 in Los Angeles and a free showing of 16 minutes on 100 IMAX 3D screens on August 21, 2009 (McClintock, 2009). Such limited access to a portion of a highly anticipated film generated a sense of scarcity and word-of-mouth publicity. But these were very risky decisions, for reviews, especially on increasingly influential web-based fan sites, were not uniformly positive.

The most unusual aspect of the months prior to release was the way *Avatar* was talked about as a revolutionary shift in cinema. Few media products have such elevated expectations as *Avatar* had attributed to it. And these expectations were not only for its own success, but also for a number of other products and technologies it bundled to share its revenue-generating glory. Many believed that this film was a game changer for the business of cinema. Steven Soderbergh was one unlikely auteurist voice singing the praises of *Avatar* based on partial footage he had seen during the production process. He went so far as to describe it as a “benchmark” movie, comparable to *The Godfather* (Francis Ford Coppola, 1972) in its day.⁵ Similarly, DreamWorks Animation head Jeffrey Katzenberg asserted, “I think the day after Jim Cameron’s movie comes out, it’s a new world” (quoted in Goodyear, 2009, p. 67). At the film’s premier, director Michael Mann declared, “There’s before this movie and after this movie” (Higgins, 2009).

The language of the “game-changing” impact of *Avatar* is illuminating. First, the film represented stupendous budget aggrandizement and ever more Byzantine accounting procedures. The official budget from Fox and Cameron’s production company, Lightstorm Entertainment, was \$230 million, up from the initial budget of “close to \$200 million” when Fox’s participation was first announced in January 2007 (Waxman, 2007). So unrestrained was Cameron that that amount soon seemed like a bargain next to unofficial estimates. Once we add all international distribution and marketing expenses, and the personal financial commitment of individual investors, including Cameron, the figure is closer to \$500 million (Cieply, 2009). That outlandish figure was not the worrisome feature for the distributing studio Fox that one might expect, due to the fact that it limited its liability. Dune Entertainment and Ingenious Media, two private equity partners, were reportedly in for roughly 60% of the budget (Cieply, 2009). That *Avatar*’s grosses rapidly surpassed its record-breaking budget gave industry investors confidence in the financial viability of the top end of the budget food chain. Take note that a parallel 2009 Hollywood success story was that of *Paranormal Activity* (Oren Peli, 2009), a \$15,000 movie that made over \$100 million in domestic release. These two films thus laid out two contrasting contemporary blockbuster economies.

The trade and popular press coverage of Cameron’s production unfailingly emphasized the intricacy of the technological requirements of the film as part of its “game-changing” status. Trade publications faithfully repeated that Cameron had sketched the idea for *Avatar* in the mid-1990s, but the technology needed to realize

his vision was, according to Cameron, “not advanced enough” (Rampton, 2006, p. 14). He had to wait for the technology to “catch up” to his vision (Snyder & LaPorte, 2007). Frequent mentions of how long this project gestated presented *Avatar* as the product of a devoted artist. As the story goes, Cameron was so singularly driven by his original vision for the film that he was willing to wait until the cinematic technology matched his imagination, or he simply and impatiently initiated the innovations himself. Cameron, in this representation, essentially willed the future of cinema into being. The trade press emphasized that Cameron was, in a sense, making a movie for a cinematic apparatus that did not yet exist, something that had been suggested at other points in his career, especially related to the groundbreaking CGI in *The Abyss* and *Terminator 2: Judgment Day* (1992).⁶

Trade pundits and cultural commentators most frequently discussed *Avatar*'s game-changer status in relation to 3D exhibition. He began production of the film at a time when the conversion of cinemas to digital exhibition – a vast international endeavor to replace traditional celluloid projectors in movie theaters with digital ones – had slowed. Digital theaters were going to be an essential aspect of the film's success, as it required the new 3D digital projection for which only a fraction of existing digital screens had been equipped. There was a level of blind faith on Cameron's part that the screens would be there by the time he released his film. By April 2009, there were merely 2,000 3D-ready digital screens in the United States, representing just over 5% of all screens (Cohen, 2009). The risk inherent in such a form of production was being offset by plans to release regular 2D versions of the film as well.

Such devotion to a future cinematic era does not always work out. A relatively recent example of such a commitment to a specific vision of technological change was George Lucas's declaration that he would release *Star Wars Part I: The Phantom Menace* (1999) exclusively for digital exhibition. At the time, he was confident there would be a speedy conversion to hard drives and digital projectors from film reels and celluloid, and doubly confident that his film was so attractive to exhibitors and audiences alike that it would actually encourage that conversion. This, of course, did not come to pass for a variety of reasons, including underdeveloped technical standards, shaky security, and a lack of coordination between exhibitors and distributors for the expense of digital conversion, as well as the dire financial straits of exhibitors at that time.

Cameron saw *Avatar* as an engine that would push the 3D technological shift, as much as he and Fox expected to benefit from it, and eventually an influential segment of the industry would agree. A significant difference from Lucas's 1999 effort was that the financial and technical coordination for digital exhibition had been resolved, largely through the work of the industry consortium Digital Cinema Initiatives (DCI). And the exhibition industry was relatively sound, with the 2009 domestic box-office receipts set to be a record at over \$10 billion *before Avatar*'s December release. Moreover, the advanced word on the film itself was strikingly positive – those tepid online fan reviews of select film segments notwithstanding – something that *The Phantom Menace* did not enjoy.

A certain industrial agreement had been in process that 3D was the next phase in cinema technology history. When an opinion piece in the *Los Angeles Times*, by Patrick Goldstein, derided the rush to 3D, Katzenberg responded in *Variety* to reaffirm the celebration of 3D technologies and to chastise Goldstein for being a Luddite. As with the turn to color, Katzenberg (2008) reasoned, 3D will eventually be recognized and exploited for its artful potential. His drum-banging was in part shilling for his 3D DreamWorks Animation SKG releases *Monsters vs. Aliens* (Rob Letterman and Conrad Vernon, 2009) and *Shrek Forever After* (Mike Mitchell, 2010). But he did represent a high level of faith in the general economic viability of this transition. And *Avatar* figured prominently in this cheerleading for 3D. *Time* concluded its feature on 3D describing *Avatar* as a vanguard example of the future of the format (Quittner, 2009). Michael Lewis, head of the leading 3D exhibition outfit RealD, predictably concurred, saying, “the industry is looking for its *Citizen Kane*, its definitive work of 3D, and *Avatar* may be that film” (quoted in Goodyear, 2009, p. 67). Versions of this line had been repeated by this company for several years, a view that gently pushed the responsibility for the conversion to digital 3D, in particular their proprietary system for 3D, back on filmmakers who were yet to have made an art of the form. Joshua Green, co-founder of RealD, said in 2005, “We still haven’t seen the *Citizen Kane* of 3D” (quoted in Merritt, 2005, p. 13). By 2009, his business partner Lewis reiterated, “*Avatar* is potentially the *Citizen Kane* of this medium” (Browning, 2009).

The seizing of milestone moments is one way in which technological change is made comprehensible and inevitable. Investment analyst Lloyd Walmsley, for instance, predicted that “3D stands to reestablish the ‘experience premium’ of movie-going. It’s a game changer” (Huggins, 2008, p. 25). Trade reports conventionally linked this phase of 3D with the short-lived fad of the 1950s, but went on to cite other lasting changes, like the variety of widescreen processes of the same period, as more relevant comparisons for this exhibition innovation (Bing, 2005). Michael Lewis maintained that 3D is “the killer app of digital. As more and more of these films come out and we see them perform well, there’s going to be an even bigger push to get more [digital] screens out there” (quoted in Debruge, 2007, p. A6). The subtitle of *Variety*’s supplement on Cinema Expo and 3D in summer 2008 was “the killer app” (Cinema Expo/3D, 2008, p. A1). Thus 3D exhibition, which had proven lucrative for animated features over the years just prior to *Avatar*, was being taken as a driving force for the acceleration of the conversion of theaters to digital exhibition. In this understanding, *Avatar*’s influence extended beyond 3D to the speeding up of the obsolescence of celluloid projectors (Huggins, 2008, p. 25).⁷

The “game-changing” hyperbole was manifest in other aspects of the *Avatar* commodity world. Game developer Ubisoft’s 3D *Avatar* game prompted *Variety* to wonder, in a rather weak pun, whether or not it was “A Game Changer?” (Morris, 2009, p. 4). Ubisoft had been seeking increased involvement in the feature film business, acquiring prestige CGI company Hybride, based in St. Sauveur, Quebec. A further complication to the lines between entertainment industries, Cameron contracted Hybride to do effects for *Avatar*, the movie. Panasonic used *Avatar* in an international cross-

promotion deal to sell its own new HD 3D Home Theater system.⁸ This push linked to the gaming industry, as *Avatar: The Game* required a 3D-enabled television or monitor in order for the full 3D design of the game to work. But it also looked ahead to 3D television programming. Accordingly, immediately following *Avatar*'s apparent box-office success, several television channels announced plans for conversion to 3D broadcasting.

To see how Cameron became an industrial avatar in the technological revolution of digital and 3D cinema, we must look at a period of time generally thought to be his "quiet years."

Battle Across Formats

Cameron's first foray into 3D was with *T2-3D: Battle Across Time* (1996), made for Universal Studios Theme Parks. This theme park attraction, based on *Terminator 2*, includes a mixture of live action and a 12-minute multiple-screen film. *T2-3D* extends the action enough to be considered – by Cameron, at any rate – a miniature sequel. The film portion features *Terminator 2* cast members Edward Furlong, Linda Hamilton, Robert Patrick, and Arnold Schwarzenegger. At \$62 million, some have claimed it is the most expensive per-minute cost of a film to date. It is difficult to assess the profitability of this kind of attraction, but its longevity lends some justification to this investment, and the exhibit continues to play at Universal theme parks in Florida, California, and Japan.

T2-3D was made with the involvement of Digital Domain, a company Cameron started with special effects expert Stan Winston and Steve Ross from Industrial Light & Magic (ILM), along with a 50% equity stake from IBM, in 1993. They intended the enterprise to be an artist-centered special effects shop all under one roof (contra the mish-mash of boutique companies that made up ILM). That one location is a Frank Gehry-designed retrofitted warehouse in Venice, California, over which the self-described Hollywood renegades fly the Jolly Roger. No pirates ever enjoyed such comfortable digs. Cameron did plunder, literally, the resources of Digital Domain to such an extraordinary extent for the making of *Titanic* that he almost ran the company into the ground, departing acrimoniously from the board of directors in 1998, though he maintained minority ownership. His parting words to the board were reportedly those of the musicians on the sinking *Titanic*: "Gentlemen, it's been an honor and a privilege playing with you" (Lubove, 2005, p. 161).

The company did not sink; just the opposite. While Digital Domain's work on such films as *Fight Club* (David Fincher, 1999), *Apollo 13* (Ron Howard, 1995), and *X-Men* (Bryan Singer, 2000) garners most of the praise lavished on the company, it handles roughly three or four films a year. By way of contrast, it does approximately 80 commercials annually. As a result, projects other than features are usually the first testing ground for new software and effects (Bizony, 2001, p. 10). These smaller works

become a point of initiation for new processes, digital and otherwise, only to be highlighted for popular entertainment audiences in subsequent films. It follows that in order to properly account for the development of new cinematic processes, techniques, and software, we must attend to the industry's full range of audiovisual production, eschewing a narrow focus upon feature fiction. Accordingly, with *Digital Domain*, a first turn for Cameron toward his current interest in 3D was not with a feature film or a documentary but with a theme park exhibit.

While *Digital Domain* worked on the 3D CGI effects for *T2-3D*, the challenges of shooting in 3D included the sheer weight of the dual 65mm camera unit, which at 450 pounds required a specially constructed cable system to suspend and move the unit during the long motorcycle chase sequence that is the centerpiece of the 12-minute film. Cameron, and his cinematographer Russell Carpenter, who also shot *Titanic*, learned – as anyone shooting 3D realizes – that getting the exact focal-length for the point of convergence of the two cameras, and hence our two eyes, was key to reducing eye-strain, as well as establishing the best 3D effect. Crudely put, in order to be able to cut between an establishing shot and a close-up, you have to change the point at which the audience will focus their eyes, and having a camera system that allows the director and director of photography to do this easily is extremely valuable to 3D filmmakers. This, and the weight of the double-camera unit, became the primary issues addressed by the systems he would later help develop. Additionally, slight differences in positions of frames on each of the two projectors used at the 3D screenings can ruin the depth effect. This was solved by increasing the frames per second from 24 to 30 for both shooting and projection (Bizony, 2001, pp. 221–222). More broadly, Cameron became an active campaigner for increasing the accepted standard of all frame rates above 24 fps (Cohen, 2005, p. 7). He challenged the new standards for digital projection because they addressed pixels but not frame rate, believing the ideal format would be 3d/2k/48fps (Cohen, 2008). The faster frame rate for the *T2-3D* shoot, in turn, necessitated an extraordinarily bright shooting environment, and unusual power demands to light the set.

So elaborate, and expensive, was the production of this attraction, and so unusual the involvement of such high-profile Hollywood figures, that *Variety* reviewed *T2-3D*'s opening as though it were a film. While most of the review recounts the narrative setup for the blended live-action/3D film performance, there was much reverence for the technical accomplishment. Reviewer Joe Leydon wrote, "The 3D cinematography and special-effects handiwork are nothing short of astonishing" and "everything about this enterprise has been meticulously thought out and cleverly executed" (Leydon, 1996, p. 82).

After *Titanic*'s release, and following the accolades for that film's technical achievement, especially the integration of CGI with conventional photography in what appeared at the time to be a seamless fashion, Cameron committed to 3D as a fulfillment of the cinema's promise of totalizing sensory involvement, despite the generally unsatisfying experience shooting *T2-3D*. His ethos as a filmmaker involves popular forms of pleasure via the action/romance genre, which include unfamiliar images

(the liquid Terminator in *T2*), surprising leaps from the intimate to the destructive (the “I’ll be back” sequence in *Terminator*), and powerful and prominent female leads.⁹ Cameron’s action set-pieces typically involve locating the view at the heart of the sequence – in the cab of the truck or police cruiser racing away from a pursuing cyborg, among the soldiers running from aliens, and inside a flooding submersible. In this way, the potential of 3D as a “new” popular action experience met its equal potential to extend the sensation of being surrounded and engulfed by images, as emphasized in many of Cameron’s films. Indeed, the centrality of immersion to the cinematic experience is arguably something Cameron has implicitly grasped well, offering underwater and sci-fi sets that nestle, or claustrophobically entomb, characters and viewers alike.

But as a maker of popular plot-driven entertainments, Cameron is also on record as understanding the limits of immersion, believing that IMAX screens are too large and allow for too much wandering of the eye on the part of the spectator to work for strongly narrative forms. His approach to 3D is to direct the eye, and to guide the viewer through the narrative experience (Debruge, 2006, p. A6). Contra claims that *Citizen Kane*’s extensive use of deep-focus cinematography is a good model for 3D shooting, Cameron said,

I find the opposite is true. Selective focus, created by working at low f-stops with longer lenses, evolved as a cinematic technique to direct the audience’s attention to the character of greatest narrative importance at any given moment. With 3D, the director needs to lead the audience’s eye, not let it roam around the screen to areas which are not converged. So all the usual cinematic techniques of selective focus, separation lighting, composition, etc., that one would use in a 2D film to direct the eye to the subject of interest, still apply, and are perhaps even more important. (Cohen, 2008)

In addition to an aesthetic and thematic overlap, it is also noteworthy that in our era of economic tilt toward home theater systems, Cameron’s 3D projects – which continue with writing and directing two *Avatar* sequels and *Battle Angel* (pre-production, 2016) as well as producing *Sanctum* (Alister Grierson, 2011) – display remarkable faith in theatergoing. Though the bulk of revenue can still be expected to flow from ancillary windows, he makes these films for theatrical exhibition and for the newest iterations of theatrical digital projection.

Two of his documentaries, *Ghosts of the Abyss* and *Aliens of the Deep*, were shot for exhibition in IMAX 3D, though these were not shot with the IMAX camera system. The opening sequence of *Titanic* includes a dive to the wreck, led by Bill Paxton’s character. This sequence serves as a framing device for the story and introduces the film’s MacGuffin – the Heart of the Ocean diamond necklace. This opening was the product of an actual dive, though Digital Domain “improved” that footage later. Cameron returned to the sunken wreck, with Bill Paxton, to shoot *Ghosts of the Abyss* in 2001. That time the shoot included a 26-pound lightweight 3D HD camera developed by Vince Pace, called the Reality Camera System (RCS), and two smaller remote

control vehicles carrying standard video cameras, anthropomorphized as Jake and Elwood, named after the lead characters in *The Blues Brothers* (John Landis, 1980). Vince Pace is an underwater film expert and had worked with Cameron on *The Abyss* and *Titanic*. The expedition included another documentary filmed by Russian crew members and an Internet webcast of the descent, with the Buckminster Fuller-esque title *EarthShip.tv*, supervised by Cameron's brother JD. The other familial connection was brother Mike, an engineer who designed the deep-sea casings for the cameras. Such a thoroughly recorded event, not surprisingly, involved many cameras, including small "lipstick" cameras inside the diving capsules. The final result did not impress reviewers, though they remained taken with the 3D effect. Tim Cogshell (2003) wrote for the exhibitor trade *Boxoffice*, "*Ghosts of the Abyss* can be too jokey and often outright silly with an overwrought sense of drama. But it's fascinating, especially in 3D" (p. 60).

Expedition: Bismarck, which chronicles a dive to the famous sunken Nazi battleship, was shot with the same 3D system, two remote control cameras, and other cameras, though broadcast on Discovery Channel in the more familiar dimension of 2D (McKay, 2002, p. 37). As in *Ghosts of the Abyss*, this film too uses computer graphics and reenactments to supplement the raw data of the wreck with speculative accounts of how the ship sank. It was filmed after *Ghosts of the Abyss*, in 2002, but Discovery broadcast it the same year, prior to the opening of the IMAX 3D film, making *Bismarck* Cameron's first documentary release. For their efforts, they received five Emmy nominations, winning one.

Aliens of the Deep documents several dives in both the Atlantic and Pacific Oceans, but centers on a journey to the so-called Lost City, a deep-sea location with a unique ecosystem of creatures that live without light around hydrothermal vents of 350 degrees Fahrenheit. For this film, he used these same 3D cameras, though he and Pace had modified their RCS system to improve things like the zoom, which they put to effective use to record close-ups of some bizarre and relatively unknown creatures, including one they call, and likely is, "the ugliest fish in the sea" (Calhoun, 2005, p. 61). Nonetheless, an otherwise skeptical review by Jonathan Barnes in *Sight & Sound* still confesses the film's 3D experience elicits both "childish delight" and fright, with giant sea creatures "out of H. P. Lovecraft's most inventive nightmares" (Barnes, 2003, p. 40).

Following the *Aliens of the Deep* shoot, Cameron and Pace built the next generation of the camera, now called the Pace/Cameron Fusion System, which allowed for easier changing of the point of convergence between the two cameras for 3D shooting. Other differences from the earlier RCS include faster response time, lighter weight at 22 pounds, and better accommodation of sound (Hurwitz, 2009). Cameron, Pace, and Patrick Campbell (president of Pace and a camera assistant on *Ghosts*) received the patent for their system, a "platform for stereoscopic image acquisition" (7,643,748, filed June 2, 2006, received January 5, 2010) and one for "stereo camera with automatic control of interocular distance" (7,899,321 B2, filed October 13, 2009, received March 1, 2011). Versions of this camera system were used to shoot the live-

action sequences of *Avatar* as well as concert films for U2, the Jonas Brothers, and Miley Cyrus, and features including *Final Destination 3D* (David R. Ellis, 2009) and *Journey to the Center of the Earth* (Eric Brevig, 2008). In terms of wider market development, they claim to have the largest inventory of such 3D units (Hurwitz, 2009, p. 32), which puts Pace (the company) and Cameron et al. (the patent-holders) in an advantageous position as the making of 3D movies grows, against competing 3D camera rigs like Element Technica, Binocle, and P+S Technik.

In April 2011, Pace the company was rebranded as the Cameron-Pace Group to offer a full range of 3D products for feature films and for television, sports, commercials, and other specialty events (Giardina, 2011). Along with their Fusion camera system, CPG offer a service it calls Slate2Screen to assist in all aspects of 3D production. Emphasizing its cross-media expansion beyond feature film, it made this announcement of the formation of CPG at the National Association of Broadcasters' convention in Las Vegas, rather than at a film industry event. The proponents – by which I mean the company promoting these features – claim their cameras and systems are “artist-centered” and give control back to those on the shoots rather than the special effects team later on. A material consequence is that Pace supplies just two personnel to whoever rents the system – an engineer and a systems supervisor. It doesn't supply directors of photography (DOPs), as its Fusion System is comparable enough to other kinds of high-definition shooting that special training is not necessary (Hurwitz, 2009, p. 32).

One feature of Cameron's visual instruments includes a way to produce immediate and on-set approximations of how 3D and performance capture will look. He did the motion capture portions of *Avatar* (2009) with a “virtual camera,” which was basically a hand-held monitor on which he could watch the performers. This screen was fed by a grid of a hundred HD cameras and, by moving it, he could record the camera work he desired, including pans, tilts, and tracking (Duncan, 2010; Duncan & Fitzpatrick, 2010). No lens to look through, no actual tracks laid for camera movement, and no individual lighting setups. For the live-action portions of *Avatar*, Cameron experimented with the “Simulcam,” developed with performance capture company Giant (DiOrio, 2009; Giardina, 2009). This allowed people on set to see, when looking through the camera eyepiece, takes with mock-ups of green-screen and motion capture elements. A limitation for CGI-driven shoots is the separation between filming personnel and digital craft workers whose enhancements to the film appear much later. The Simulcam gives directors and directors of photography the ability to see a rough approximation of effects that will be integrated eventually, and thus they have an immediate basis for on-set decision-making.

Regardless of the actual location of creative energy, in the least, the innovation and services offered by CPG reassert a conventional creative hierarchy for filmmaking. They allow for the existing networks of filmmaking labor to continue. Mark Deuze (2007) has documented the importance of networks of connections among personnel as they travel from credit to credit and from job to job. These informal relationships, he shows, are central to being able to maintain a steady flow of work

and to build a reputation. New production technology that can be introduced without disrupting these working relationships is therefore of premium value. Cameron's own stable of personnel travels across his films, and some have established a special expertise with the Fusion System (e.g., *Avatar* second unit director Steven Quale directed the 3D *Final Destination 5* [2011]). In sum, one of the advantages of Cameron's 3D and performance capture systems is that they can supplement, and hence reinforce, existing commitments to CGI, relations among crew, and digital exhibition concurrently.

Access and Apparatus

There are many telling commonalities across Cameron's three documentaries. First, it is important to note that the deep-sea locations build on the underwater experience Cameron had shooting not only *Titanic*, but also his earlier film *The Abyss*, which was an especially arduous and expensive feature about alien life forms, nuclear terror, and labor politics. The making of that film produced an ample supply of the definitive stories of Cameron's dictatorial monomania. He was reportedly so insensitive to the conditions of actors that several claimed to have nearly drowned, which Cameron denies (Lampert, 2009).

In *The Abyss*, the subject of the undersea oil workers realizing they are pawns in the company's operations represents an ideologically advanced critique that appears to contradict the actual working conditions Cameron himself created. His films routinely offer complex, if contradictory, depictions of abuses of technological power. *Terminator* might be best known for its dystopian views, depicting the lead-up to a devastating nuclear holocaust precipitated by initially benign but ultimately fateful decisions on the part of corporate managers and military contractors (like Cyberdyne's Miles Dyson, played by Joe Morton). *Aliens*, even with its visual fetish for weapons and their accessories, is a story of the fallibility of military command and corporate colonial ambitions. As James Kendrick (1999) has suggested, where most Hollywood films are superficially radical, internally conservative, Cameron's films are "superficially conservative, internally radical" (p. 38).

Yet these currents of ideological critique battle the mode of representation, which on screen figures in character facility with technological apparatuses and improvisation. In her classic feminist reading of time travel in *Terminator*, Constance Penley (1986) noted the "tech noir" aesthetic that includes representation of the everyday abundance of machines running the gamut from hairdryers to automated factory equipment. Typical Cameron scenes include the crew in *Aliens*, under siege by the creatures, scouring blueprints of the colony facilities on illuminated screens, trying to hatch an escape plan, and Kyle Reese (Michael Biehn) in *Terminator* teaching Sarah Connor (Linda Hamilton) how to make explosive devices from everyday materials. There is a recurrent image of technological investment and improvisation for narra-

tive action in these films. The acquisition, construction, and operation of machines and devices drive stories forward and set up the conflicts among characters. A case in point is Corporal Hicks (Michael Biehn) outfitting Ripley (Sigourney Weaver) with various weapons and explosives in preparation for one of her final battles with the Alien Queen creature in *Aliens*, which amounts to an unusually tender moment. Notably, this investment mixes the advances of new technological capabilities and a survivalist DIY approach to low-tech devices. This theme, in particular, reappears in *Avatar*, where the conceit of the drama is that part of the planet on which the majority of the action transpires is so humid and has such a strong magnetic field that some advanced weaponry is inoperable. Or, as Cameron confessed, "It's all an excuse to do helicopters versus pterodactyls" (Goodyear, 2009, p. 66).

These features display considerable thematic and aesthetic connection to Cameron's documentaries, where a brand of techno-fetishism, both improvised and cutting-edge, also drives the tales.¹⁰ Annette Kuhn (1990) has suggested that the attention to special effects makes science fiction films a notable genre in which the state of the cinematic art is expected to be encountered (p. 7). Cameron extends this aspect of sci-fi to his documentaries. To say that each of Cameron's documentaries is about undersea exploration only captures part of their subject matter. Each equally focuses on the technological means by which the images are being captured. It's not just that the cameras needed specially designed titanium casings to withstand the high-pressure environment of deep-sea shooting locations and lighting conditions; it is that the films announce these and comparable features repeatedly. The films become documentaries about the inventiveness of the filmmakers-cum-explorers and the complexity of the hardware as much as the purported subject of marine life and shipwrecks.

Ghost of the Abyss announces the core theme of visual technology, opening with a poetic camera tracking movement into an early twentieth-century stereoscopic slide-viewer, displaying several black-and-white period scenes of the famous ocean liner, with a slight tremor shaking the image as though a crude mechanism is flipping it to the next. On the final image, the figures in the slide begin to move, and the background dissolves to color and to the film's title. To remind viewers of the passing of media history, the film returns to these stereoscopic slides later on. One finds comparable techniques in other moments of technological transformation, including Al Jolson's opening declaration in *The Jazz Singer* (Alan Crosland, 1927) that "you ain't heard nothing yet," and Tom Ewell's direct address about stereophonic sound, color, and aspect ratio in the credit sequence of *The Girl Can't Help It* (Frank Tashlin, 1956), pushing the screen's edges horizontally to a widescreen format. Transitions of this sort carry spectators through a short evolutionary narrative of media format, essentially proffering improvements for the appreciation of audiences.

These stereoscopic images of *Ghosts* are computer generated from archival images, constructed to appear to be antique slides. Similarly, postproduction involved converting the various resolutions from the different cameras to a uniformly high resolution acceptable for IMAX screens. This conversion also involved software to approximate 3D effects for the images captured from the regular high-definition

cameras, as well as those produced in postproduction. And some shots of the wreck are in fact composite images, with technology “used by NASA,” as stated in one DVD extra, to produce complete images of planets and solar systems. Invoking the imprimatur of NASA suggests that it is state of the art and that it is not really manipulation of the visual record, which of course it actually is. In the end, the viewer is watching a composite image, rather like a mosaic or a David Hockney grid-like Polaroid portrait but with the seams between the smaller images rendered invisible (Kaufman, 2003).

In addition, Cameron has actors play out scenes from the sinking ship superimposed on these composite images of the wreck. These “ghosts” recreate the event of the sinking on the “actual” deck and in the “actual” cabins, though these sets are not to be found at the bottom of the North Atlantic, and only appear with CGI manipulations. One dramatic sequence involves a CGI representation of *Titanic*’s sinking with a fast-paced collage of archival photographic portraits of the victims falling into the wreck as though being sucked again into the vortex. Cameron’s efforts to scrape together as proximate a representation as possible of the actual disaster here replays the calamity using the only indexical traces remaining – places where passengers stood, pieces of objects they touched, and family photographs. The film wants to bring the spectator as close as possible to be a “witness to tragedy,” as one crewmember puts it. This impulse is driven home when, during their expedition, they receive news of the September 11, 2001, attacks. This prompts several comparisons between the two events, and sparks their resolve to memorialize the 90-year-old disaster by laying a plaque on the ocean floor.

Much of the adventure of *Ghosts* involves the cameras, getting them to the wreck and providing adequate lighting. The film displays not just the wreck but the special remote control cameras that get to the interior of the *Titanic*. Emphasizing the premium placed on technological presence, one of the dramatic episodes of the film involves the recovery of a remotely operated vehicle (ROV) that lost power – Elwood, incidentally. During this interlude, the ROV is described as one of the crewmembers, and a military credo is evoked that no one gets left behind (ignoring the fact that the credo isn’t “don’t leave broken hardware behind”). For a good portion of the dive segments we see several smaller inset images of crew, including Cameron and Paxton, observing and operating cameras and submersibles. In fact, these inset images obscure direct visual access to the wreck, as they lie on top of the pictures of the sunken ship.¹¹ While not exactly a film about cameras, there is enough attention to them that parts might have been called *Cameron’s Cameras*.

All three films present comparable thematic priorities. For instance, *Bismarck* is about the special submersibles that get people and cameras to the remains of the Nazi battleship. The MIR submersibles receive special attention in each film, with rollicking sequences of the Russian “Zodiac cowboys” who have to attach cables that will lift the submersibles back onto the ship by riding on top of them when they surface. The challenge of completing this task in rough seas becomes visually exciting, enhanced by a fast and dramatic musical score.

Aliens of the Deep is the most aesthetically ambitious of these three films. The opening presents a series of portraits of individuals and animals, which includes some crowd-pleasing tricks like an elephant unfurling his trunk directly at the camera and audience. We see an urban street corner, a dance club, then fireballs in space. A few shots of suburban life follow with a slow-motion IMAX-size 3D image of kids playing in a sprinkler and a chubby boy eating a messy hamburger in a fenced-in backyard, while a cow moos on the soundtrack. This sequence of a calculatedly spectacular ordinary sets up the animal–human, and terrestrial–extraterrestrial, connection that the rest of the film pursues. Several young scientists accompany Cameron, though the lead is Dijanna Figueroa, an African American marine animal physiologist doctoral student from University of California, Santa Barbara. In a surprising, perhaps ill-considered, turn, this film ends with speculative sequences about meeting moth-like alien beings, which in tone and appearance seem to appropriate the angel creatures from *The Abyss*. One sequence depicts a hypothetical method for melting through thick layers of ice with a nuclear-heated torpedo and a journey down through an extraterrestrial ocean by a fictional remote control vehicle, presumably several generations more advanced than Jake or Elwood.

The film ends with Figueroa and Kevin Hand, an astrobiologist, greeting an imaginary sea creature on the ocean floor through the glass of a submersible. “We have new friends,” Figueroa says in this *ET*-like moment of interspecies harmony, blending the real and the invented. Cameron’s documentary aesthetic does not hesitate to borrow from science fiction filmmaking in order to approximate the actuality of a scene or argument. The film advances a universalist idea about experience and knowledge, reasoning that the similarities between life forms give us warrant to extrapolate what we feel and know to others. This, for Cameron, includes creatures that, for all we know, do not exist, which is a fine conceit for a science fiction writer, but not sound argumentation for a documentarian.

With *Aliens of the Deep*, *Ghosts of the Abyss*, and to a lesser extent *Expedition: Bismarck*, documentary realism stretches to include computer-generated special effects. In this case, documentary is not the recording, or the creative representation, of reality but a display genre for visible effects. Importantly, not all effects are equally visible; some do not announce themselves as such and take a trained eye to identify them. Others are obvious and signposted, often by the narrator, with the effect of making each film a document of CGI representational strategies. Others form the basis of DVD extras. In a way, the extreme locations and the presence of the filmmakers in these extraordinary places – places that relatively few humans have ever visited – become the guarantor of authenticity for what, in the end, are constructed computer-based moving image productions.

Here we see a link between moving image innovations and other technological materials. Cameron’s particular brand of celebrity activism involves “gee-whiz” popular science and an environmentalism that embraces technological progress. Within weeks of the Deepwater Horizon oil spill in 2010, Cameron had convened a panel of experts and quickly produced a recommendation on how to stop up the

well. He offered not only his own state-of-the-art submersibles, but also to do it himself. And in March 2012 he successfully shot, diving in his newly designed submersible, some of the *Avatar* sequel and a new 3D documentary in what is known to be the world's deepest point 11 km under the Pacific Ocean in the Mariana Trench, a place where only two people have ever been before (Cohen, 2012). That's fewer than Mt. Everest and fewer than the moon. Cameron's investment in exploration vehicles for extreme shooting conditions might seem like the polar opposite of his investment in the virtuality of digital cinema, simultaneously plunging as deep as one can go into extraordinary location shooting and into simulation. But in fact they are products of the same impulse, both foregrounding the scientific-technological apparatus. Where Sean Cubitt (2004) points to the neo-baroque cinema of Cameron and others as involved in creating and presenting simulated worlds closed off from history and the social, we see here that the attention to unusual shooting locations and production processes – including pulleys, power sources, lights, ROVs, and performance capture software – stretches us well beyond that virtual seal.

These documentaries all involve Cameron as a central figure. He is on camera and is guiding the expedition as much as the narrator in each. *Ghosts* has Paxton, and *Bismarck* has Lance Henriksen, both part of Cameron's stable of actors, as non-expert narrators whose journey and introduction to the subject matter are written to mirror those of the audience. Paxton's amateur status is especially emphasized; his arrival on ship involves a staged comical interaction with a Russian crewmember who only speaks in Russian, making Paxton appear that much more on unfamiliar territory. He describes his nervousness about the upcoming dive, and later treats IMAX spectators to big-screen vomit upon return to the surface. These figures serve to bolster Cameron's experience and command of both the filmmaking and expeditionary situations. *Aliens of the Deep* uses student scientists to fill this "amateur" role.

By building his persona as a champion of science, explorer, and technological wizard, Cameron is, after a fashion, part of a long history of the expedition film, which often involved the anthropological, or quasi-anthropological, filmmakers of primarily European lineage traveling to some outlying location and population, returning with images of some strange earthly wonders. Cameron often refers to Jacques Cousteau as a major influence, but he is also not that far from the likes of Merian Cooper and Ernest Schoedsack, the explorer/showmen making *Grass* (1925) and the hybrid ethnographic/fiction feature *Chang* (1927) who then include the explorer/showman as a central part of their fiction films; remember that the original *King Kong* (1933), aside from the gorilla-girl love story, is about filmmaking and show business.¹²

Cameron's expedition trilogy asserts multiple times that we are watching the absolute cutting edge of imaging and transportation technology, with the newest and most complex gadgets, some custom made for the demands of these enterprises. And one can understand the appeal of this approach for the science museum context of many IMAX screens and for the Discovery Channel. On this point, each film presents Cameron as a cruel technological taskmaster, who is "totally reliant on technology"

(*Aliens of the Deep*), dealing with state-of-the-art machines that “push the limits of technology” (*Ghosts of the Abyss*). These three documentaries construct a relationship between technological and natural wonders: extreme machines for extreme shoots. Indeed, the National Geographic companion volume to *Aliens of the Deep* says this exactly (MacInnis, 2004, p. 20). If there is an environmental ethic, especially evident in *Aliens of the Deep*, it is one of awe, where viewers experience the eye-popping, jaw-dropping, spectacular vistas of unusual natural wonders. Robert Koehler (2003) wrote that *Ghosts* “is nearly overwhelmed by incessant chatter and expression of wonder by crew members” (p. 20), and Ronnie Scheib (2005) wrote of *Aliens of the Deep*, “as many ‘wows’ and ‘gee whizzes’ abound as do albino shrimp” (p. 67). But the natural world is not meant to hold a monopoly on the aesthetic of the awesome; these films extend this affect to the world of advanced technology. Buried beneath their titular subject matter, this expedition trilogy is essentially a series of “making of” documentaries promoting the ingenuity and resourcefulness of filmmaker/explorers in the seizing of remote sights for audiences back on dry land.

Technological Tentpoles

Some commentators, including Tom Schatz and Edward Jay Epstein, point out that a core element in the contemporary media business is intellectual property, especially the ownership of stories and characters and control of the multiple products that come out of franchises (Epstein, 2006; Schatz, 2008). Such attention helps explain the arrangements between Disney and Marvel to gain access to the latter’s stable of comic book characters, as well as the intense focus by the Motion Picture Association of America on piracy in recent years. Companies now exist to help others exploit their intellectual property. For example, Starlight Runner Entertainment specializes in the development and coordination of story worlds and mythologies, including characters, chronologies, geography, and weapons, with the intention of helping orchestrate “transmedia” incarnations of franchised works. They have done this work for *Pirates of the Caribbean* and are acting in this capacity for *Avatar*. As outlined in *Variety*, “Now that the franchise has replaced the blockbuster as Hollywood’s holy grail, a new tool has emerged to help those who want to extend film and TV properties across multiple platforms” – the “megabible” (Caranicas, 2009, pp. 5, 11).

To this extension of the media format and text of motion pictures we should add the intellectual property associated with technological systems. US cinema history has been profoundly shaped by questions and challenges to technological patents, starting with Edison, but continuing with Michael Todd (Todd-AO), Jerry Lewis (video assist technology), and George Lucas (ILM). But any technological apparatus still turns on content, especially as a way to sell the advantages and improvements of one format over another. Consequently, we can find notable occasions in which specially designated content is linked quite directly to new media systems. This link

is not about firsts but about log-jam-breakers, forgers, and tipping points. For example, Discovery Channel used *Expedition: Bismarck* to promote its high-definition format, and doing so with a mobile HD screen and theater installed temporarily at retail locations, like Best Buy, where new HD televisions were available to consumers. In such instances, the exact item being promoted is lost in the confluence of television channel, high-definition format, big-budget documentary, star director, and consumer electronics retailer.¹³

And this was where *Avatar* was a special stand-out. It was conventional in story and characterization, and it had the now conventional transnational economic impact of its production, spanning corporate participants from Quebec's Hybride to New Zealand's Weta Studios. But *Avatar* was celebrated and promoted as a flagship work beckoning the next wave of industrial and consumer technologies and entertainments. For instance, Panasonic's international cross-promotion deal with *Avatar* extended with the first 3D home version of the film, released in December 2010 – only available on Bluray and only compatible with Panasonic's Viera set (Raby, 2010). This exclusivity was set to run until February 2012. With *Avatar*, we had 3D filming processes, 3D exhibition, digital exhibition, and 3D home entertainment all banking on the film's appeal. Thomas Elsaesser (2000) has suggested that blockbusters act as prototypes for the future of cinema as they advance requirements and “set up standards” for new skills, production conditions, and exhibition environments (p. 191). In a way, the pairing up of new editions of videogames with new generations of consoles is the model here. Such film or audiovisual texts are *technological tentpoles*, under which not only commodities but also media formats slide into our lives as supposedly essential.¹⁴ *Avatar* was one such movie; one report even described Cameron's *Avatar* in exactly this fashion, as a tentpole for digital 3D (Hayes & Goldsmith, 2008). Technological tentpoles introduce and promote hardware and media systems; such entities advance a perpetually reconstructed cinematic apparatus as well as a wider audiovisual environment.

Consider *Avatar*'s newspaper advertising, which promised the routine geographic reach of a widely released blockbuster (“everywhere”) but also format choice (“everyway”) between 2D, digital 3D, and IMAX 3D presentations. A few years ago, David Denby (2007) claimed that the expansion of exhibition possibilities for film has produced “platform agnosticism,” such that people no longer care how and under what conditions they see films, resulting in a *coup de grâce* for traditional cinephilia. *Avatar*'s advertising showed just how erroneous Denby was. Instead, the multiplying formats have produced a heightened *platform consciousness*. In essence, the campaign sold media format and film at once.

The varieties of media materiality have ample representation in Cameron's vision of the future. *Avatar* is replete with screens on screen: 3D screens, topographical screens, video screens, computer screens, touch screens, hand-held digital tablets, and curved screens. The thematic centerpoint of the film – the conversion of our human characters into their respective avatars as giant blue extraterrestrial creatures, the Na'vi – appears as a form of transportation, with abstract blazing lights moving

through a tube to some distant material body, like a cross between teleportation and long-distance communication. *Avatar* is so embellished with interstellar cutting-edge media culture that one might be surprised to discover that it tells an anticolonial tale of an indigenous population's resistance to the exploitation of minerals on their home planet, Pandora, by invading Earthlings. For Cameron, the devastation of colonialism includes the consequences of technological change. Stating this theme directly, he said, "we're basically telling the story of the Americas and to a certain extent some of the other areas in the world that were conquered by the British, Dutch and so on, but we're really telling the story of what happens when a technologically superior culture comes into a place with resources that the conquerors want" (quoted in Nepales, 2009). As a political parable, it is a thinly veiled critique of imperial adventures by armed forces, ostensibly US in appearance and style (with at least one shot of "Old Glory" in the background). Bombastic dialogue about natives as terrorists, "preemptive attacks," "daisy cutters," and "shock and awe" tactics takes what might have been a John Milius film – for instance, *Farewell to the King* (1989), of which *Avatar* is in many ways a remake – and reframes it as a critique of the US invasion and occupation of Iraq.

As influential as his work has been for nonconventional gender depictions, especially his muscularization of female action characters, the limits of Cameron's imagination are apparent in his racial politics. In *Avatar*, the species-specific divide presented on Pandora is recognizably driven by familiar earthbound notions of difference. His extraterrestrial indigenous peoples are a version of the noble savage, living harmoniously with their environment until greedy colonial invaders disrupt their spiritual bond with nature. Even as the drama directs audiences to cheer for the spiritually advanced and environmentally aware Na'vi, we confront stereotypical gestures and appearances of tribal peoples. Moreover, the actors behind the virtual costumes and makeup are suitably ethnicized to perform the "blueness" of the Na'vi. African American actors C. C. H. Pounder and Laz Alonso, and famous Cherokee actor Wes Studi, play lead Na'vi characters, and Dominican/Puerto Rican American actor Zoe Saldana plays hero Jake Sully's love interest. Pointedly, only White folk, like our lead Sully, get to cross over into their Na'vi avatars to live among the natives. Sully's story, then, is a "Na'vi like me" tale of passing. The core of the film is a "blueface" performance, which draws this film closer thematically to the other most referenced "game-changing" film, the breakthrough talkie *The Jazz Singer*, in which, in a way, Al Jolson's stage persona is *his* racialized avatar.

The world of the noble savage offers ideologically safe contact with the natural and the archaic, that is, civilization's other. In Cameron's case, the environmental ethos of the Na'vi, while reiterating the trope of nobility, is equally a way to present harmonious connections among all beings, using contemporary technological references to do so. Characters describe Pandora as a complex and complete data network, where even plant life has communicative capabilities. The Tree of Souls, the spiritual heart of the ecosystem – female, of course – holds records of all feelings, expressions, and memories. It is, ostensibly, a colossal organic server. Flying into battle, individual

Na'vi can communicate across distances by placing thumb and forefinger on either side of their throat, like a mimed handless mobile phone. Several scenes show the temporary intertwining of animal and humanoid as a kind of jacking-in of electrical filaments. Moments of these fusions are, in many ways, the most erotic renderings in the film, with abundant rolling eyes and pleasurable gasps. And plenty of talk about fidelity follows, too. Once selected, connected, and tamed, the pterodactyl-like flying creatures serve as your permanent transportation vehicle, which makes me wonder if this interspecies monogamy is actually a form of brand loyalty.

As figured, the Na'vi are not merely representations of an ancient and superstitious world view; they offer an image of a superior technological system. Pandora is worth defending, then, as an example of perfect synergy across beings and devices, with integration a racial, environmental, and technological concept simultaneously. This planet offers a world of natural networks. So when Sully, permanently "avatared" as Na'vi at the end of the film, remains behind on Pandora after winning the battle against the invading colonial forces, this is not a refusal of technological enhancement for some form of native spiritual awareness but a full acceptance of what might be called technological naturalism. This unambiguously anticolonial story, by the end, sneaks in the true colonists, those hybrid avatars. The technological game-changing film is itself a tale of full acceptance and assimilation, at the level of the genetic, with an even more advanced game-changing technological system. In a moment of corporate reflexivity, it should not go unnoticed that the logo for Cameron's production company Lightstorm – a thin, angular, blue individual readying a bow and arrow – bears an uncanny resemblance to the 10-ft. creatures populating Pandora.

Cameron does not fit the mold of what we expect of a Hollywood A-list director. And this ultimate insider-outsider had not had any Hollywood agent since the early 1990s until 2009, when he signed with CAA, ostensibly to represent him as the *Avatar* franchise develops and as his technological processes are marketed ("Titanic helmer docks with CAA," 2009). There are easier ways to make money in the film business than trying to find a way to light the pitch darkness of three miles under the ocean, designing camera containers to withstand the pressure of deep-sea shooting conditions, and changing the frame rate to improve a 3D effect. *Ghosts* cost about \$13 million and brought in a little over \$22 million worldwide box office, a tidy sum for a documentary, but hardly an IMAX record, let alone an example of Cameron's stratospheric moneymaking prowess (Holson, 2003).

The point here is that it is easy to get caught up in the conventionality of Hollywood – buy a recognizable property, construct a star-driven vehicle with the appropriate smattering of romantic interest and international appeal, plan a big opening, follow through with releases of related commodities, then the DVD, and so on. With Cameron, we see that there are different, and influential, ways to navigate the demands of the media system industry. In our blockbuster-driven period, we might skip over documentaries such as Cameron's as side projects and inconsequential labors of love. And yet there is continuity through his entire oeuvre. Recognizing this, we need to be prepared to see the extraordinary range of corporate investments

and priorities, which produce a greater cross-sector industrial beast and a fundamentally unstable technological apparatus. Cameron, in a sense, is an exemplar of the current phase of Hollywood history, in which the business of film is bound up with a range of media products, technological forms, and types of intellectual property. John Caldwell (2008) argues in his book *Production Culture* that not only is every script a business plan, it is also a branding opportunity. With Cameron the technological auteur, a script is equally a plan for the remaking of the cinematic apparatus and conventional modes of industrial and technological practice.

Most impressively, the language of revolutionary shift is not new; indeed, it has been a persistent feature in the film business. Never content with an existing apparatus, Hollywood competition has battled over formats, technologies, and processes as much as stars, directors, and movie franchises. Declarations of “game changing” and “technological revolution” are forms of competition at the level of hardware and software. We might see figures like Todd, Lewis, Lucas, and Cameron, rather than inventors, as the carnival barkers of the technological tentpoles. The benefits to becoming a new “industry standard” are immeasurable, and they can include markets beyond films into a number of other industrial sectors. In this way, an individual audiovisual entertainment like *Avatar* works to reinstate the dominance of key corporate participants, making technological change appear inevitable and natural. At one level, even with all the local instances of innovation – and yes, to be sure, the entertainment business is shifting dramatically – the language of “game changing” is another way to talk about business as usual.

ACKNOWLEDGMENTS

The author wishes to thank Kelly Gates for her perceptive commentary during the preparation of this chapter, and Zoë Constantinides for essential research assistance. Versions of this chapter were presented at the “What is Film?” Conference (Portland, Oregon, 2009), at the Toronto International Stereoscopic 3D Conference (2011), and as the James Naremore Lecture (Indiana University, 2011).

NOTES

- 1 Justin Wyatt and Katherine Vlesmas (1999) have argued that the public drama of the budget and production problems in fact played a key role in the marketing, and ultimately the success, of *Titanic*.
- 2 Two prominent profiles were a 60 Minutes story, called “Cameron’s *Avatar*” (Browning, 2009), and another by Dana Goodyear (2009) in the *New Yorker*.
- 3 For example, “New *Avatar* behind-the-scene photos,” www.comingsoon.net, January 12, 2009.

- 4 "Ubisoft and Fox team for *Avatar* game," www.comingsoon.net, July 24, 2007.
- 5 "Exclusive: Soderbergh gives *Avatar* high praise," www.comingsoon.net, April 30, 2009. Cameron was a producer for Soderbergh's *Solaris* (2002), so it is possible there is a closer relationship than is evident from their different filmmaking personas.
- 6 Two superior studies of special effects and cinema technology that include analysis of Cameron's specific impact are Pierson (2002) and Cubitt (2004).
- 7 It is curious that 3D is being interpreted as a catalyst for digital exhibition because the digital 3D systems currently require screens that make conventional 2D digital projections darker and less sharp.
- 8 See "Panasonic and Twentieth Century Fox team for global promotion of James Cameron's *Avatar*" (2009) and "Panasonic rolls with HD 3D home theater truck tour" (2009).
- 9 For a full analysis of this feature of Cameron's films, see Krämer (1999).
- 10 Cameron's techno-fetishism is dealt with by Alexandra Keller (2006) in her study of him as a blockbuster auteur.
- 11 When asked what he learned from this shoot, Cameron replied that the dives were so expensive that focusing on the divers is "counter-productive"; "it's stupid to be turning the camera around inside and pointing it at the people, when you should be focusing on the marine life and the geology" (quoted in Hurwitz, 2005, p. 62).
- 12 In this respect, *Avatar* seems to be a direct attempt to take the jungle expedition film from the 1920s and 1930s into outer space. Cameron has said, "It's an old-fashioned jungle adventure with an environmental conscience," and he has cited as a primary inspiration Edgar Rice Burroughs's John Carter of Mars (Barsoom) series (Rampton, 2006, pp. 14–15; Jensen, 2007).
- 13 "Hendricks's wide world at HDTV: Discovery chief focuses in on a new platform," *Multichannel News*, May 5 (2003), p. 4A; "ESPN, Discovery plug HD at retail: Basic networks look to drive penetration for local ops' new offerings," *Multichannel News*, June 9 (2003), p. 38.
- 14 Along the same lines, the hand-held device industry has followed iPhone's lead on "apps" as a way to designate the special, indispensable aspects of its product. While many are cute and amusing, most reproduce information that is not especially hidden (temperature, location, time, cultural recommendation, game, etc.), albeit in an immediate and miniaturized form. Though many competing companies offer "apps," note that the term offers a clumsy pun, simultaneously referencing "applications" and "Apple Corporation." The measure of worth of this function is not the single, breakthrough utility of any one but the quantity of them. "Apps" are valuable because there are so many of them, over 250,000 currently offered for the iPhone alone. Their relation to the movement and expansion of the hand-held electronic market is not that of the technological tentpole. Instead, they are *technological tent-pegs*.

Infrastructural Changeover

The US Digital TV Transition and Media Futures

Lisa Parks

ABSTRACT

Media and communication studies scholars have been tracking the US digital terrestrial television (DTV) transition for over a decade, conducting research crucial for understanding the future of media systems. The existing research tends to focus on two areas. First, some scholars have used diffusion theory to consider issues of technological adoption, exploring the relative willingness of consumers to adapt to DTV. Second, others have examined how the transition has impacted the consumer electronics industry and the United States' precarious position in that global industry. Few, if any, have engaged critically with the ways that the federal government, trade organizations, and community groups have communicated with the public in an effort to prepare them for the digital TV transition. In this chapter, Lisa Parks adds a vital dimension to existing work in this area by exploring how technical information about DTV was communicated to the public in the months leading up to the transition. Examining a variety of materials, from press releases to news reports from public service announcements to video kinescopes that document the end of analog service, Parks considers how consumer-citizens were addressed by public outreach initiatives and how they negotiated the digital TV transition. She highlights three issues crucial for understanding this major infrastructural transition: (1) the way fixed-income and minority communities have been singled out in relation to television; (2) the uneven geographies of the transition; and (3) the way viewers and digital corporations have responded to the transition in its aftermath.

Infrastructures are complex systems. They are challenging to describe in language and impossible to study in their entirety. They involve investments, materials, hardware, landscapes, habitats, policies, companies, governments, workers, and users, among other things. Despite the fact that infrastructures combine so many aspects of modern life, they are things that most of us tend to ignore. In his field guide to infrastructure, Brian Hayes (2005) offers descriptions and photographs of the “power lines, water tanks, streetlights, manholes, traffic signals, cellular towers – that we pass by every day and yet seldom really notice” (p. 1). He continues, “These are places that most of us never see close up; many of us would go out of our way to *avoid* seeing them” (p. 1). Such places, I want to suggest, are highly relevant to the future of media studies, but merely noticing them is not enough to mount a critical study of infrastructure. Such a project requires the capacity to recognize infrastructures as sites of dynamic and powerful yet largely imperceptible processes occurring at macro and micro scales that are crucial to everyday life.¹

Indeed, one of the goals of this chapter is to begin to develop a critical imaginary and vocabulary for the study of media infrastructures – the technologies, physical sites, and processes implicated in the local, national, and global distribution of audiovisual signals. In the field of media studies the word “network” is widely used to conjure up the Big Three (ABC, CBS, NBC) or major cable channels and it is increasingly aligned with web-based social media derived through Facebook and Twitter. The term network also is understood more generally as a way of organizing culture and communication. The word “infrastructure” is used less frequently in media studies and more often is associated with fields such as urban studies, geography, or electrical engineering.² I use the term because it enables exploration of several critical issues. First, the term infrastructure emphasizes *materiality* and physicality and challenges us to consider the installations, hardware, sites, and processes through which audiovisual signals are trafficked. Second, the term infrastructure helps to foreground processes of *distribution* that have taken a back seat in much media studies research, which has tended to prioritize production and consumption, or encoding/decoding. Third, by referring to systems that are embedded within and dispersed across vast territories, the concept of infrastructure can encourage media studies’ further engagements with environmental studies, geography, and global studies. Fourth, an infrastructure is difficult to visualize in its entirety within a single frame, and, as such, can help to stimulate new ways of imagining and *visualizing* what media technologies are, where they are situated, and what they do. Finally, the term infrastructure necessitates a consideration of social power. Infrastructures are not inert entities; rather, as Stephen Graham and Simon Marvin (2001) suggest, “infrastructure networks embody power relations and reflect highly uneven political-economic struggles between firms, state and public sector organisations and wider social agents” (p. 195). In sum, the concept of infrastructure can bring to future media studies an intensified focus upon issues of materiality, distribution, environment, visualization, and social power.

This chapter highlights the last two categories – visualization and social power – in an examination of the US digital terrestrial television (DTV) transition of 2009. This

transition culminated in a nationwide switchover from a system of analog to digital television broadcasting, and while it promised citizens a clearer, sharper picture on their television sets, it also made generations of institutional and consumer equipment rapidly obsolete and resulted in signal loss for some viewers. This moment was significant because it brought to the fore the idea of television not only as a form of entertainment, but also as a national infrastructure subsidized by taxpayer dollars and service subscriptions and regulated by the federal government. Indeed, the DTV transition created an opportunity for citizens to look at television in a different way and to think about where signals come from, who owns them, and how they are regulated. As the transition afforded citizens the opportunity to recognize television as an infrastructure, it also brought the socioeconomic disparities and unevenness of media markets across the United States into bold relief and enabled the television industry to refine its marketing and outreach to particular communities.

Media and communication studies scholars have been tracking the DTV transition for over a decade, critically examining federal policies, technological changes, and entertainment industry practices. Existing research has focused on two areas. First, several scholars have used diffusion theory to consider issues of technological adoption focusing on the willingness of consumers to adapt to digital television (Chalby & Segell, 1999; Weber & Evans, 2002). Second, others have examined how the transition has impacted US consumer electronics and its fledgling position in that global industry (Castañeda Paredes, 2003, 2007; Hart, 2004, pp. 60–83). Few, if any, have engaged with the discourses of public outreach initiatives and their address to specific communities. In an effort to supplement this work, this chapter explores how technical information about digital television was communicated to the public in the months leading up to the transition. Examining a variety of materials, from news reports to maps, from public service announcements to videos documenting the end of analog service, I explore how consumer-citizens negotiated the DTV transition in different ways. In the process, I highlight three issues: (1) the way fixed-income and minority communities were singled out in relation to television; (2) the uneven geographies of the transition; and (3) the way viewers and corporations responded to the termination of analog transmission and the opening of spectrum space in the transition's aftermath.

By framing the DTV transition as an infrastructural changeover, I intend to emphasize the discursive aspects of infrastructure and the forms of communication and visualization that helped to make it meaningful and tangible to people. The changeover involved much more than a push of a button. It required intensive planning, publicity, and preparation at multiple levels and by multiple parties. While broadcasters upgraded equipment and altered the broadcast standard, citizen-viewers replaced or modified their television sets with digital converters. Without their compliance the commercial television system would no longer have functioned. Given these circumstances, I consider infrastructure to include the physical sites at which individuals installed, operated, and modified hardware to receive digital television signals, as well as the ways in which federal agencies, trade and community organizations,

and individuals defined, facilitated, and/or contested the shift in the national television broadcast standard. In this sense, infrastructure refers not only to an array of dispersed technological objects and technologized sites, but also to processes of funding, representing, activating, using, modifying, communicating about, and regulating them.

No Viewer Left Behind

The changeover to DTV was scheduled to occur in the United States on February 17, 2009. The federal government had been preparing for the transition since the 1990s, mandating that new TV sets be manufactured with digital tuners, supporting broadcast stations as they phased out analog and phased in digital systems, and informing consumers about the imminent changes. This historic transition, compared to the inauguration of color TV, and referred to as the DTV transition, was widely publicized. By the late 2000s regulators, broadcasters, and manufacturers had already made many of the key decisions about the future of television, but technological negotiations remained for many consumer-citizens. In December 2008 an estimated 19 million US households were still using analog television sets. In technology studies we often hear of “early adopters” and we might call this group the “diehard users.” Owners of analog sets had to decide how and whether they wanted to continue to receive a television signal and could either purchase a digital converter box or a television set with a digital tuner, or subscribe to cable or satellite television. The federal government subsidized the DTV transition and the National Telecommunication and Information Administration (NTIA) administered a \$1.5 billion coupon program to support those who wanted to retrofit their analog receivers with converter boxes.

In January 2009 the US Congress decided to push the DTV transition deadline to June 12, 2009, in part because a Nielsen Corporation survey indicated 6.5 million US homes were still not prepared (“6.5 Million U.S. Homes,” 2009). Additional funding for the transition came from the Obama administration’s federal stimulus package in the amount of \$650 million, which supported the converter coupon and public outreach programs. As Senator Rockefeller, who introduced the delay bill, observed, “The transition is going to hit our most vulnerable citizens – the poor, the elderly, the disabled, and those with language barriers – the hardest” (Stelter, 2009a).

The Telecommunications Act of 1996 mandated the digital TV transition and since then several players with varied interests have maneuvered to benefit from the shift. Consumer electronics manufacturers stood to increase profits from the sale of digital TV receivers, converter boxes, and antennas. Cable and satellite providers hoped to attract new subscribers and became increasingly competitive with one another. Consumers upgraded their systems based on the promise that DTV would bring a “clearer and better” picture as well as new channels and services. Federal agencies

hoped to effectively facilitate this nationwide infrastructural shift and take credit for a smooth transition. Broadcasters, however, had the most to lose since any kind of signal interruption – whether resulting from confusion on the user end or the limited range of the digital signal – could lead to a reduction in viewership and therefore a decrease in ratings and advertising revenues.

While much recent media scholarship has focused on cable, satellite, and web-based TV, it is important to recognize that a significant chunk of the US TV audience – roughly 15% – has opted out of such services and continued to receive free, over-the-air signals for decades. The moment of the DTV transition could just as easily have triggered scholarly investigations of the analog diehards as it did of technophiles eager to join the so-called “digital TV revolution.” Given the fixation on novelty in our technoculture, there is much to learn from consumers who, whether by default or by choice, continue to use machines simply because *they still work*. It is too easy to equate the use of old machines with poverty or reticence alone.³

Many assumed that analog TV viewers were elderly folks who grew up with rabbit ears, and indeed some of them were. Yet a glance at the Federal Communications Commission’s DTV transition website reminds us just how diverse the US analog TV audience was. In 2009 information about the transition was provided in the following languages: Amharic, Arabic, Bosnian, Cambodian, Chinese, Creole, French, Hmong, Japanese, Korean, Kurdish, Laotian, Navajo, Polish, Portuguese, Russian, Somali, Spanish, Tagalog, Vietnamese, and Yupik. That this array of languages appeared on the FCC website suggests that non-English-speaking ethnic communities were particularly affected by the transition. Indeed, some such communities have historically received local over-the-air programming in their own languages. One public service announcement about the digital TV transition featured a Somali American woman conveying information about the transition to her community in the Twin Cities. Another featured two White men demonstrating how to install a converter box, yet the voiceover dub was in Hmong and had English subtitles as well. Yet another made by students participating in the American Indian Summer Institute showed the father of the home jerry-rigging rabbit ears with foil in an effort to get reception while his family watched in anticipation.

In 2007 Nielsen Corporation released results of a study that found that low-income, elderly, Hispanic, and Black viewers were the least prepared for the transition. The Federal Communications Commission (FCC) and National Association of Broadcasters (NAB) used the survey as a basis for their many public outreach programs, targeting elderly, minority, and low-income communities, many of whom lived on fixed incomes and could not afford to purchase new television sets or subscribe to cable or satellite television. The Nielsen survey drew attention to populations that are, for the most part, ignored by the commercial television industry, and it was used to foster what I refer to as a “no viewer left behind” policy. For decades, the interests of the elderly, the poor, and ethnic minorities have been strikingly incongruent with those of the commercial television industry. There are few, if any, prime-time network TV series or major national cable channels addressed exclusively

to elderly, low-income, and/or ethnic minorities, except for Spanish-language channels such as Telemundo, Univision, and Galavision, and the African American cable channel BET. With the shift from analog to digital, however, there emerged a change of tune. Suddenly broadcasters began to express concern about these constituencies. This concern was registered not in a shift in program content but through the development of major public outreach campaigns conducted by organizations such as the NAB, which desperately tried to maintain viewership during the transition so that no viewers would slip through the ratings cracks.

National trade and community organizations went to great lengths to communicate with viewers about the DTV transition in the months leading up to it. Public service announcements (PSAs) heralding the changeover appeared on television and online. They ranged from high-budget flashy videos of trade groups to more home-grown productions by local organizations and provided a sense of how people were encouraged to understand and participate in the transition. While some PSAs offered step-by-step instructions about how to hook up a converter box or emphasized the superior quality of the DTV signal, others were more provocative and comical. One PSA sponsored by the National Cable and Telecommunications Association that frequently aired on CNN featured a sixty-something man strolling contemplatively through a barren landscape; as the sun set behind him, he announced the end of analog and birth of digital TV, urging preparedness for the baby boomer demographic. Another starred former FCC Chairman Kevin Martin with a direct address to TV viewers in which he proclaimed, "Your TV needs to be ready so you can keep watching!" Yet another presented a popcorn-munching family huddled around a suspense show that disappointingly turns into static. The American Disabled Peoples Association made a PSA, structured as a music video, showing several "doctors" performing surgery on their TV receivers while the ABBA song "S.O.S." blared on the soundtrack (Wandres, 2008). Finally, a late-night TV parody revealed a sweet elderly woman trying to set up her converter box. After wrestling with tangled cables she asked, "Will all of this make Jack Benny come back?" She then snipped a cable with her scissors and stuck her remote control in the microwave in a desperate effort to capture the digital signal.⁴

While this parody no doubt stirred a chuckle, much press coverage of the DTV transition positioned senior women as archetypal "neighbors who need our assistance." For instance, *The Oregonian* featured a photo of 87-year-old Bernice McNeel with the caption "no signal" and indicated that after installing two converter boxes, McNeel was still unable to receive all the channels she had before. The article explained that reception problems are "especially common in Portland where hilly terrain complicates reception and where an unusually high proportion of people rely on over-the-air broadcasts to watch programs" (Rogoway, 2008). A *New York Times* article showed a photo of 77-year-old Houston resident Vesta Clemmons as she watched a meals-on-wheels volunteer hook up her converter box so that she would not have to miss her favorite TV show, "World News with Charles Gibson" (Steinberg, 2009). Some senior men apparently had challenges with the transition as well. For

instance, a 70-year-old Joplin, Missouri man was arrested and charged with unlawful discharge of a firearm when he shot his television set after trying unsuccessfully to set up his converter box (Eggerton, 2009).⁵

The collection of PSAs, of which I have mentioned a tiny sliver, is important in that it registers the various ways in which citizens were encouraged to understand and negotiate the changeover from analog to digital television. Most of the PSAs emphasized the importance of keeping the television set operating, which served divergent agendas. Broadcasters (local stations, national networks, and trade organizations) blanketed the airwaves with PSAs not because they were concerned about their public service mandate, but because they did not want to lose viewers in the transition since their advertising fees are contingent upon ratings. Civil rights groups, on the other hand, insisted that access to television is important because it is a source of vital information such as weather reports, tornado warnings, fire evacuations, school closings, and daily news needed by all citizens.⁶ While the no viewer left behind strategy of commercial broadcasters was motivated by the prospect of revenue loss, civil rights groups used the occasion to underscore television's role as a public utility.

Indeed, civil rights and eldercare organizations supported a number of DTV transition outreach projects. The Washington, DC-based Leadership Conference Education Fund organized Digital TV Assistance Centers in major cities across the United States, provided technical materials that could be translated into different languages, and trained volunteers to install converter boxes. The organization partnered with local groups to help ethnic communities across the country, whether Chinese Americans in San Francisco or African Americans in Atlanta (see Wandres, 2009). As a San Francisco-based volunteer observed, technology is very complicated for many people and it becomes even more complicated when encountered in a foreign language. For consumers who do not speak English, it can be very difficult to know which converter box to buy at the store, much less how to install it at home, because instructions are typically in English.⁷ Even for those who do speak English, the purchase and installation of new consumer electronics can be confounding. As David Nye (2007) suggests,

When manufacturers present new machines as "black boxes" which one cannot understand much less modify or repair, many people use them only until they need renovation or upgrading and then abandon them. When consumers give up on repairs, they can easily feel trapped, forced continually to upgrade their systems, as manufacturers determine the pace of change and the possible linkages between their machines. (pp. 220–221)

The DTV transition left consumers with no choice other than to replace or modify their TV sets if they wanted to continue to receive a signal. Though millions of analog sets were still functional and in use, the changeover created a situation of structured obsolescence that led to compulsory upgrading as well as massive amounts of e-waste (Miller & Maxwell, 2012).

Since the DTV transition affected many elderly citizens living on fixed incomes, local senior citizen centers and national organizations such as AARP, Elders in Action, and Meals on Wheels mobilized in an effort to help. Senior citizen centers hosted public lectures about the changeover (sometimes attended by FCC commissioners themselves) and distributed FCC information packets. AARP provided a DTV information hotline in English and Spanish and published a series of articles about the transition on its national website and in its magazine ("Get Ready for Digital," 2007). Meals on Wheels programs from Minneapolis to Houston organized converter box installations for seniors who were already having hot meals delivered (Meals on Wheels Association of America, n.d.).

Local communities also banded together to figure out ways of addressing the shortage of federal coupons for converter boxes. By December 2008 the coupon program had run out of funding and an estimated 2.6 million people remained on the coupon waiting list. While 44 million coupons had been distributed, only 18 million had been redeemed (Hart, 2008). Informal economies emerged as a result. The \$40 coupons expired after 90 days of receipt, but they were transferable. Thus local churches and community organizations began to collect and redistribute unused coupons as a way of helping those on the waitlist or others who needed them. While major chain stores charged up to \$100 for new converter boxes, some local electronics stores charged only \$40, which was the value of a coupon. At its 3,400 stores retail giant Wal-Mart sold converter boxes for \$9.87 with a digital coupon (for a total of \$49.87) ("DTV Transition: Wal-Mart," 2008). Others who acquired coupons but did not plan to use them attempted to scalp them on Craigslist for \$20 or best offer. Still others set out to impede the purchase of converter boxes altogether by posting a YouTube video claiming the Magnavox converter box sold by Wal-Mart was equipped with a tiny camera and microphone and that the DTV transition was at the heart of a conspiracy to extend surveillance into the US home.⁸

The DTV transition occurred in the midst of an economic recession in the United States. Though provisions for the changeover were included in the federal stimulus package, an economic crisis makes conditions worse for those who are already struggling. In 2009 the unemployment rate hit 10% in several states; many families were faced with the loss of their jobs and homes and were simply trying to keep food on the table. Within these conditions, the prospect of purchasing a new digital television set, converter box, or antenna, or subscribing to cable or satellite television, was a luxury many could not afford. One writer encouraged people living on fixed incomes to immediately give up their cable or satellite subscriptions and make the necessary investment to access free digital TV. By his calculations, doing so could save the consumer \$30,000 over 20 years (Weitzel, 2009). A representative of the Leadership Conference on Civil Rights contextualized the issue of television cost in another way, indicating, "a successful transition from analog to digital television is vital to ensuring that those who may be on the remote edges of the economy and society, and already on the wrong side of the Digital Divide, do not suddenly also find themselves on the wrong side of a Digital Television Divide" ("Transition in Trouble," n.d.). Civil rights

groups adopted the no viewer left behind logic to ensure that those who lacked Internet access would not also be cut off from television.

In the months leading up to the changeover, there was more press discussion and recognition of the interests of the poor, elderly, disabled, and ethnic minorities in relation to digital television than in relation to other federal programs for education, healthcare, or housing. While this concern for low-income, elderly, and minority communities may seem on the surface to be a good thing, it also exemplifies a paternalistic posturing toward these communities that figures them as uniquely dependent upon television above all else. What this discourse conceals is how deeply dependent the US commercial television industry is on a viewer body count. A substantial loss in numbers of viewers threatens to compromise the business model of US commercial television. Since the Nielsen rating samples are randomly drawn, each and every viewer in each and every household counts.

Leaving no viewer behind required coordination among broadcasters, the FCC, and community organizations. While the FCC spent \$3 million on its DTV public education campaign, broadcasters spent \$697 million on their comprehensive DTV transition media plan (NAB, 2008). Nonprofit community organizations not only conducted public outreach, but volunteers performed much of the hands-on work in citizens' homes. The success of the infrastructural changeover was contingent upon the federal government's delegation of public information campaigns and home-based assistance to business and nonprofits. This practice coincides with patterns of neoliberal governance in which vital functions of the state are privatized and outsourced to corporations, charitable organizations, and individuals. In *Better Living Through Reality TV* Laurie Ouellette and James Hay (2008) explore how television has been reinvented as a site of neoliberal governance. They argue that reality TV series rationalize and extend neoliberal governance and citizenship by privileging the self-reliance of individuals and goodwill of corporations (as opposed to the welfare state) through the makeover, remodeling, and acts of self-sacrifice. "Understanding how TV operates as a new form of neoliberalized social service, social welfare, and social management," they write, "involves turning attention to the formation of specific networks between TV, the State, and private (volunteer and corporate) entities, which act upon each other and which citizens must rely upon and navigate" (p. 18).

The DTV transition involved a similar constellation of state, corporate, and charitable entities that addressed citizens in ways that echoed the discourses of charity TV. While reality TV's home makeovers and personal transformations emphasized the virtue of self-cultivation as a vital dimension of liberal governance and civil society, DTV transition PSAs and outreach campaigns celebrated equipment upgrades and "switching over to digital" as if they were civic duties. Indeed, many discourses surrounding the changeover idly fostered a logic of "*better living through digital TV*," articulating the capacity to receive DTV signals with home improvement and good citizenship. Leaving no viewer behind not only served corporate interests, but further elaborated television's neoliberal reinvention.

Out of Range

In addition to being the subject of PSAs and community outreach programs, the DTV transition was visualized and conveyed in coverage maps circulated by the FCC and NAB. These maps demonstrated the effects of the transition from local, regional, and national perspectives. They also offered a different view of television, an infrastructural perspective that emphasized the territorial reach of US television networks. National maps of the ABC, CBS, NBC, Fox, and PBS networks were used to illustrate which areas would receive signal gain or loss, with orange shading indicating loss, yellow indicating change of affiliate station providing coverage, and green indicating gain (FCC, n.d.). Figure 12.1 shows the FCC's national ABC coverage map, revealing the transition's anticipated impact on the reception of the network's signal in the Midwest. Orange dots indicate areas across the states of Iowa, Missouri, and Kansas projected to undergo signal loss with the conversion to DTV. By examining such maps it is possible to recognize the challenge of visually representing television infrastructure and to observe some of the unevenness and false promises of the DTV transition.

Indeed, despite the promises of glossy trade organization PSAs, as these maps reveal, the conversion did not occur equally for all. In 2009 the FCC predicted that after the transition 196 or 11% of the nation's 1,749 full power stations would have a signal that reaches at least 20% fewer viewers than their current analog signals ("Some Stations to Lose Viewers," 2008). Many viewers on the edge of a station's coverage lost television service. Some needed not only a converter box, but a new rooftop antenna and a booster as well. Public information campaigns emphasized the clarity of a digital TV signal but neglected to explain that digital signals are more susceptible than analog to topographical interference and thus many would experience reception problems. Digital signal strength can vary depending on factors such as building construction, neighboring buildings and trees, weather, and reception equipment. One home in a neighborhood could get great reception, while another up the block could have its clear picture obscured by a tall tree or far-off hill. Analog signals fade gradually and as the signal weakens a distorted or grainy picture is still often visible. Digital signals remain uniformly sharp and when the signal weakens the picture drops out completely. The sudden loss of a digital signal is known as the cliff effect (Furchgott, 2008). Many viewers in rural, fringe, or mountainous regions who were once able to receive a degraded signal from analog stations found that after the DTV transition there was no available signal ("Digital Transition May Leave," 2009).

Broadcasters, antenna manufacturers, and cable and satellite operators used coverage maps to target these "out-of-range" citizen-consumers who were unable to receive free digital TV channels and were forced to purchase other services or devices, whether a cable or satellite subscription or a high-powered multidirectional antenna. In this sense, these maps not only specify zones of television reception, they

Figure 12.1 The FCC's national ABC coverage map, which reveals the DTV transition's anticipated impact on the network's signal across the country. <http://transition.fcc.gov/dtv/markets/>

Figure 12.2 This “National Targeting for Digital Conversion” map shows areas with a high proportion of over-the-air (OTA) households. <http://www.al-ba.com/images/countymap.jpg>

intimate the location-based or geo-economic strategies of the broadcast and consumer electronics industries. One map used by the NAB, entitled “National Targeting for Digital Conversion” (see Figure 12.2), shows areas with a high proportion of over-the-air (OTA) households in need of targeting for DTV outreach marked in gray, dark gray, and light gray. In gray areas 30% of households receive over-the-air signals, in dark gray areas 25% do, and in light gray areas 20% do (NAB, 2008). Read another way, the map pinpoints areas where there is a high proportion of low-income, ethnic minority, and/or elderly residents still using analog TV sets, locations that broadcasters targeted in their efforts to leave no viewer behind. Another map entitled “Digital Stations by DMA: Moving Toward the Switch” provides the opposite perspective (see Figure 12.3). Dated in 2007, two years before the transition, this map reveals designated market areas with TV stations already operating in digital. Both maps make the notion of a DTV divide intelligible by highlighting areas in the United States with greater or lesser access to DTV.

Such maps enabled the NAB to conduct what it called “grassroots marketing” related to the DTV transition. For instance, the NAB sponsored a \$7 million project called the DTV Road Show, a traveling exhibit that made four major routes across the United States (NAB, 2008). Beginning in November 2007, two “DTV Trekkers” – moving trucks designed to resemble giant TV sets – crisscrossed the country, targeting areas with a high proportion of analog television households (NAB, n.d.). The

Figure 12.3 This “Digital Stations by DMA: Moving Toward the Switch” map reveals designated market areas with TV stations operating in digital before the transition. *Source:* NAB (01/07) The BRIDGE 2007.

DTV Trekkers ventured into 200 markets and made appearances at 600 events nationwide including state fairs, festivals, and sporting competitions. According to the project website, “The Roadshow schedule prioritizes areas with high over-the-air (OTA) density, attending events that help us reach those most affected by the switch, including minority / non-English speaking populations, older Americans, residents of rural areas, and economically disadvantaged populations.” (NAB, n.d.). DTV Trekkers ventured into areas across the country to draw attention to the DTV transition and to draw viewers into the DTV market.

Thus while coverage maps illustrated changing patterns of television distribution that occurred with the transition, they also facilitated direct marketing by companies that stood to benefit financially from it. Other trade organizations used the coverage maps as well. Since newly “out-of-range” viewers needed a higher-powered antenna to receive a signal, and since others were bound to experience reception problems, the Consumer Electronics Association (CEA) partnered with the NAB to develop a service that recommended antenna purchases based upon precise locational data. Endorsed by the FCC, the Antenna Web website, sponsored by the CEA and NAB, invites the user to enter an address and obtain antenna recommendations for that particular location. After the user enters a US address the interface offers a list of stations available in that market as well as a list of antennas that work best to receive the different signals. The website also provides a map of the location as well as optimum angles for antenna installation.

As Antenna Web collects information from consumers, it also shows the user the kind of pinpointed residence-specific information that the NAB and CEA already have. Indeed, the practices of the NAB and CEA are consistent with the kind of “interactive” media regime that appropriates consumer-citizens’ alleged freedom of choice in the marketplace as a mechanism for extensive consumer monitoring and profiling, a technological condition Mark Andrejevic (2007) refers to as the “digital enclosure.” As Andrejevic explains, the digital enclosure refers to “a space of universalized recognition and communication in which the places through which we move and the objects they contain recognize individuals and communicate with them” (p. 132). As Antenna Web offers its “services,” the website also publicizes the fact that broadcasters and consumer electronics manufacturers are able to recognize and communicate about TV reception practices at each known US address.

Despite how such interfaces and maps are used by corporations, they can serve as helpful visualizations for media scholars because they enable understanding of the spatial and territorializing properties of television infrastructure. Each PSA, map, or website is an attempt to translate largely imperceptible technical processes, which consumer-citizens are socialized to remain naïve about, into intelligible forms that can be interpreted and discussed. Still, while maps and interfaces can bring about greater infrastructural awareness, they also foster corporate encroachment upon citizen-consumers’ neighborhoods, homes, and devices, which are treated as sites of monitoring and market analysis. Many coverage maps are considered highly valuable intellectual property because they can be used to target underdeveloped markets and design media futures.

From TV Snow to White Space

When the DTV transition date rolled around on February 17, 2009, some viewers were eagerly prepared, perched at their analog sets with video cameras pointing at their TV receivers, waiting to record the last moments of their local stations’ analog signals as they disappeared forever. By March 4, 2009, there were 60 such videos posted on YouTube. These “end of analog kinescopes” not only document the termination of analog transmission at high-powered TV stations in the United States, they provide an interesting glimpse into the range of ways stations and viewers communicated about and understood the transition. One viewer in Iowa set up six television sets and let them run simultaneously so he could record which stations made the transition and which did not. Two of the monitors lost their signals, indicating they moved over to digital, and four others kept running in analog. While many stations across the country simply went off air (such as WEDU in Tampa Bay) and abruptly let the image turn to snow, some stations made a local news event out of the switchover and integrated it into their last analog evening news report. WGEM in Quincy, Illinois, for instance, had a reporter flip the “off switch” live as the station

Figure 12.4 On the day of the DTV transition, analog stations across the country ended their broadcast era with TV snow as they switched over to digital systems. Photo: Lisa Parks.

went “over to digital.” WDEF in Chattanooga provided a short station history featuring archival footage before signing off. WMTV-15 in Madison, Wisconsin, played the national anthem while a flag waved at the state capitol building and signed off with the familiar test pattern. And WSRE-23 in Pensacola, Florida, which typically ended its broadcast day with a photo of the sunset, had an announcer proclaim, “It’s the end of an era. From this point forward the sun will never set on our signal,” and ended not only the broadcast day but the analog era as the monitor turned to snow (see Figure 12.4).

Just as analog television’s inauguration was momentous, so too was its termination. These videos are important televisual timepieces that mark the end of a national broadcast system that operated for more than 50 years. It is an ironic coincidence that they were recorded similarly to that of early kinescopes, capturing what appeared on the television monitor during the signal’s transmission. As these videos chronicled this major infrastructural shift, they manifest a nostalgic and playful disposition toward analog television, expressing the kind of experimental and reflexive (modernist) sensibility found in earlier moments of television’s history. In *TV By Design* Lynn Spiegel (2008) suggests that “there was a high degree of visual experimentation on

early network television” and explores a “particular historical conjuncture when the visual arts and commercial television merged in unique and profound ways” (pp. 10, 18). The end of analog kinescopes resonate with this earlier fusion of visual arts and commercial television through their vivid capture of different stations’ final moments of analog transmission and viewers’ last glimpses of it and their clever way of documenting an infrastructural changeover.

Since many of the end of analog videos ended with images of TV static, noise, or snow, I want to suggest that they serve as apt icons or metonyms for this historic moment. If, as Spigel suggests, TV noise “became a metonym for all of television’s failures – proof that the medium could never be art” (pp. 179–180), then what can we make of TV snow? Even in its obscurity and abstraction, the image of snow manages to bring material conditions to the surface, evoking a series of technical, historical, and economic concerns. First, and most literally, snow communicates the technical reality of a broadcast interruption or failure. Since many stations ended their broadcast day by placing a test pattern, color bars, or station identification symbol in the frame until broadcast resumed in the morning, snow represented either a broadcasting break or system error. The second meaning is more temporal. Since snow will no longer appear on television after the digital conversion, it has become *the* symptom of a bygone era of broadcasting. In this way, snow represents a television infrastructure that once was and serves as a kind of master shot of analog television’s past. As such it can be said to evoke an infrastructural imaginary or way of thinking, a conjuring up of conditions that are broader and more dispersed than what appears in the frame. Finally, the last images of snow allude to the abandoned bandwidth in the electromagnetic spectrum, opened up with the changeover and sometimes referred to as “white space.” Numerous parties are interested in the future of this “white space,” and snow makes intelligible this part of the spectrum that is of great economic value and imminent regulatory concern.

Companies such as Google, Dell, Microsoft, Earthlink, Motorola, and Intel among others banded together to pressure the FCC to allow them to utilize this so-called “TV white space” to augment high-speed Internet connections and wireless broadband services (“The White Open Spaces,” 2007). White space is preferable for Wi-Fi transmissions because it operates at a lower frequency, can carry signals longer distances, and penetrates obstacles such as walls more easily than the high-frequency spectrum currently used for Wi-Fi. Two organizations – the White Space Coalition⁹ and the Wireless Innovation Alliance – formed to pressure the FCC to reallocate the part of the spectrum formerly used for analog broadcasting (TV channels 2–51 – 54–698 MHz) for use by unlicensed (TVBDs and WiFi – wireless) devices. In 2007 Google launched an advocacy project called “Free the Airwaves.com.” The goal of the initiative was to promote free unlicensed use of the spectrum space that formerly carried analog television signals. As Google declared on its public policy blog, “Today: TV Static, Tomorrow: Broadband” (Witt, 2007). Broadcasters opposed this move because such use could result in interference for licensed low-power broadcast stations still using part of this spectrum. Wireless corporations such as Verizon and

AT&T had already paid billions of dollars in auction fees for access to this part of the spectrum and were waiting to introduce new products that rely upon it (Stelter, 2009b). On November 4, 2008, months before the DTV transition, the FCC voted 5–0 to approve the unlicensed use of white space, thereby silencing opposition from broadcasters. Nearly two years later, on September 23, 2010, the FCC reinforced its position, approving new rules that paved the way for service providers and device makers to begin using the white space. FCC chairman Julius Genachowski predicted the new rules would lead to “Wi-Fi on steroids,” and proclaimed, “This new unlicensed spectrum will be a powerful platform for innovation [. . .] When we unleash American ingenuity, great things happen” (quoted in Reardon, 2010).

Significantly, the interests of low-income, elderly, and ethnic minority communities at the core of public discussions of analog television drop off the radar completely in those of the white space. These “free airwaves,” as they are referred to again and again, are envisioned as a mobile multimedia playground, ostensibly accessible to anyone, but ultimately restricted to those who can afford to purchase high-end mobile devices, subscribe to services, and acquire the knowledge to use them. Thus, while most have hailed the FCC’s white space policies as major victories, I suggest we need to remain a bit more skeptical, as these so-called free airwaves serve as reminders that the politics of taste, class, age, race, and gender are deeply embedded within quests for technological innovation and change. Google and other digital companies often use initiatives like “free the airwaves” in the public sphere as a way of diverting attention away from their profit motives and market domination, acting as agents of digital humanitarianism and performing services that the federal government can no longer afford to provide. Google’s efforts to “open up” the white space may not be so benevolent, however, and the company’s bold moves into the frontier of old analog television bandwidth may confirm Siva Vaidhyanathan’s (2011) provocative contention that we are undergoing the “Googlization of Everything.” While Google pressured the FCC to open analog television spectrum to unlicensed users, the company was also busy launching a product that would utilize it, Google TV. With pithy promotional taglines like “Television, meet search engine” and “There’s more on TV than television,” Google implies that the service will merge the capacities of the web, mobile telephony, and broadcasting so that viewers can put apps on the TV screen, use the mobile phone as a remote control, and “fling” content from mobile platforms to their TV sets.¹⁰ As Vaidhyanathan cautions, Google is not only “‘creatively destroying’ established players in various markets,” but “altering the very ways we see our world and ourselves” (p. 7). There will be no TV snow in a Googlized future.

Conclusion

The DTV transition serves as a meta-moment in US television history because it confronted us with so many manifestations of and questions about television itself.

Rarely have citizens-viewers been encouraged to think so carefully about how they get their signals and how their receiver works – to think so specifically about an object that is at once so familiar and so strange. This is a useful moment for several reasons. First, the infrastructural changeover led to an increase in the circulation of technical knowledge about television in the public sphere. The analog diehards, in particular, were addressed, lest they be left behind or remain beyond the digital enclosure (Andrejevic, 2007, pp. 2–3). The highly publicized DTV transition provided an opportunity for citizens to rethink their relation to television, consider its costs, and imagine it as more than a TV set. Some were confounded and frustrated by what they did not know and needed to know to get a clear signal. Others recognized that television is as much a public utility as it is a dream machine.

One effect of the DTV transition was that it could have catalyzed public interest in infrastructure more generally. The fact that technical knowledge about television infrastructure circulated in socially subordinated communities is significant. Unsightly or hazardous infrastructure sites are routed through the neighborhoods of the working poor, the elderly, and ethnic minorities in much greater proportion than in affluent communities in the United States, and hence there are political implications to the circulation of technical knowledge about such systems. Since television provokes so much affect, it may be a useful site for catalyzing further public interest in other vital infrastructures equally important in our environment, whether levees, gas pipelines, cell phone towers, or sewer systems.

Second, the DTV transition revealed how deeply and profoundly the US commercial television industry pivots upon the Nielsen ratings system. That this system, based on such a small sample, remains the driving force of so much strategizing and decision-making in the industry seems absurd given the multiple ways viewers now engage with television in the context of its digitization. The traditional model of the Nielsen home has been compounded by television's distribution through various platforms including cable, satellite, mobile telephony, the web, and DVD. While the proliferation of distribution platforms and the variety of viewing practices they support raise major questions about the viability of Nielsen ratings, they are still treated like an industry gold standard. Indeed, it was the prospect of losing viewers, and thus sponsors, that motivated broadcasters to lead the DTV transition. How would US television change if Nielsen ratings were removed from the picture? The reality is that comprehensive systems of consumer monitoring, measurement, and profiling have become so naturalized and hardwired within everyday environments that they make the Nielsen ratings look like child's play. As a result it is increasingly difficult to separate the meanings of infrastructure from practices of consumer monitoring and profiling.

Finally, the idea that opening the white space will lead to a media future of "Wi-Fi on steroids" raises questions about the dominant logics that underpin technological innovation. While the tendency is to assume that television will be replaced with "smart media," if the DTV transition has shown us anything it is that many people in the United States were deeply connected to and satisfied with the system of free

over-the-air analog television despite the availability of “better” services. The DTV transition’s fetishization of innovation, manifest in the fixation on a crisper picture, occluded the reality that many people did not need or want DTV and suggested that broadcasters were glaringly out of touch with the ways that many US citizens think about, watch, and use television. In a discussion of television’s low picture quality relative to film, Raymond Williams (2008) observes, “most people have adapted to this inferior visual medium, in an unusual kind of preference for an inferior immediate technology, because of the social complex – and especially that of the privatised home – within which broadcasting, as a system, is operative” (p. 22). While the proliferation of distribution platforms and the digitization of signals certainly have the potential to shift television’s social complex beyond the home, the DTV transition revealed that many viewers remain deeply entrenched within it. The point is that we cannot allow corporate and FCC quests for technological innovation, whether articulated as Google TV or “Wi-Fi on steroids,” to determine critical investigations of television’s transitions. As Raymond Williams reminds us, “there were, in the abstract, several different ways in which television as a technical means might have been developed” (p. 22). Television will not simply be substituted with “smart media.” It will be reinvented (as it has been many times in the past) across changing infrastructures and platforms and local, national, and global sites. This means it is more important than ever to bring interdisciplinary, international, and relational thinking to the future study of it.

ACKNOWLEDGMENTS

I began writing this essay while I was the Beaverbrook Scholar-in-Residence at McGill University in Montreal in March 2009. I am grateful for feedback I received while delivering the paper at Concordia University in Montreal, Stockholm University, and the Annenberg School at USC. I would also like to thank Kelly Gates for helpful feedback and Meredith Bak for research assistance.

NOTES

- 1 Paul Virilio’s notion of a “logistics of perception,” which accounts for the accelerated speeds and vast distances of contemporary (militarized) communication systems, can be helpful in considering infrastructural processes and the impossibility of merely “seeing” them. See Virilio (1989).
- 2 The term, which has been used in English since at least 1927, means “the installations that form the basis for any operation or system.” See <http://www.etymonline.com/index.php?term=infrastructure>

The 800-Pound Gorillas in the Room

The Mobile Phone and the Future of Television

Max Dawson

ABSTRACT

Since the late 1990s media and telecommunications companies have invested billions of dollars in the development of methods for delivering television programming to mobile phones over wireless networks. In this chapter, Max Dawson explores the institutional conflicts that have shaped mobile television's development in the United States, paying special attention to the clashes that have taken place between mobile companies and broadcasters. For nearly a decade these adversaries have made mobile television a weapon within ongoing disputes over markets, resources, and policies. These conflicts have produced a succession of mobile television solutions that have emulated, reworked, and commented upon the technologies and protocols of the US model of over-the-air television broadcasting. Dawson argues that mobile television's remediation of broadcasting is neither incidental nor ironic, but rather is indicative of the institutional politics that surround emergent media. He situates mobile television's remediation of broadcasting within these political contexts, and in the process highlights the institutional factors that influence processes of media change.

Both wireless carriers and entertainment companies are used to being the 800-pound gorilla in any room. Now that they're in the same room, something has to give.

Kanishka Agarwal, Vice President of Mobile Media, Telephia
(quoted in Kapko, 2007)

If you thought UHF had gone the way of eight tracks and Betamax, think again. The broadcast spectrum could be the future of television.

Om Malik (2005)

To publicize the June 2007 debut of its latest mobile phone, the consumer electronics giant LG hosted a party “celebrating the past, present and future of television” at Paramount Studios in Hollywood, California. The small-screen theme of LG’s Mobile TV Party was a nod to the new phone’s defining feature: inside the LG VX9400 was a chip that enabled it to tune in specially encoded live television signals transmitted over a vacant channel in television’s UHF (ultra-high frequency) band. Joining LG in celebrating the phone’s launch was a bevy of “TV icons,” including *The Brady Bunch*’s Chris Knight, *Star Trek*’s George Takei, and *Happy Days*’ Scott Baio. After walking the red carpet, LG’s guests made their way through a museum-style exhibition of television technologies that began with black-and-white receivers and culminated with the VX9400. This exhibition, which LG dubbed the “living timeline of television history,” opened up onto a massive soundstage on which had been erected scale reproductions of the sets of some of the best-loved programs of the 1960s and 1970s. For the rest of the night partygoers mingled within a recreation of the Brady family’s living room, posed for photos in the captain’s chair of the Space Shuttle *Enterprise*, and dined on cheeseburgers and shakes in Arnold’s Drive-In (Fathom4, 2007).

LG’s placement of the VX9400 at the conclusion of the “living timeline of television history” translated into spatial terms an argument advanced by many in this period: that mobile devices were “the future of television.”¹ The Mobile TV Party’s retro theme and guest list, however, made it difficult to ignore the many parallels between this vision of television’s future and the medium’s past. Like the black-and-white receivers that greeted partygoers at the entrance of the “living timeline,” the VX9400 featured a tiny, low-resolution screen, used an antenna to receive a handful of channels that aired fixed schedules, and lacked the ability to record, pause, fast forward, or rewind programming. In many respects, this “television of the future” owed more to the 1950s nostalgia sitcom *Happy Days* than it did to the fantastic world of *Star Trek*. For aside from its portability and \$15 dollar a month subscription fee, there was little to distinguish mobile television from the broadcast television that *Happy Days*’ Cunningham family would have enjoyed within the comfort of their living room in 1950s Milwaukee.

LG was by no means alone in promoting the notion that television’s future would involve the revival of broadcasting by mobile media companies. During the 2000s consumer electronics manufacturers, mobile communications companies, broadcasters, Internet companies, and global media conglomerates poured billions of dollars into the development of technologies for delivering television programming to mobile

phones and other portable devices. The first mobile television solutions to emerge from these ventures were patterned after early Internet video platforms and used mobile carriers' voice networks to transmit television programming on an on-demand basis. As the decade progressed, however, mobile television's backers doubled down on their investments in technologies that emulated or refashioned aspects of broadcast television. These solutions, which included Crown Castle Communications' Modeo, Aloha Partners' Hiwire Mobile Television, Texas Instruments' Hollywood mobile digital broadcast platform, mobile DTV, and Qualcomm's MediaFLO (the technology that powered LG's VX9400), moved mobile television signals off of carriers' voice networks and onto portions of the radio spectrum that had until recently been occupied by television broadcasters. Each system capitalized on the latest advances in video compression, radio spectrum optimization, power consumption minimization, and mobile chip design to accomplish something that television broadcasters had done quite well since the 1940s: deliver multiple channels of linearly scheduled programming over the air and in "real time" to an unlimited number of viewers located within a defined geographic area. Mobile television's backers have not dodged these comparisons with television's past, but rather have invited them. Via their product designs, programming strategies, and promotional texts they encouraged reporters, regulators, and consumers, often explicitly, to regard mobile television as an extension of and improvement upon the technologies and practices of broadcasting.

The "irony" that the developers of these "futuristic" mobile technologies should aspire to emulate broadcasting at a time when fewer than 10% of US viewers received their television signals over the air was not lost on contemporary observers. In a review of one of the many commercial mobile television services introduced in this period, a *Chicago Tribune* reporter acknowledged with a smirk that mobile television was "a bit like TV in the '70s: no VCR-style recording, only eight channels, and in some areas you'll have to raise the phone's antenna to improve reception" (Gwinn, 2007). Media scholars have likewise taken note of the various ways that mobile television adopts, reworks, and comments upon – or, in the terminology of media theorists Jay David Bolter and Richard Grusin (2000), *remediates* – the technologies and protocols of broadcasting. Studies published in recent years have detailed the parallels that exist between mobile television programming and the heavily segmented formats that predominated on US network television in the late 1940s; between mobile phones' tiny screens and the playing card-sized cathode-ray tubes of early television receivers; and between the promotion of mobile television in the 2000s and of portable television receivers in the 1950s and 1960s (Carey & Greenberg, 2006; Dawson, 2007; Groening, 2010; Orgad, 2009).

Why have the backers of mobile television, an emergent medium touted by many as "the future of television," so aggressively sought to revive the residual protocols of broadcast television? What are the factors that motivated the shift from the on-demand paradigm of the United States' first mobile television services to technologies that behaved more like conventional broadcast receivers, and services that offered fixed daily programming schedules? And what are the larger implications of

this paradigm shift for media industries, policies, and audiences? This chapter takes up these questions, exploring the overdetermined contexts and consequences of mobile television's remediation of broadcasting in the United States. It argues that the anachrony of mobile television is more than just an "ironic" historical curiosity or a marketing strategy employed to familiarize a novel technology. Rather, mobile television's remediation of broadcasting must be understood within the context of broader institutional conflicts that predate the advent of technologies capable of delivering television to mobile phones. For nearly a decade the adversaries in these lengthy conflicts used mobile television – or, more accurately, the *prospect* of its widespread adoption in the near future – as a weapon within fights over resources and policies. In fact, many of the conflicts over mobile television had less to do with the technology itself than with the terms under which these adversaries would compete and collaborate with one another in the future in media markets that had yet to be established or defined. And yet despite these adversaries' mutual preoccupations with positioning themselves for this uncertain future, both sides have gone out of their way to assert the links between television's broadcast past and mobile future. In these fights between "new" and "old" media industries, anachrony proved equally effective as a rationale for change as it did an argument against it.

The following sections offer a sketch of the sides within and stakes of the conflicts that have shaped – and continue to shape – mobile television, paying special attention to the clashes between mobile communications companies and broadcasters. The war between these two "800-pound gorilla[s]" has been waged on multiple fronts, and has involved shifting configurations of temporary alliances with various other stakeholders (Kapko, 2007). It is not the only conflict that has influenced mobile television's development, yet it is the one that has most impacted peripheral skirmishes over technical standards and programming formats; content licensing agreements; hardware and monthly subscription pricing; and the division of costs and profits amongst producers, distributors, and various middlemen. By examining the contexts of this particular conflict, this chapter identifies mobile television's remediation of broadcast television as an institutional practice. Within the field of new media studies, the concept of remediation is most often employed to describe the interaction of the artifacts, forms, social practices, and modes of perception associated with multiple media. Mobile television's brief history in the United States highlights another dimension of remediation: the interactions of corporate cultures, business models, ideologies, traditions, and reputations that take place when institutions and industries are thrust together by technological convergence and regulatory reform.

The Uncomfortable Proximity of Convergence

Although the "jurisdictional conflicts" that have surrounded mobile television are "complex and multisided" (Altman, 2005, p. 22), the factors that initially provoked

them may nevertheless be conceptualized in rather straightforward spatial terms. In brief, the primary adversaries in these conflicts were stakeholders who in the 2000s found themselves in close and oftentimes uncomfortable proximity to one another, first within the marketplaces in which they operated, and then later within the progressively cramped quarters of the nation's radio spectrum.

As Carolyn Marvin (1990) argues, the public launch of a new medium often involves the rearrangement of physical and/or social spaces, and may alter the literal and figurative distances between groups engaged in negotiations over "power, authority, representation, and knowledge." "New media," she writes, "intrude on these negotiations by providing new platforms on which old groups confront one another. Old habits of transacting between groups are projected onto new technologies that alter, or seem to alter, critical social distances" (p. 5). Marvin's observations about new media and the uneasy proximity they may engender pertain specifically to relationships between and amongst a medium's various cohorts of users. But they are equally relevant to institutions' and entire industries' "habits of transacting." The introduction of a new medium may destabilize the customary terms governing competition and collaboration within various markets, altering the balances of power that such customs typically maintain. For this reason hegemonic institutions often find it in their collective best interests to actively or indirectly impede the dissemination of innovations that alter the distances between industries and/or markets (Winston, 1986).

Between the 1980s and the 2000s, the distances separating participants in telecommunications and media markets contracted quite dramatically in the United States. These entities' new proximity recalled a much older arrangement of the "spaces" of US telecommunications and media markets, namely that which existed during the first two decades of the twentieth century, when the infrastructure and the institutions of telephony, telegraphy, and broadcasting were all thoroughly integrated. The reunification of the US telecommunications and media industries was a gradual process, but was sped along in the end by digitalization, and specifically by the refinement of methods for distributing digitized voice communications, Internet Protocol packets, and video over the same wired and wireless networks. The technological integration of media and telecommunications distribution infrastructures encouraged and facilitated the flow of capital, intellectual property, personnel, expertise, and business models between companies. For decades, these companies had collaborated under a collection of formal and informal rules that were quite specific about the division of their roles and the limits of their respective jurisdictions. But as these flows have intensified, and as cross-industry mergers have grown more common, these rules have become easier to ignore. As the 1990s wore on, customary distinctions between, for instance, phone companies, cable television multiple service operators (MSOs), and Internet service providers grew more and more blurry and less and less binding.

As infrastructural integration gained momentum in the 1990s, prominent libertarian cyberboosters and high-tech industry executives prophesied the imminent and

inevitable reunification of the telecommunications and media markets (Gates, 1995; Gilder, 1990, 2000). However, industrial convergence was not, as its most vocal proponents insisted, a logical and necessary outcome of infrastructural integration, but instead a product of legislative intervention. The comprehensive policy reforms enacted by the United States Telecommunications Act of 1996 formally ended the enforced segregation of telecommunications and media markets. Though it would be a number of years before viable cross-industry competition occurred, by the mid-2000s companies such as Comcast and AT&T had expanded their services to include “triple play” packages that bundled together voice, video, and broadband Internet services.

In addition to removing policy obstacles to cross-platform competition, the reforms of the 1990s created conditions amenable to the reconsolidation of United States telecommunications markets, which since the breakup of the Bell System monopoly in the 1980s had been compartmentalized by region and platform (Fotheringham & Sharma, 2008, p. 200). Amongst the biggest beneficiaries of these reforms were mobile communications companies, and in particular the operators of nationwide mobile phone networks. In the 1990s the United States’ major mobile network operators embarked on an acquisition spree, swallowing up smaller regional competitors, long-distance and local fixed-line telephone companies, and retail Internet service providers. By the mid-2000s, the mobile communications retail market was dominated by four major networks: Verizon Wireless, AT&T Mobility, Sprint Nextel, and T-Mobile.² The first two of these networks were subsidiaries of massive telecommunications conglomerates with portfolios that included fixed-line and mobile telephone services, wholesale and retail Internet services, and, by the mid-2000s, multichannel television services.

The United States’ four major mobile network operators benefited from massive economies of scale and, in the case of Verizon Wireless and AT&T Mobility, cross-platform synergies, such as the ability to bundle their mobile services along with their parent companies’ “triple play” packages (Fotheringham & Sharma, 2008, p. 15). However, these companies came into existence at a particularly challenging time for the mobile communications industry. By the early 2000s, the retail market for mobile communications services began showing the first signs of saturation (Nuechterlein & Weiser, 2005, p. 260). With a dwindling number of potential new customers available to them, mobile network operators turned their attention to luring subscribers away from their competitors. The fierce competition that ensued sent voice call revenues – “the flywheel” of the industry’s growth over the previous two decades (Fotheringham & Sharma, 2008, p. 206) – into decline, placing mobile network operators – and their voice-centric business model – in a “precarious” position (Charny, 2004; Nuance Communications, 2006).

To stave off the industry-wide slowdown predicted by many telecommunications analysts, mobile network operators diversified, introducing an array of premium-priced data services in the early 2000s that included text messages, web browsing and email, adult services, videogames, and music and ringtone downloads. In conjunction

with the rollout of these services, operators invested heavily in network upgrades, including the construction of third-generation (3G) mobile networks designed to provide faster data transfer rates. The first of these premium services to pay off was text messaging, which generated \$2.5 billion for the mobile telecommunications industry in 2004. But network operators had their eyes on the even bigger potential windfall represented by multimedia services, and mobile television in particular. Mobile television services had recently been introduced by mobile network operators in Europe and Asia, and even in their embryonic stages these services made a significant impression upon North American telecommunications analysts. Between handset sales, subscription and data transmission fees, premium pay-per-view charges, and advertising, mobile television presented network operators, as well as chip makers, consumer electronics manufacturers, and media companies, with an impressive range of revenue opportunities. Optimistic analysts predicted that mobile television could replace voice communications as the mobile phone's "killer app" (Goot, 2003; Hellweg, 2005), and forecasted that it would generate between \$6 and \$27 billion annually by the end of the decade (Reardon, 2006).

For mobile network operators locked in cutthroat competition with one another over shrinking voice margins, mobile television's multiple revenue streams represented a promising solution to the dilemma of how to maintain growth in a decelerating marketplace. As reported by the technology website CNet, by 2004 enthusiasm for mobile television had grown to the point where some mobile industry executives were publicly claiming that mobile television's revenues would "save the cell phone industry" (Charny, 2004). But mobile television also represented a potential bridge to a future in which mobile network operators would no longer be solely or even primarily in the business of voice communications. By adding television packages to their lists of services, the United States' mobile network operators began the process of reinventing themselves as fully diversified entities that would compete in multiple media markets, as opposed to exclusively with one another.

"The Future of Broadcast Television is Mobile"³

Mobile network operators' multimedia ambitions led them into new markets, as well as into new portions of the radio spectrum. In these spaces they encountered old partners under new circumstances, as well as institutions that they had limited experience in dealing with. Amongst the latter were broadcasters, a group that shared mobile network operators' interest in the possibility of delivering television programming to mobile devices.

Whereas mobile network operators' multimedia ambitions were driven in large part by their industry's growth imperatives, broadcasters' interests in mobile television were survival oriented. The period of the mobile industry's rapid growth coincided with the unraveling of the hegemony of US network broadcasting (Lotz, 2007). As mobile network operators' subscriber rolls expanded, US broadcast

networks' cumulative share of the national television audience fell precipitously, from approximately 75% in 1985 to 43% in 2010 (Seidman, 2007). Broadcasters' advertising revenues followed this downward trend, spurred by the ascendance of cable, the advent of new commercial-skipping technologies such as the digital video recorder (DVR), and the recessions that bookended the first decade of the twenty-first century. National broadcast networks' local affiliate stations were particularly hard hit by the industry's economic downturn. While most of these stations continued to be profitable, their future viability became a subject of much debate within the popular press and within the industry itself (Schechner & Dana, 2009). Questions about the sustainability of free-to-air broadcast television were broached with increased frequency (and urgency) in the press during the 2000s. A 2006 IBM Business Consulting Services report captured the pervasive sense of crisis surrounding broadcast television in this period. "Today is the beginning of 'the end of TV as we know it,'" the report explained, "and the future will only favor those who prepare now" (IBM Institute for Business Value, 2009, p. 1). Amongst those not expected to survive this paradigm shift were broadcast stations, which, as one journalist put it, appeared to be "head[ed] for extinction" (Wasserman, 2004).

As these debates over television's future – and free-to-air broadcasting's lack of one – unfolded, the owners of the nation's more than one thousand broadcast television stations did as the mobile network operators discussed above and began to explore alternatives to their traditional business models and revenue sources. The range of options available to them was more diverse than ever before, thanks again to legislative intervention. As discussed by Lisa Parks in her contribution to this volume, during this period every local broadcast station in the United States was required to convert its facilities to the nation's new digital television broadcasting standard, or DTV. When crafting the rules governing this changeover, the Federal Communications Commission (FCC) had been extremely charitable toward free-to-air broadcast stations. In addition to granting each station what essentially amounted to a rent-free lease on a second channel for the duration of the conversion (allowing them to simultaneously transmit in analog and digital), the FCC also refrained from placing stipulations on how stations would use their digital channels. Stations were at liberty to use these channels as they saw fit, provided they continued to offer at least one free-to-air channel that adhered to the vague public interest principles that govern the licensing of free-to-air broadcasting in the United States.

The potential uses of these new digital channels were many, and included high-definition broadcasting, multiple channels of standard-definition broadcasting, subscription channels, wireless data services, or mobile television transmission. While the majority of local stations elected to use their digital channels to transmit high-definition video, mobile television held a particularly strong appeal for broadcasters (Dickson, 2007a; Whitney, 2009). Having initially been shut out of the deals that broadcast networks struck with companies such as RealNetworks, Apple, and Google to deliver their programming via the Internet, station owners appreciated the opportunity that mobile television presented to directly tap into a new and potentially lucrative revenue stream (Dickson, 2007b). Broadcasters' investments in

mobile television also promised the return of substantial symbolic dividends. By insinuating themselves into the incipient mobile multimedia market, broadcasters stood to *remediate* their own and their industry's reputations at a time when both were suffering. Bolter and Grusin (2000) contend that remediation often entails the reform (or more precisely, the *rhetorical* rehabilitation) of one medium by another, as when a new medium's promoters present it to the public as an improvement or upgrade on an already established medium. They write: "Each new medium is justified because it fills a lack or repairs a fault in its predecessor, because it fulfills the unkept promise of an older medium" (p. 60). Although the very possibility of this reform is predicated upon an acknowledgment of the perceived inadequacies of an older medium, as an institutional practice remediation may also involve the rehabilitation of an older medium's tarnished reputation. Material and/or figurative associations with new media may imbue established media with a sheen of novelty, and may even provide new justifications for their existence. Through these associations, "old media" may shed their customary uses or their sedimented cultural meanings, in a sense becoming "new" once again.

In the case of mobile television, the nation's beleaguered broadcast industry had much to gain from an association with the mobile communications industry, which despite having its own economic problems nevertheless continued to enjoy a reputation for innovation within policy circles, the investment sphere, and public opinion. The pressures on broadcasters to reform their industry's image were particularly acute during this period. The steady stream of popular media reports forecasting the impending demise of free-to-air broadcasting placed the national networks and their affiliate stations in a position in which they were continuously required to justify their relevance. Another source of pressure originated from within policy circles. The costly and protracted conversion to DTV exacerbated anti-broadcasting sentiments that had been percolating within think tanks, academic departments, and media watchdog organizations for quite some time by this point.⁴ Local stations' repeated failures to comply with the deadlines specified by the FCC's conversion timetables resulted in the postponement of the commission's reclamation of analog television's portion of the radio spectrum. These delays prolonged stations' rent-free leases on their second channels, blocking the transfer of the analog television spectrum to the mobile communications companies and public safety organizations that had obtained the rights to occupy it following the conversion's completion.

The economic and public safety ramifications of these delays resulted in a wave of negative publicity for the broadcast industry as would-be users of the spectrum joined policy experts and media activists in demanding a reexamination of the terms under which the FCC licensed broadcast stations. Some proponents of reform made more radical recommendations, which included, for instance, "Tak[ing] TV off the air" and reallocating its spectrum to more "efficient" or "intelligent" uses (San Miguel, 2008). The crux of many spectrum reformers' arguments was that broadcasters – a group that, according to one critic, had grown so complacent that "its idea of a major innovation is the miniseries" (Platt, 1997) – were squandering the immense value of

one of the nation's most important and valuable resources. Signals transmitted in television's portion of the radio spectrum travel long distances and are capable of passing through walls and other obstructions, making them attractive for a wide variety of uses, and extremely valuable on the open market. Proponents of spectrum reform estimated the cumulative market value of broadcasters' spectrum holdings to be upwards of \$60 billion, and projected that in the hands of more "innovative" users this spectrum could generate an additional \$1 trillion in benefits for the country in the future (Eggerton, 2009). As the DTV conversion dragged on, and as the US economy sunk into recession, proponents of spectrum reform found support for their platform within the FCC and the White House. Following the election of President Barack Obama, who had pledged during his campaign to make the universal provision of broadband Internet access a priority of his administration, the FCC began formal investigations of the feasibility of reallocating spectrum from broadcasters to mobile companies and other new users.⁵

Under pressure to demonstrate to an increasingly unsympathetic policy community and public their worthiness of the choice spectrum they occupied, the nation's broadcast station owners scrambled to ready a free-to-air "mobile DTV" standard that would enable them to simulcast their channels to handheld devices. Though for the time being mobile DTV remained "vaporware" – that is, a product that is under development and thus exists only conceptually or in a prototype stage – this did not stop broadcasters from trying to sell the public and the policy community on its importance. John Caldwell (2000) describes the routine practice of promoting vaporware as "both a corporate theoretical exercise and a marketing high-wire act" (p. 6). Broadcasters in this period busied themselves with both activities, working on the one hand to stoke anticipation for a product that was still years away from being ready for the market, and on the other hand to establish a theoretical framework through which to understand the future of US media. This theoretical framework was buttressed by the structuring ideologies of free-to-air broadcasting, which since the early twentieth century have included localism, liveness, and public service (Boddy, 1990).

In various speeches, public service announcements, and press releases, industry lobbying groups such as the National Association of Broadcasters (NAB) and the Open Mobile Video Coalition (OMVC) made the case that this vaporware represented the best bet of ensuring these cherished principles' survival in the "digital future" (Whitney, 2005). Apart from reasserting their members' commitment to free-to-air broadcasting's structuring ideologies, these groups also highlighted the important contributions a healthy and innovative broadcasting industry would make to this future. For instance, a 2010 press release issued by the OMVC stated that:

The emerging Mobile DTV platform is the natural evolution of television and is an indispensable part of the nation's broadband solution. In the public policy debate over spectrum allocation, we urge Congress and the FCC to carefully consider the essential role Mobile DTV can play as a resource for emergency alerts, as a source for vital public information, and as an ingredient in the country's broadband future. (RBR, 2010)

The broadcasting lobby's defensive maneuvers played liberally with linear chronology: by hyping a throwback mobile DTV standard that was not yet ready for commercialization, broadcasters made retro vaporware a central element of their efforts to rhetorically create for themselves and for their industry the future that their critics and competitors argued they lacked. But despite the assuredness that characterized these lobbying campaigns, a sense of desperation persisted around mobile DTV, growing stronger as its development dragged on. As one trade journalist observed, "Mobile DTV provides a means for broadcasters to remain relevant in the 21st century. That's important, for if broadcasters don't use their spectrum efficiently to serve the majority of the population, there are many other companies out there willing to pay a high price for that spectrum" (Lung, 2009). Amongst the many groups circling broadcasters' spectrum were mobile network operators, whose own multimedia ambitions hinged upon their annexation of television's airwaves.

Emergent Technologies, Residual Protocols

During the 2000s broadcasters and mobile communications companies each identified mobile television as key to their respective industries' futures. At least initially, agendas shaped by distinctive institutional cultures, industrial legacies, and technological considerations led these two groups to pursue diverging mobile television solutions. However, the multimedia ambitions of the mobile communications industry and the survival tactics of free-to-air television broadcasters would, over time, place these two industries on a collision course. By the end of the decade, broadcasters and mobile companies' preferred methods of delivering television programming to mobile devices shared a number of attributes in common. Though these methods continued to employ incompatible transmission and reception *technologies*, the user experiences they offered were similar in that they both owed much to the *protocols* of free-to-air broadcast television.

The basis for this distinction between mobile television's technologies and protocols is Lisa Gitelman's (2006) proposal that the term *medium* be understood as encompassing both technological instruments and the "vast clutter of normative rules and default conditions [...] which gather and adhere like a nebulous array around" them (p. 7). As defined by Gitelman, *protocol* is a flexible category encompassing a medium's uses, business models, the forms its content or messages take, the standards and regulations governing its implementation, and even ideas about its cultural meanings. Though protocols have a tendency to sediment and become inertial beneath the encrustations of common sense that surround them, they remain sensitive and dynamic. Protocols may change in response to technological developments, as when the introduction of a new technology prompts the reappraisal and revision of a medium's extant regulations. But they may likewise be influenced by a much wider range of "changeable social, economic, and material relationships" (p. 8), including

the institutional practices of remediation described above. In its efforts to reform its own identity or reputation, a broadcaster, a mobile network operator, or any other institution may remediate the protocols of other media and other institutions. Protocols are in this respect *intermedial*, and register the shifting dynamics of power and status that play out in the interactions between media institutions.

The mobile television solutions explored by mobile communications companies illustrate the complex and unpredictable ways that media institutions remediate one another's protocols. For as greatly as mobile technologies have changed since US mobile network operators first began carrying television programming over their networks, mobile television's *protocols* have undergone equally dramatic transformations. The protocols that have so far taken shape around mobile television are schizophrenic and unstable, and remediate practices, forms, regulatory frameworks, and social and financial arrangements associated with broadcast and cable television, mobile telephony, and personal computers and the Internet.

The first services that used mobile networks to deliver television-like video content to US mobile phones debuted in 2003. That year, Sprint and AT&T Wireless began loading a selection of their top-of-the-line phones with software that allowed customers to access a rotating selection of about 100 on-demand video clips, many of which were sourced from broadcast television networks. Provenance notwithstanding, RealOne Mobile's video clips resembled Internet slide shows more than they did television. Due to the limited processing power of handsets and the bandwidth constraints of existing mobile networks, clips ran at between 1 and 4 frames per second (as opposed to television's 30 frames per second). Even then, similar to Internet video sites, RealOne Mobile's streams were prone to frequent buffering, pixilation, and losses of synchronization between their audio and video tracks.

If the poor picture quality of RealOne Mobile's television clips evoked the visual culture of the Internet, so too did many of the other protocols that coalesced around this and other mobile multimedia services in this period. RealOne Mobile was a mobile version of RealNetworks' RealOne GoldPass, a subscription-based multimedia service that delivered a similar selection of short television clips, as well as streaming music, radio stations, and movie trailers, via the Internet to personal computers. As RealOne Mobile was joined in the fledgling mobile television market by Verizon V Cast, ESPN Mobile, Amp'd Mobile, and Cingular Video, many of these services adopted the monthly subscription fees, clip-based content libraries, and on-demand delivery methods of Internet multimedia services. Institutional protocols were passed between Internet and mobile multimedia ventures as well – for instance, mobile television preserved the convention of third-party companies serving as aggregators of other distributors' programming. In the case of RealOne Mobile, RealNetworks acted as an intermediary between two very different types of distribution networks, licensing content from television networks and then subsequently processing and packaging that content for redistribution via mobile phone networks.⁶

The protocols that RealOne Mobile and other fledgling mobile television aggregation services inherited (or appropriated) from their Internet counterparts hybridized

with the normative rules and default conditions of the US mobile communications industry. Until recently, the United States' major mobile companies ran their networks as "walled gardens," placing restrictions upon the hardware and software their subscribers could use and the content they were permitted to access. The cornerstone of the walled garden was the subsidized handset. To entice prospective customers to enter into these "enclosures," operators offered deep discounts on mobile phones. These discounts came with two major conditions: first, customers were required to commit to a contract of a specified duration (typically 24 months); and, second, network operators modified these subsidized phones so that they worked only on their networks.

Early mobile television services replicated this business model. Network operators made available a selection of subsidized multimedia handsets loaded with software that allowed them to receive television clips and other forms of multimedia content, but only from aggregators with whom operators had standing compacts. These restrictions allowed network operators to manage their subscribers' use of multimedia services, for instance by blocking access to the Internet and its bandwidth-intensive free video sites. They also meant that all transactions between mobile television viewers and aggregators were conducted within networks' walled gardens, putting network operators in positions to negotiate arrangements in which they would be paid by both parties.

What kinds of programming could subscribers watch after signing up for one of these "walled garden" services? Much of the video content available on mobile phones during this period was repurposed from broadcast and cable television. Apart from one service that delivered a selection of 12 streaming television channels with fixed schedules, most mobile multimedia packages were dominated by short television clips presented on an on-demand basis. The most common sources for these clips were heavily segmented television formats, including news, late-night talk shows, sketch comedy series, sports highlights, and entertainment reports (Dawson, 2011). For instance, Verizon V Cast debuted in 2005 with a programming lineup that included brief highlights from *The Daily Show*, *Entertainment Tonight*, and ESPN's *Sportscenter*. Go TV presented abridged versions of weekly episodes of ABC's *Desperate Housewives* and *Alias*, while Sprint Vue featured clips culled from a selection of current and classic CBS programs, including *CSI* and *I Love Lucy* (Dawson, 2011). Though there was a great deal of talk in this period about creating short-form programming geared specifically to the small screens and limited processing power of mobile handsets, original content – that is, content not recycled from television – was scarce (Dawson, 2007). Rare exceptions included made-for-mobile spinoffs of popular prime-time television series: for example, Verizon licensed a series of minute-long "mobisodes" based on the Fox drama *24* for its V Cast service, while Cingular Video included a premium HBO "channel" featuring an exclusive *Entourage* miniseries.

Though most of the programming available from these services was sourced directly from broadcast and basic cable television networks, or else based on popular television franchises, the most direct influence on this programming's presentation remained the

protocols of early Internet multimedia services. By 2005, however, these protocols were themselves being overhauled, with the subscription-based models pioneered in the late 1990s by aggregators such as RealNetworks giving way to the “Web 2.0” model exemplified by the video-sharing website YouTube. In contrast to aggregators like RealOne GoldPass, which sourced content directly from television networks, record labels, and movie studios, YouTube operated a free video hosting service that initially relied exclusively on site visitors (and creative interpretations of “safe harbor” copyright exemptions) for content. Within a rather short period of time YouTube was joined in the web video marketplace by a number of startups that also combined free hosting services with social networking platforms. Like YouTube, these sites were free, device- and platform-agnostic, and encouraged user participation via uploading, tagging, commenting, embedding, and sharing features.

The explosive growth of YouTube and its competitors inspired an avalanche of press coverage, with some contemporary commentators identifying these sites as a harbinger of an entertainment “snacking” trend that would transform how popular media was made, distributed, and consumed (Miller, 2007). Mobile network operators were eager to capitalize on this trend, and in advertisements and other publicity materials positioned the mobile phone as the ideal “snacking” platform. They also pursued partnerships with video hosting websites: in 2006 Verizon Wireless signed a deal with YouTube granting it exclusive rights to distribute clips from the site via its V Cast multimedia service. But in keeping with the mobile industry’s “walled garden” business model, Verizon made only a curated selection of YouTube’s clips available to its subscribers. Though Verizon Wireless and other mobile network operators dabbled in the snack marketplace, most stopped well short of allowing their subscribers to venture outside of their “walled gardens” to graze at the Internet’s all-you-can-eat video buffet. Ultimately, mobile network operators were reluctant to embrace the changes Internet video’s protocols underwent during this period, in part because the “openness” these protocols aspired to was so incongruous with the concept of the “walled garden.”

As YouTube’s Web 2.0 model achieved hegemonic status online, mobile network operators found new templates for the protocols of their mobile television services in “old” media. From 2007 onward, mobile network operators began phasing out clip-based mobile television services’ on-demand protocols in favor of ones that more closely resembled those of free-to-air broadcast television. On-demand services transmitted separate signals to each individual viewer over mobile networks using a method known as “unicasting.” By contrast, the second wave of mobile television technologies employed a “multicasting” distribution model to simultaneously transmit a selection of between 8 and 14 preprogrammed linear channels that, depending on the network, might include NBC, Fox News, Adult Swim, Nickelodeon, and the Disney Channel. Although these services’ daily schedules were adjusted to reflect mobile television’s peak viewing times – the morning and afternoon rush hours – the programming lineups they offered were for the most part identical to those airing on broadcast and cable television.

Technical dilemmas posed by clip-based mobile television were a major motivating factor behind the development of multicasting technologies. For although mobile television services' subscriber numbers remained well beneath telecommunications analysts' sunny projections, it soon became apparent that existing mobile networks were not up to the task of delivering television programming to large audiences on a unicast basis. Within two years of the launch of unicast mobile television, analysts were warning that even a modest bump in viewing could overwhelm the nation's mobile networks (Reardon, 2005). The troubles experienced by the South Korean mobile network operator SK Telecom provided a preview of what might be in store if these projections panned out. In 2002 SK Telecom had been amongst the first mobile network operators in the world to offer a mobile television service. But within a year of the service's launch, the stress that it placed on SK Telecom's 3G network had grown so great that the carrier was required to build a special multicasting network just to handle its mobile television traffic. With many analysts and journalists predicting a similar fate for US operators, mobile telecommunications set out in search of alternatives to unicast mobile television.

The bandwidth crunch forecasted by telecommunications analysts never materialized. In fact, in the United States demand for mobile multimedia services lagged far behind analysts' projections, and many services launched between 2003 and 2007 struggled to attract viewers.⁷ Still, the prospect that mobile television would sometime in the future overwhelm operators' 3G networks continued to influence long-term planning in the mobile telecommunications sector. US mobile network operators explored a number of potential multicasting solutions in this period before the nation's two largest networks, Verizon Wireless and AT&T Mobility, settled on Qualcomm's MediaFLO. They also began acquiring additional spectrum as it became available. Between 2003 and 2008, Qualcomm spent \$683 million to acquire UHF spectrum for MediaFLO and other unspecified future mobile services. In 2007, AT&T purchased a nearby band of frequencies for \$2.5 billion, prompting rumors that it would launch its own competing mobile multicasting service in the UHF band. The following year, AT&T spent an additional \$6.64 billion, and Verizon \$9.63 billion, to purchase additional UHF channels that had been cleared by the DTV conversion. Even these acquisitions, however, did not satisfy mobile network operators' hunger for spectrum. Citing forecasts that demand for mobile television and other data-intensive multimedia services would in fact eventually spike, the mobile communications industry lobby, the CTIA, warned policymakers and the general public that the United States was on the cusp of a spectrum "crisis" that would cripple mobile networks and derail the nation's economy. To avert this crisis, the CTIA petitioned the FCC to free up at least 800 MHz of spectrum for use by mobile companies, preferably from the frequencies allocated to television broadcasting.

In making the case for the transfer of additional spectrum from broadcasters to mobile network operators, the CTIA repeatedly returned to arguments about the cultural and economic obsolescence of the local stations that were this spectrum's incumbent occupants. Together with allies that included the consumer electronics

industry lobby, the CTIA sponsored a massive public relations campaign in the second half of the 2000s to portray broadcasting as an undesirable use of the nation's radio spectrum. The mobile industry lobby aligned itself with proponents of radical spectrum reform in making the case that broadcasting was a medium without a future, and moreover that it constituted a roadblock on the nation's path to technological and economic progress. By continuing to grant broadcasters free licenses to use that spectrum as they pleased, the United States placed itself at risk of falling behind other countries in terms of its development and adoption of innovative wireless technologies. The CTIA claimed, on behalf of mobile network operators, the local broadcasting stations' traditional mantle as trustees of the public interest, linking the expansion of wireless networks to larger national priorities. According to the CTIA's lobbying campaigns, the reallocation of spectrum from television to wireless telecommunications would help balance the federal budget, reestablish the United States' global leadership in the telecommunications and high-tech sectors, and extend access to broadband Internet to underserved populations and regions.⁸

The tone of the CTIA's campaign for spectrum reform cut a sharp contrast to the advertising campaigns that the organization's members conducted during this period. For at the very same time that the mobile industry lobby portrayed broadcasting as irrelevant and broadcasters as expendable, mobile network operators promoted multicasting as a faithful facsimile of broadcasting. Then again, despite their incongruous tones, mobile network operators' determined efforts to establish multicasting's identity with broadcasting were otherwise consonant with the mobile industry lobby's claims on broadcast television's status and spectrum. Mobile television's promotional materials endorsed broadcasting's protocols, but only within the context of touting the mobile industry's ability to remediate them. In effect, they invited US consumers to imagine a future in which something akin to broadcasting would survive, but broadcasters most certainly would not.

"Real TV, Now on Your Phone"

Exemplary of mobile network operators' efforts to affiliate multicasting with broadcasting is a succinct slogan that appeared in some of the advertisements for Verizon Wireless's V Cast Mobile TV: "Real TV, now on your phone." The press release that announced V Cast Mobile TV's 2007 launch eliminated any confusion about what Verizon meant by "real TV" at its outset:

Were you glued to your couch to watch a great play of the big game, catch updates on the 2006 midterm elections, or witness one of those spectacular music award-show eyebrow-raisers? Or worse: how often have you missed those touchstone moments that affect a whole nation because you were on the move? (Verizon Wireless, 2007)

The “real TV” conjured up by this string of questions was television that was watched – and *shared* – with others. It was both the source and the subject of communal experiences and feelings of togetherness that cemented the bonds of the nuclear and the national family. Above all, “real TV” was *live* television, enjoyed in the moment of its transmission, as opposed to time shifted, downloaded, or watched on DVD. In this respect, it was strikingly dissimilar from the on-demand model of television that drew a large number of converts in this period, especially amongst mobile television’s target market of tech-savvy early adopters. At a moment when companies such as TiVo, Apple, and Google were dominating conversations about the future of television with their promises that their products would liberate viewers from the “tyranny” of broadcasting’s unforgiving timetables (Boddy, 2004; Carlson, 2006), Verizon presented V Cast as a throwback to television’s high network era.⁹

It is significant that each of the examples alluded to by the questions that began Verizon’s press release were of live “media events” (Dayan & Katz, 1992), broadcasts that have historically been central to both the ideology and the political economy of free-to-air broadcasting. On numerous occasions throughout the twentieth century US broadcasters defused challenges to the hegemony of the free-to-air network model by recapitulating the argument that broadcast networks’ ability to simultaneously address the entirety of the United States’ geographically dispersed population was critical to the maintenance of national cohesion (Boddy, 2004, pp. 101–102). Though decades have passed since broadcasters were the only institutions that possessed this capability, the importance of media events to the broadcast industry has grown as the national networks’ cumulative share of the television audience has declined. Broadcast coverage of major sporting events, national elections, and annual award shows continues to attract large audiences, generating significant advertising revenues and publicity for broadcasters. Equally importantly, these moments generate goodwill toward broadcasting itself. Live coverage of media events celebrates in explicit and implicit ways the institutions and the protocols of broadcasting. It invites audiences to remember what broadcasting *was*, and by extension makes the case that broadcasting can continue to play its nation-building and binding role in a digital age.

The publicity materials that introduced mobile multicasting to US consumers in this period in many instances made explicit appeals to consumers’ memories of television’s “touchstone moments,” as well as to television’s former status as the nation’s common medium. They did so in tribute to television’s history, but also in order to position the mobile phone as a worthy, and in fact superior, successor. Qualcomm, for instance, produced a minute-long commercial that doubled as an advertisement for MediaFLO and a tribute to live television. Appropriately enough, the spot aired during what was at the time the most-watched live broadcast in US history: the 2010 Super Bowl. The commercial began with a sequence of black-and-white snapshots of television’s infancy, including an Indian Head test card, a roof-mounted antenna, twisting bobbysoxers, Howdy Doody. It then segued into a rapid-fire montage of some of the most iconic moments in the medium’s history. In between brief clips of civil rights marches, the assassination of Lee Harvey Oswald, Neil Armstrong’s moon walk, the

toppling of the Berlin Wall, and the wreckage of the World Trade Center, a series of on-screen graphics invited the audience to recall their own experiences of these “touchstone moments.” “Where were you then?” the text asked. “Where will you *be*?” The montage climaxed with footage of the celebrations that followed the 2008 election of President Barack Obama. Over a shot of a waving US flag appeared the words “Don’t miss a moment.” The commercial ended on a clever trick shot: the footage on the screen rapidly pulled backward away from the viewer, revealing that it was in fact a video playing on the screen of a mobile device (SPOTBOWL, 2010).

Much like the “living timeline” described at this chapter’s outset, Qualcomm’s Super Bowl commercial retraced television’s path from the black-and-white sets of its broadcast past to the ultra-portable devices of its digital future. The layout of LG’s television museum had both literally and figuratively positioned the mobile handset at the culmination of television’s historical trajectory. Qualcomm’s rendering of television history went even further toward the conflation of convergence with progress, claiming parallels between the medium’s technological evolution and the narrative of social progress the commercial’s iconic footage conveyed. These parallels were underscored by the commercial’s montage, which began with images of black-and-white television sets, and black-and-white television images of African American civil rights protesters being attacked with fire hoses, and concluded with vibrant high-definition images of the celebration of the election of the nation’s first African American president. It was furthermore reinforced by its soundtrack, which featured a remix of The Who’s “My Generation” by the hip-hop star will.i.am. Television and the nation were together undergoing a remix of sorts, as embodied by a youthful president, innovative technologies, and a mobile populace. Put another way, both were remediated by the mobile phone.

Conclusion

The US broadcast industry’s answer to MediaFLO – and to the spectrum reform campaigns that gained momentum in the 2000s – made its belated debut in January 2010 at the annual convention of the global consumer electronics industry. That year the convention featured a special “Mobile DTV TechZone” where a group of exhibitors demonstrated prototypes of mobile devices capable of receiving signals transmitted using broadcasters’ mobile DTV standard, which had been finalized in late 2009. In remarks delivered at mobile DTV’s official launch event, NAB chief executive Gordon Smith identified local programming (which remained absent from MediaFLO systems) as mobile DTV’s most important and appealing application. Smith assured his audience that broadcasters would capitalize on this innovation to establish themselves as the leaders in the delivery of “local, live broadcast signals” to all varieties of mobile devices. “That’s the future,” Smith informed the reception’s attendees, “and it includes broadcasters” (Dickson, 2010).

Throughout 2010 broadcasting groups geared up for a mobile multicasting standards war that would pit mobile DTV against MediaFLO. This war, however, was not to be. In December 2010, Qualcomm announced that it was pulling out of the mobile television business. The following March, Qualcomm sold off the MediaFLO system's spectrum to AT&T for \$1.925 billion (Hibberd, 2010). Less than four years after its launch, the technology LG had once called "the future of television" had returned to the vapor.

With the demise of LG's industry standard multicasting solution, clashes between the mobile communications and broadcast industries migrated from mobile television to other fronts. By 2010, mobile network operators had begun to shift their priorities from developing new multimedia services capable of driving up their subscribers' data usage to coping with the strain mobile email and web browsing were placing on their networks. Broadcasters, meanwhile, gained new ammunition with which to defend themselves against accusations of irrelevance, as the popular press became increasingly enamored with the practice (or, more accurately, the premise) of "cord-cutting," or replacing costly cable or satellite television subscriptions with a combination of over-the-air DTV and on-demand Internet video-streaming video services. Though studies suggested that it would be years before cord-cutting had a significant impact on the US television marketplace (Kafka, 2011), the positive media coverage the practice received provided free-to-air broadcasters with a badly needed public relations boost. The NAB capitalized on this growing interest in DTV in public relations and lobbying campaigns that touted the affordability, reliability, and local orientation of broadcast television (Lieberman, 2011).

Clearly, the mobile communications broadcasting industries no longer require competing mobile television vaporware standards to have a reason for a row. In all likelihood, they never did. With the benefit of only a few years of hindsight it is beginning to become apparent that mobile television was for broadcasters and mobile companies a proxy battle in the much larger war over spectrum and policy concessions. To recognize that the real source of conflict between these adversaries laid elsewhere is not to suggest that mobile television was inconsequential to either industry. It is instead a way of emphasizing that recent confrontations over mobile television have taken place within the context of a much longer history of transactions between media and telecommunications companies.

Media studies provides a rich vocabulary for describing these transactions. It is thus possible to speak of the "convergence" of the telecommunications and broadcast industries' infrastructures and business models (Jenkins, 2006); of a legacy of "jurisdictional conflicts" between the two industries that stretches back at least as far as the confrontations between RCA and AT&T over control of commercial radio broadcasting in the 1920s (Altman, 2005); or of the ways in which mobile companies and broadcasters "remediate" aspects of each other's institutional cultures (Bolter & Grusin, 2000). The theoretical models associated with these terms all display strong temporal biases, and address in their own ways the relationships between the old and the new, the residual and the emergent, and the anachronistic and the cutting edge.

But as the case of mobile television demonstrates, the relationships between media and media industries may also be understood as matters of proximity and distance. Convergence, conflict, and remediation occur when the protocols that dictate the arrangements of literal and metaphoric spaces are altered in ways that breach recognized boundaries and bring formerly separate institutions into contact with one another. It is within the confines of these close quarters that the futures of our media are determined.

NOTES

- 1 In a web video produced to promote the event, LG made this argument even more explicitly, declaring the mobile television “the future of TV” (Fathom4, 2007).
- 2 AT&T Mobility is the post-2007 name of the entity formed through the merger of the Cingular Wireless and AT&T Wireless networks. In this chapter I refer to this company as AT&T Mobility, except in those instances where I refer specifically to one of the two pre-merger companies.
- 3 The source of this quote is media industry analyst Christopher Kent, quoted in Waldman (2008).
- 4 Amongst the proponents of radical spectrum reforms were George Keyworth of the Progress and Freedom Foundation, legal scholar and FCC advisor Stuart Benjamin, and Michael Calabrese of the New America Foundation.
- 5 At the conclusion of these investigations, the FCC recommended transferring 500 MHz of spectrum immediately, and an additional 300 MHz in the future, from broadcasting to mobile communications (FCC, 2010, pp. 75–79). To clear broadcasters from this spectrum, the FCC proposed a number of measures, ranging from “repacking” television into a different portion of the radio spectrum, reducing the amount of spectrum assigned to each broadcaster, and giving local broadcast stations the option of forfeiting their channels in exchange for a portion of the proceeds they generated at auction.
- 6 In addition to RealNetworks, other aggregators that began operating mobile television services in this period included the startups Go TV and MobiTV.
- 7 In 2007, the year of MediaFLO’s launch, the clip-based unicasters Mobile ESPN and Amp’d Mobile both suspended their operations due to inadequate subscriber numbers.
- 8 See CTIA’s Position Papers at its “Advocacy” webpage: http://www.ctia.org/advocacy/position_papers/
- 9 Though Verizon’s conception of “real TV” as a source of communal experiences resonated deeply with the structuring ideologies of the US model of broadcasting, Orgad (2009, p. 202) identifies a similar trope within international mobile television advertisements.

Preemption, Premediation, Prediction

The Politics of Betting on the Future

Greg Elmer and Andy Opel

ABSTRACT

In this chapter, Greg Elmer and Andy Opel discuss the preoccupation with the future, and the aim to forecast and control it in advance, through an analysis of the predictive, preemptive logic of “futures markets.” While futures markets are typically associated with speculation about future economic value, their predictive logic has also been applied in attempts to determine particular kinds of social and political outcomes, most famously in the attempt to create “terrorism futures markets” in the United States. The authors examine the forms of subjectivation that animate futures markets – the means by which certain individuals are accredited to participate in and thereby legitimize futures market metrics. In light of the global financial meltdown of 2008, they consider whether futures markets and their accompanying forms of subjectivation are systematically undermining democratic institutions, systems, and processes worldwide. Elmer and Opel’s chapter offers an innovative and compelling approach to understanding media temporality, the financial logic permeating politics, and the reorientation of subjective action around futures and speculation.

Bets are essentially predictions.

(Abramowicz, 2007b)

If this is such a good idea, why haven't the markets created it on their own?

(Stiglitz, 2003)

Media are awash with stories about the future, temporal loops, and time-bending figures that struggle with fate. *Terminators* help humans merely *survive* the inevitable “judgment day,” while *Heroes* perform unimaginable loops through time in vain attempts to stop similar apocalyptic futures. ABC’s 2009–2010 hit, *FlashForward*, offers perhaps the most compelling rendition of the always already experienced future. On *FlashForward*, future visions are experienced by the whole globe, essentially becoming synonymous with human experience. This time traveling, however, is not open ended; it is a near future, a brief experience of living almost a year in the future – just close enough to be familiar, yet distinct. It does not stretch the imagination or call for a suspension of disbelief; rather, the flash forward, the experiencing of the future, provides a seemingly universal experience and dilemma for all those on the planet, save those who are “already” dead in the near future. To not know the future, in other words, is to have already died.

What *FlashForward* suggests is a universally shared subjectivity, through individuated visions that disrupt a previously unknown future. Life stories unfold in a seemingly predetermined fashion whereupon a series of uncanny moments or clues become pieces of a puzzle that, once fully assembled, render a predetermined image, the future-as-present. This same uncanny feeling of inevitability experienced prior to the second war in Iraq led Richard Grusin (2010) to argue that media have increasingly sought to *premeditate* dangerous and risky future events, in an effort to prepare their audiences for preemptive actions. He writes:

Premediation is not about getting the future right, but about proliferating multiple remediations of the future both to maintain a low level of fear in the present and to prevent a recurrence of the kind of tremendous media shock that the United States and much of the networked world experienced on 9/11. (p. 4)

Premediation posits something of a paradox. While preferred futures need to be *premediated*, or otherwise brought into the present, their central messages, images, and tropes also invoke remediations or re-presentations, deriving from past events and mythology. (The attack on Pearl Harbor was one such re-presentation, Bush’s invocation of a “crusade” was another.) To suggest that premediation or other forms of preemptive narration similarly function as media representations, however, would negate the nonrepresentational dynamics of preemptive media politics, the instrumental components of a futurist agenda that seek to bypass dialogue and debate over future paths and solutions. As but one starting point for this chapter, we might question the logic of pre-presentations – or, as was the case in the TV series *FlashForward*, pre-presence. If we use popular culture as one important site of premediation, or

pre-presentation, we find that today the future is as much *lived* as it is viewed or imagined. It is literally a pre-presence, a living in the future-present. As we have noted before (Elmer & Opel, 2008), the notion of already being in the future is a common one, and one that suggests, rhetorically, that there are few options or alternatives. As a consequence, debate, dialogue, and dissent – key components of liberal democracies – must give way to preemptive action. Pre-presence eschews talk of likelihood and probability, in the vernacular “what-if” scenarios, in favor of “when-then” declarations of action.

While such future-focused programs speak to contemporary anxieties over future social, economic, and geopolitical risks, it is also the case that similar efforts to preassemble the future into the present have been going on for decades. Specifically, such efforts have taken the form of financialized future-risks, commodities, markets, derivatives, and other financial investments that seek to price and monetize the future. It is only relatively recently, however, that “futures markets” – trading systems that seek to establish and otherwise account for future economic value – have also sought to monetize future social and political outcomes. Such markets are more commonly referred to as “prediction or information markets,” “idea futures,” or “event futures” (Wolfers & Zitewitz, 2006). This chapter focuses in particular on financial strategies that have evolved from the University of Iowa’s Iowa Electronic Market (IEM) project,¹ which sought to establish future political outcomes through an economic market that called for “investors” to buy shares in the most likely political outcome. Established in 1988, the IEM market is now used by universities worldwide for pedagogical and research purposes. Moreover, the logic of the IEM has inspired a host of similar markets, including, as we discuss in this chapter, the controversial US Defense Advanced Research Projects Agency’s (DARPA) Policy Analysis Market, also known as “terrorist futures markets.”

Unlike traditional markets that monetize future commodities, services, or contracts through an assessment of economic relationships, environmental, and even political risks, IEM-style futures or prediction markets increasingly invoke and monetize traders or investors to justify their collective future visions. For such prediction markets, monetizing risk is not necessarily the only goal. Instead, such markets also aggressively lay claim to a science of sorts, an ability to more accurately predict future events through the collective bets placed by traders. While such bets on the future are aggregated or crowd-sourced to give a larger sample of investment predictions, the legitimacy of these markets is overwhelmingly articulated as a singular act: the accrediting of individual participation in the markets.

This speculative future, then, is not simply an exercise in providing market-friendly visions of the future; rather, it is an attempt at expanding the financialization of everyday life (Martin, 2002) outward (across economic, social, and political sectors) and forward (in time), to the very contours of the possible – the unknown future. Critics of market financialization have provided compelling critiques of the recent global financial meltdown, focusing in particular on the demise of infrastructure investments, and the concomitant rise of derivative pricing (Ayache, 2010; LiPuma

& Lee, 2004) and speculative forms of commodity financing (Marazzi, 2010). This chapter builds on these critiques to interrogate the subjects of contemporary futures markets: those individuals who are accredited to participate in markets that seek to price – and give probable weight to – political, cultural, and foreign policy futures, including elections and military coups. In other words, we examine the forms of subjectivation that animate futures markets – the means by which individuals are accredited to participate within and thus legitimize such futures market metrics. And we question whether such futures markets and their accompanying forms of subjectivation may be undermining democratic institutions, systems, and processes worldwide.

Accreditation in the Future-Information Economy: Discrediting the Political

Before we move toward a more in-depth discussion of the mechanics of futures markets and prediction markets, some further conceptual remarks concerning the subjectivation of both the market and the political sphere in general are in order. Of particular concern here is the concept of accreditation, the means by which futures markets cultivate and legitimate their future-predictions with trading platforms that act as much to premeditate insider-traded or individuated risk-averse bets as they do to monetize future risk. In such a state of affairs, we again highlight the need to understand the manner in which markets themselves (and their boosters, of course) tell stories about who may – individually and socially – participate in the act of predicting the future.

In *Catégories de l'impolitique* (2005), Roberto Esposito offers a critique of influential conservative philosopher Carl Schmidt's (2007) definition of the political – one defined simply as the relationship between friend and enemy. Esposito argues, conversely, that such a relational form or definition of politics is increasingly displaced, though he reminds us that this is not to be confused with emergent apolitical or nonpartisan domains. For Esposito, politics is as much defined by negation, invisibility, or absence as it is by Schmidt's blunt and pervasive assessment of social relations and antagonisms. That which is beyond question, or autonomous, as Esposito defines it – particularly with regard to the function of the market or economy – exemplifies the "impolitic," a set of relations that are considered inevitable, as existing outside of meaning, and thus ultimately unrepresentable (2005, p. 11). Futures markets similarly feed upon an impolitics of forecasting, a truth-telling mode of intelligence gathering, with an invisible hand that is embedded not in the market as such but in the affective truth – the gut feeling – produced by investors-at-monetary-risk. To suggest that such future visions are unrepresentable, however, would miss the point. Again, the future is intensely remediated through past histories and future-images and visions, defining who we are, where we have come from, and what it *will* be like

in the future. At the same time, future mediations also invoke decidedly instrumental and impolitical techniques and logics. That is to say, predictive markets not only offer visions, they also serve to define or altogether negate a socially inclusive process of decision-making, choice, and options – in short, democratic life.

Matthew Fuller and Andrew Goffrey's "Evil Media Studies" (2009) similarly suggests that media studies must move beyond critiques of representation and spectacle to an understanding of the "sorcery" of media, the "hypnotic" effects that cannot be reduced to semantic forms of critique and analysis. Following Lazzarato (2004), Guattari (1995), and others, Fuller and Goffrey suggest that media increasingly define the world around us, the very landscape upon which mediation is enabled (2009, p. 143). To suggest that such a media world is "evil" emphasizes that the structure, function, and essence of the possibilities for communication are *a priori* corrupted. However, Fuller and Goffrey's invocation of an *evil* media studies paradigm stops short of our focus on time, on a future media studies that posits an already visited or experienced future. Still, Fuller and Goffrey's *evil* media studies does posit a vision of media as embodying, or spawning from, an always already decided future, a tomorrow that cannot arrive unexpectedly since it carries with it evil intent too risky for society to ignore.

Like Esposito and Fuller and Goffrey, Bernard Stiegler (2004) concludes that the encoding of the very possibility of media, and of communication in general, follows a preemptive logic, a mode of subsistence (as opposed to existence) that proffers nothing but survival – a symbolic misery ("*misère symbolique*") (p. 30).² In *Mécréance et discrédit: la décadence des démocraties industrielles*, Stiegler's concern with future media is wrapped within contemporary networked information and communication technologies, a concern that he expresses in terms of a radical shift toward a mathematical terrain of communication. Stiegler argues that, ironically, such a statistical terrain is dominated as much if not more by collective sentiment and emotion than it is by rational or scientific probability. Such collective sentiments lie at the heart of futures or prediction markets – such markets only work, as we shall see, if individuals are motivated by fear of possible financial loss (of a bet or "investment"). Stiegler refers to such a landscape as existing "*désormais*," which importantly has two complementary definitions in French, referring both to "in the future" and to that which exists "now, going forward."

Stiegler's political critique of contemporary postindustrial life is also wedded to broader debates about the relationship between culture and economy, a shift clearly evident in the move from futures (commodities) markets to political prediction markets. For Stiegler, the economic and cultural spheres are one and the same, or at least significantly define each other. Culture, defined as collective sentiment and emotion, has come to define the domain of the economic, particularly as manifested in information and communication technologies (ICTs), networks, and digital life that "feed back" circuits of production, exchange, and consumption. Within such an "*épokhè*," as Stiegler refers to it, information capitalism suffers from a systemic mode of discredit ("*discrédit*") (p. 29). We believe that here Stiegler suggests a process

of not only disabling, misrepresenting, or marginalizing voices and opinions, but altogether removing *accreditation* – the very means and mechanisms through which one can participate in political and economic life.

Such debates over voice, authority, and accreditation are hardly new. Rather, in many respects our discussion of the preempting of democratic life dates back centuries, invoking classic definitions and debates over the possibilities and limits of democratic politics. Yet, in the modern or electronically mediated era, we argue, debates over political roles and responsibilities have intensified, particularly with regard to political justifications, mandates, and other claims of legitimacy. Claims of popular support, of course, seemingly trump all other considerations in the conduct of public life, including legal frameworks (Agamben, 2004), and even the learned opinions of individual experts, as Walter Lippmann (1997) famously defined them: “[The expert] [. . .] is certain, moreover, to exercise more power in the future than ever he did before, because increasingly the relevant facts will elude the voter and the administrator” (p. 241).

Lippmann’s views are of particular concern today as his thesis of political leadership – the need for a special leadership class of learned individuals – mirrors in many respects contemporary fears over meta-information. These fears invoke the simple fact that information, and of course opinions, are ubiquitous – making it nearly impossible to discern the truth or plan for the future. In such a state of affairs, some have claimed that new mediated spaces, such as the web and social media, have led to a degradation of authority (Keren, 2006). And at a time when political mandates have seemingly become harder to achieve, both within and outside of political legislatures, popular opinion and other forms of voter “intelligence” have become increasingly more important to politicians, corporate leaders, and other policymakers. Political opinion today, however, is not simply invoked or manipulated by the political elite to support their own predetermined plans, as some have argued (Lewis, 2001). Rather, as we detail in the remainder of the chapter, it has increasingly divested itself of any claims to mass representation, “informed” or otherwise. Markets now speak in the present about the future.

It is here that we begin to speak more of the growing influence of so-called *futures markets* – systems and platforms, not merely polls of consumer or voter opinions, that have increasingly caught the attention of policymakers, economists, data miners, and other members of the intelligence-gathering class. Such futures markets encapsulate the emerging power of accredited forms of prediction technologies and techniques that displace debate, dialogue, and discussion in favor of accredited opinions (bets) and insider trading, a process fueled by the fear of monetary loss (the market “investment”). Some have argued that betting on political outcomes can be traced as far back as sixteenth-century Italy, eighteenth-century Britain, and the nineteenth-century United States (Rhode & Strumpf, 2008). As we argue in this chapter, futures markets also have their genesis in both media and markets, for example with the emergence of the telegraph. While the telegraph facilitated the telling of stories (interpersonally, or socially through newspapers and other media), it also *produced* a

new economic landscape (as Fuller & Goffrey, 2009 likewise noted) that enabled shifting representations of everyday life. James Carey argues how the introduction of the telegraph in the United States, for instance, fundamentally changed modern perceptions of time, space, and markets. The telegraph, in other words, produced a real-time form of communication that in turn facilitated the expansion of markets both spatially (national markets) and temporally (futures commodity markets). Real-time, national communication thus fueled a speculative move in market dynamics, where changes in weather that affected crops in Florida, for instance, could be communicated across the country in real time, in effect producing a futures market price in advance of the final production cycle. Carey (1989) writes:

the significance of the telegraph does not lie solely in the decline of arbitrage; rather, the telegraph shifts speculation into another dimension. It shifts speculation from space to time, from arbitrage to futures. After the telegraph, commodity trading moved from trading between places to trading between times. The arbitrager trades Cincinnati for St. Louis; the futures trader sells August against October, this year against next. To put the matter somewhat differently, as the telegraph closed down spatial uncertainty in prices it opened up, because of improvements in communication, the uncertainty of time. It was not then mere historic accident that the Chicago Commodity Exchange, to this day the principal American futures market, opened in 1848, the same year the telegraph reached that city. In a certain sense the telegraph invented the future as a new zone of uncertainty and a new region of practical action. (p. 218)

Today, intelligence, data mining, consumer and voter behavior researchers are similarly fixated on the future, moving forward and, of course, “in” the future (as Stiegler again reminds us). These futures markets differ from public opinion polling, where individuals are asked to state or express their opinions on a series of issues, and even from telegraph-enabled futures markets, where weather patterns and their potential impact on agricultural productivity were communicated in near-real time. A key difference is that contemporary information or intelligence-based futures markets seek to accredit the feelings of individuals and “insiders” who have first-hand knowledge of variables that could possibly alter future markets, opinions, or world events. Some key futures market boosters, particularly Michael Abramowicz (2007a), also note, as Lippmann did many decades ago, that “information overload” is motivating developments and adoptions of futures markets. But such proponents almost always invoke the affective aspects of financial “investment” – what we (via Stiegler) refer to as *accreditation* – as the key component required to enable the predictive capacities of futures markets. Futures markets, in other words, serve much more than mere aggregators, ranking algorithms or other sorting machines. In short, they call for “bets,” not opinions, affinities, hopes, or even desires. “A prediction market, then, is a decision-making device for excluding from consideration predictions that no one appears willing to back with money” (Abramowicz, 2007a, p. xii).

Politically speaking, our concerns with such betting markets lie in the fact they are used to invoke the future-as-now, a not-so-subtle setting of the political and

economic agenda. Futures markets reconfigure social relations around a depoliticized model of hyper-individuation. Wage earners become wager-ers, with all the associated risks and benefits condensed down to an individual level. Where citizens participate in governing decisions, debating policy solutions to collective problems such as education, criminal justice, or traffic congestion, wager-ers seek to maximize their own profits, risking personal financial loss. Such markets thus invoke fear of economic loss (at best) to define the future as predictable. Furthermore, for some prediction markets like Intrade, both the market and the future are greatly simplified and predefined before investments are even made. In addition to such futures being overdetermined by singular events, prediction markets call into question the framing of the future in terms of “either/or” propositions. In the case of Intrade, trading in futures markets is reduced to a “yes” or “no” proposition, as its website indicates:

Intrade is a platform where you make predictions by buying and selling shares on the outcome of real-world events. These events are always defined on Intrade as a YES/NO proposition. For example, here are a few of the markets currently available:

- The Dow Jones to close on or above 13,000 on 30 Dec 2011
- Barack Obama to be re-elected President in 2012
- Osama bin Laden to be captured before midnight ET 31 Dec 2011

There are two possible outcomes to each of these events – yes, the event will happen as described, or no, it will not happen. The Dow Jones will either close on or above 13,000 or it won't. Barack Obama will either be re-elected President in 2012 or he won't. You get the idea.

This allows you take [*sic*] a clear position on each event – you can either predict the event will happen, or it won't happen. You then back up your prediction by buying or selling shares in the market. (Intrade, n.d.)

Such futures/prediction markets do not ask respondents to divulge their preferences, likes, or even dislikes; rather, they ask individuals to wager (or risk their assets) on specific future events, not what they would like the future to be or even what set of factors contribute to future outcomes. Futures market defenders, like futures market booster Michael Abramowicz, argue that such criticisms miss the point. For them, such markets cannot work with “opinions” since they are tainted by “sentimentality” (2007a, p. 6), in lieu of apparently objective gut feelings produced by the risk of financial loss. But such markets often actively promote themselves to so-called insiders, those who in fact have nothing to lose at all – quite the opposite: since insider knowledge is actively courted, their agendas are much more likely to be “predicted.” Or according to Abramowicz: “Because no one is forced to participate in a prediction market, those who participate tend to be those who have information relevant to the particular prediction or at least those who can obtain the information at low cost” (2007a, p. 7).

Abramowicz articulates the central assumption about futures markets: they will more effectively solicit “insider” knowledge – information that could not be found

by other means of collection, surveillance, or solicitation. Thus, in addition to accrediting future visions invoked by those market participants who risk financial loss (market bets), futures markets also seek out those individuals, groups, or communities that are already in positions to dictate future events. The move away from polling and intelligence-gathering techniques that seek to collectively determine potential future events and outcomes, therefore, is better understood as an enticement program. These techniques are efforts to accredit those in a position to directly financially suffer while also actively proffering financial gain to those already in positions of knowledge and control. One need look no further than the US Pentagon's 2003 "terrorist futures market" to view how the logic of such futures markets expanded to accredit wagering cynics, driven by fear and insider-opportunists whose positions in society and the economy could in fact direct future outcomes.

Betting on Terror

On July 28, 2003, the Pentagon announced the formation of the DARPA-backed Policy Analysis Market (PAM),³ or "terrorist futures market" as it came to be known. The program was designed for cultures, regions, and nations where the United States had little to no intelligence-gathering mechanisms, limited surveillance techniques, or reliable political allies. To an extent, the PAM betting system was designed to act as a new form of intelligence gathering, one that would replace overt surveillance techniques that had failed to produce actionable or reliable information in the past. While the US military had been called upon to smoke out terrorists and insurgents, PAM's market logic proposed the establishment of an embedded mechanism, an insider trading market. To use police terminology, the program attempted to create its own legion of market-enticed "informants."

In short, the PAM program proposed an online, real-time form of betting on the likelihood of the next terrorist attack (among a host of other security-related issues). As the US Defense Department noted, "research indicates that markets are extremely efficient, effective and timely aggregators of dispersed and even hidden information" (quoted in Hulse, 2003, p. A1). The PAM was based on the efficient market hypothesis, the central premise being that collective thought, and in particular insider knowledge, is more accurate than individual opinion or policy analysis from a distance. Under the PAM proposal, the Pentagon was to act as "the House," setting the odds on "literally millions of possible scenarios" (Coy, 2003). In a contradictory and somewhat confusing attempt to harness the power of market incentive while limiting the potential to profit from terror and manipulate the markets, bets were to be limited to \$100. This price cap was also said to be a way to minimize the cost to the government as it expected to lose money to well-informed investors. This cost was seen as a small price to pay for accurate information (Coy, 2003).

The program gained considerable notoriety through the media when former US Senator Hillary Rodham Clinton referred to the program as a “futures market in death” (Pethokoukis, 2004). The controversy prompted an intense debate in Washington and on cable news, where the program was attacked as “morally repugnant and grotesque,” and criticized as a potential venue for terrorists to bet for or against their own efforts and potentially profit from their actions (Hulse, 2003). A week later the Pentagon scrapped the idea. Shortly after the program was shut down, though, a chorus of economists began to articulate the rationale behind the PAM, chiding critics for injecting morality into a prediction modeling tool that was designed to prevent future attacks. Former CNN financial commentator and anchor Lou Dobbs, for one, accused the critics of PAM of “asserting the all-too-familiar orthodoxy of both Washington and New York, the capitals of politically correct-inspired conformity” (Dobbs, 2003). As details of the program emerged after its demise, the coupling of insider “prediction” and market forces became clear. George Mason University economics professor Robin Hanson, the scholar behind the model, defended the program as a way to “pay people for information about bad things” (Said, 2003).

While the semi-public version of PAM was scrapped, a privatized version has since reappeared from Net Exchange, an original partner on the DARPA-led project. The program was defended as a viable alternative to surveys and a new tool for gaining potentially valuable information. The most ethically contentious, subjective component of such a market, however, continued PAM’s accreditation of “insiders.” In a 2003 presentation to the Microsoft research department, a representative of Net Exchange (2003) discussed possible “investors” in the market: “Mossad agent thinks Hamas mil. [sic] wing will not disband – buys ~B @\$0.50.” Net Exchange president Charles Polk explained it this way: “One way to look at the use of a market-type process is that it provides a filter at the very front [and provides] the incentive to concentrate on those things that they actually know something about” (quoted in Edmonson, 2003).

Conclusion

At a time when casinos and other forms of state-sanctioned betting continue to be approved by jurisdictions worldwide, betting on political outcomes has not only become a commonplace pastime and game, it has increasingly sought to replace polling as the most accurate predictor of future electoral results. Such dubious claims of accuracy and predictability point to perhaps the most insidious anti-democratic components of prediction and markets. Putting aside the “insider wager-er” that is often less prominent in more policy-based forms of futures markets, the collective forms of intelligence that such systems invoke raise troubling questions about how political forecasting techniques can be used to preempt democratic elections.

At the turn of the nineteenth century, crowds were feared – consistently represented as dangerous masses or mobs that threatened capital from the outside. Some insist that contemporary mobs can now be “smart,” assisted by social forms of mobile communication (Rheingold, 2003). However, futures markets rely upon a much more sinister, cynical, and fearful crowd. The crowds that collectively predict the future today channel fear and loss, within a market-based mentality, as a means to posit the future-as-present. Today’s mobs, in other words, are not *represented* as fearful but instead are harnessed or harvested for their collective fear. Futures markets are constituted by fear.

To suggest that futures markets harness fear is to recognize their nonrepresentational characteristics. The goal of futures markets is to move beyond signification, representation, dialogue, and debate and into the future, or rather, into a future-act in the present, a future-oriented solution in the present to a problem that has allegedly already happened in the future. Such time-traveling-like endeavors are intensely mediated, or premediated as Grusin suggests. Yet we also argue that such futures markets actively discredit political forms of representation. In fact, they aggressively strive to undermine polling and other ways of representing political opinions as being unreliable and “sentimental.” To participate in such a forward-looking enterprise, then, one must become accredited, which is to say, risk one’s credit and, more importantly, answer the simple question: what do you *believe* will be the outcome, not what do you hope the outcome will be.

Futures market boosters thus emphasize the integrity of future visions that derive from fear and loss – from individuals betting “their own money.” In true market fashion, all value is reduced to personalized financial value, which is said to be the best indicator of collective will because people only risk their own money when they have a strong degree of confidence. This fundamental assumption about prediction markets and preemptive thinking in general denies the broader conditions of consumerism and commodity fetishism, where people will make repeated irrational, impulsive, emotion-based purchases with little regard for potential financial implications. This irrationality is essential to modern consumer society and its associated markets, allowing wealth bubbles to emerge and capital to be concentrated “before the bubble breaks.” The celebration of individual financial risk as a measure of accreditation suggests that losing money is the worst thing that can happen to an individual. Such a financialization of politics and society neglects the impacts of lost infrastructure, especially the losses to collective goods and services, such as clean water, public roads, a rules-based judiciary, and adequate schools that ensure basic literacy across the population (in the enduring struggle to prevent the emergence of a large underclass). When political changes are reduced to individual risks and rewards, personal balance sheets may reflect changes, but the social costs of policy changes are never tallied.

The irony of celebrating the visionary “wisdom” of futures markets, even as market failures have rippled across the globe, appears to be lost on futures markets’ boosters. As colossal as they have been, market failures have not inhibited the

proliferation of “betting as voting” venues or the valorization of those venues in the mass media. With policy debates that seem too complicated and muddled by competing facts hurled by opposing experts, individual agency is directed toward the betting table, where the “wisdom” of the masses or mobs overcomes the elitist predictions of the pundit class or the wishes of public opinion.

Reconstructing Accountability

Essential Journalistic Reorientations

Martin Eide

ABSTRACT

An essential challenge for media studies, in a time when newspapers are in crisis and the practice of journalism is more contested than ever before, is to understand the problem of journalistic agency. In this chapter, Martin Eide provides a foundation for examining journalistic agency by charting major shifts in the political economy and professional framework of journalism. Eide argues for renewed attention to accountability journalism – a form of journalism that holds the powerful accountable and is itself accountable to an informed citizenry. For this endeavor, he suggests that we can gain useful insights from scholarly work on the problematic of structuring. It might then be possible to understand the limits of journalistic agency and develop workable versions of accountability journalism. Some have argued that journalism, in a time when “we’re all journalists,” should simply be regarded as an activity, rather than as an institution. Eide disagrees, stressing the need to conceive of journalism as a vital social institution that needs to be reoriented toward a more viable future.

While the institution of journalism is in the midst of profound reorientations, lots of people are concerned about the future of quality journalism and democracy. Many believe that high-quality news matters. A prominent spokesman of this view, President Barack Obama, puts it like this:

The International Encyclopedia of Media Studies, First Edition.

General Editor Angharad N. Valdivia.

Volume VI: *Media Studies Futures*. Edited by Kelly Gates.

I am concerned that if the direction of the news is all blogosphere, all opinions, with no serious fact-checking, no serious attempts to put stories in context, that what you will end up getting is people shouting at each other across the void but not a lot of mutual understanding. (Quoted in McChesney & Nichols, 2010, p. ix)

The journalism at stake is one that provides facts and constitutes the basis for an informed public. It is a journalism that feeds democracy, performs a crucial watchdog role, and holds the powerful accountable. The printed newspaper has traditionally been the key arena for this kind of accountability journalism. But during the last decades, new technology and new forms of communication have provided new platforms and new opportunities for serious journalism and democratic discourse. Simultaneously, the economic foundation for this kind of journalism in traditional as well as new media is facing severe challenges. This ambiguity generates certain professional tensions, and most prominent in this regard is the tension between the democratic functions of journalism and economic constraints.

The corporatization of the media and the logic of commercial journalism paved the way for the crisis of journalism long before the arrival of the Internet. Recently, this crisis has been intensified through a persistent decline in newspaper readership and advertising revenues – surrounded by an unprecedented media convergence with the Internet as a driving force. Together these developments have upset mainstream media practices to a new level of ambiguity. Journalism's ontology is challenged. Journalistic reorientations – including a revival of the ideals of the Fourth Estate – have become critically necessary. One thing is that journalism must hold those in power accountable. It is as imperative that journalism itself must be held accountable by an informed citizenry. In an age of essential journalistic reorientations, accountability and the social contract of journalism need to be reconstructed and sustained.

To succeed in this endeavor does not necessarily mean rescuing the institution of the printed newspaper, although the newspaper has been regarded as the main carrier of the values of accountability journalism. "Goodbye to the Age of Newspapers (Hello to a New Era of Corruption)" is Paul Starr's catchy title for an essay on the newspaper crisis published in the *New Republic* (March 4, 2009). He points to the danger reduced news coverage represents for the integrity of government. "It is not just a speculative proposition that corruption is more likely to flourish when those in power have less reason to fear exposure," Starr writes. Newspapers' role as a civic alarm system, functioning as "our eyes on the state, our check on private abuses," is in peril, according to Starr.

To a certain extent it is true that it has mainly been in the print media and in public service-oriented television and radio corporations that we have found the qualities and ideals Starr refers to. The "old media" have, so far and with some conspicuous exceptions, served as agenda setters for "new media." News items that pop up in different websites and blogs have typically evolved in traditional media of journalism. In a required reconstruction of accountability journalism, however, "new media" will have an indispensable and autonomous role to play, although the quality of the actual

journalism will be more crucial than the media platform. The content is more decisive than the carrier.

It is journalism, not the printed newspaper *per se*, that needs to be sustained. It is the professionalism and the values of the *institution of journalism* that are of vital importance, regardless of whether journalism is performed on the web or on paper. Journalism has to prove its indispensability as a public good and as an essential element in democracy's infrastructure. In a new media situation, journalism must continuously reconstruct its accountability.

What is accountability journalism more precisely? We can start with a synthetic list provided by Robert McChesney and John Nichols (2010), defining what they label "healthy journalism":

1. It must provide a rigorous account of people who are in power and people who wish to be in power, in the government, corporate and nonprofit sectors.
2. It must regard the information needs of all citizens as legitimate.
3. It must have a plausible method to separate truth from lies, or at least to prevent liars from being unaccountable and leading nations into catastrophes – particularly wars, economic crises and communal discord.
4. It must produce a wide range of informed opinions on the most important issues of our times – not only the transitory concerns of the moment, but also challenges that loom on the horizon. These issues cannot be determined primarily by what people in power are talking about. Journalism must provide the nation's early warning system, so problems can be anticipated, studied, debated and addressed before they grow to crisis proportions. (pp. 163–164)

This list covers fairly well journalism's crucial role in holding other social agents accountable and keeping the citizenry informed. It needs one important amendment, though: journalism itself must be held accountable in relation to its social obligations and ethical standards. Some kind of an accountability system must be activated to provide a rigorous account of journalism and to maintain a lively debate about journalistic quality.

Already, there is a wide range of so-called "media accountability systems" available. The phrase refers to different kinds of instruments to improve the dialogue between journalism and society. These instruments have been categorized into internal, external, and cooperative systems (Brurås, 2009). Internal versions may consist of systems for corrections and complaints, internal ombudsmen, efforts toward transparency in the editorial process, and annual accounts of journalistic shortcomings and achievements. External accountability systems may include different bodies for media criticism (such as watch blogs) and watchdog institutes. Cooperative systems may include reader panels, external ombudsmen, public hearings, and complaint channels.

In the early 1990s, the French media scholar Claude-Jean Bertrand counted 40 different versions of media accountability systems. Later on, he extended the list to 110 examples (cf. Brurås, 2009). Media accountability systems address the prevailing need

for the legitimization and justification of journalistic practice and the social role of the journalistic institution. They have been considered a “third force” of media regulations, between the law and the market, or as a middle course between the bureaucracy and the jungle, to paraphrase Claude-Jean Bertrand (2003, p. ix).

Journalism studies also faces fundamental challenges in a time when the phenomenon and concept of journalism are contested. An essential challenge is to understand journalistic agency in a time when the profession is in flux. Sustainable research of journalism should also engage in field analyses in order to grasp changing boundaries and oppositions in the journalistic field. But, and most importantly, journalism studies has to address the interplay between structure and action in an intelligent way. A quest for a “third way” might also be relevant in this domain.

Against this backdrop, this chapter elaborates further on the unsettling situation for quality journalism and some of the accompanying and essential reorientations, from a normative and institutional perspective, along three dimensions. First, the political economy of accountability journalism is considered, with an emphasis on proposals concerning public subsidies and state intervention to save accountability journalism. Second, a few points will be made concerning professionalism and journalism’s normative foundation. The key issue here will be the changing relation between journalists and their audiences (or “the people formerly known as the audience,” as the popular saying goes). Third, some future challenges for journalism studies will be emphasized, with a focus on the pressing theoretical need to understand journalistic agency under the new circumstances.

On the Political Economy of Accountability Journalism

The main feature of the traditional business model for producing news was that advertisers paid media organizations that provided them with desirable audiences, while these audiences were “provided with public affairs-oriented material that contributed to their ability to make the informed choices that are the hallmark of democratic political life” (Freedman, 2010, p. 39). The newspapers, literally, have been market intermediaries, connecting sellers and potential buyers, and as a byproduct the advertisers subsidized the production of relevant news for the citizens. “If there is one overriding factor behind the current financial crisis of the press,” Paul Starr (2009) states, “it is simply that the Internet has undermined the newspaper’s role as market intermediary. Advertisers do not need to piggyback on the news to reach consumers, and consumers have other ways to find out about products and sales.”

In this situation, there is no reason to believe that advertisers will return to newspapers, and resources for journalism are now disappearing from old media faster than new media can develop them. Consequently, journalism’s traditional business

model might be beyond a point of no return, and the political economy of journalism is changing in ways that jeopardize the future of quality journalism. There is, furthermore, not much faith in the obvious method for generating income from media content, erecting “pay walls” and charging the user. Niche newspapers, like the *Financial Times* (UK) and the *Wall Street Journal*, are among the few that have successfully charged their readers for web access. When a major player like Rupert Murdoch introduced the “pay wall” scheme in 2010 for some of his British quality papers, *The Times* and the *Sunday Times*, the strategy was met with curious interest in the news business, but very few regarded it as a viable solution. Earlier, the *New York Times* had failed with a similar attempt. Still, there is light at the end of the tunnel, and there are optimists out there – on behalf of sustainable quality journalism.

I will refer to two different optimistic accounts, which both advocate a public contribution in order to solve the crisis, but to different extents. One approach talks about a reconstruction of journalism, the other sticks to a rhetoric of life and death. The first take is provided in the report entitled “The Reconstruction of American Journalism” by Leonard Downie, Jr. and Michael Schudson (2009). The second recommendation is put forward by Robert W. McChesney and John Nichols (2010) in their book *The Death and Life of American Journalism: The Media Revolution That Will Begin the World Again*.

Downie and Schudson state that they share the distrust US citizens tend to have of direct government involvement or political influence in independent news reporting. But, they maintain: “this should not preclude government support for news reporting any more than it has for the arts, the humanities, and sciences, all of which receive some government support” (Downie & Schudson, 2009, p. 72). The recommendation advocated, then, is a varied mixture of ways to support news reporting, which must include nonmarket sources like philanthropy and government.

McChesney and Nichols (2010) issue a bolder diagnosis and propose a somewhat stronger medicine. They contend that it is now necessary to “face the hard and cold truth” and accept that “journalism is a public good that is no longer commercially viable” (p. 4). They state that while it “may have been true that, for much of this country’s history, commercial interests provided sufficient resources for the provision of journalism, this is no longer the case” (p. 154). They argue that it is now of major importance for the state “to institute policies to aggressively create and support journalism” (p. 110). In a reinterpretation of US media history, the authors also reject the myth of “laissez-faire” and “government-hands-off” and the tendency to hide direct and indirect press subsidies. Why institute a more central role for the state to support the journalistic enterprise? In response, McChesney and Nichols deliver a surprising answer: it is the American way.

Neither of the two academic partnerships, however, proposes a solution similar to the Scandinavian countries, with direct state subsidies to the press, although they note that those subsidies have not affected journalists’ willingness to provide criticism of governments. The Scandinavian model – or the democratic corporatist model, to

use the concept proposed by Hallin and Mancini (2004) – is characterized by a high level of journalistic autonomy. Countries in Northern and Central Europe (Scandinavia included) “also tend to combine strong protection of press freedom with a significant level of regulation – again reflecting the assumption that media are a social institution and not simply a private business” (Hallin & Mancini, 2004, p. 163). The democratic corporatist model is characterized historically by a high level of journalistic professionalization and by “a strong tradition of limits on state power,” combined with “strong welfare state policies and other forms of active state intervention” (Hallin & Mancini, 2004, p. 145).

A lesson to be learned from this particular model of media and politics is the possibility of a coexistence of an active state and strong accountability journalism. And it is interesting to witness a new openness regarding future business models and public support of journalism at the other side of the Atlantic.

While McChesney and Nichols write vividly about the current crisis, and even about the death of US journalism, they simultaneously stress the potential for a new and better journalism in “the age of the possible.” It is not a matter of just saving journalism “but to provide America – and the world – with a greater journalism than any of us has ever known” (p. 229). In a similar vein, Leonard Downie and Michael Schudson remind us that the means of news reporting are being reinvented, and the character of news is being reconstructed. In these exciting but challenging times for the institution of journalism, new modes for financing accountability journalism are also being implemented and explored.

Downie and Schudson document a wide variety of such initiatives to provide accountability journalism. Many of them have a local basis, many specialize in investigative reporting, many are based on collaboration between professionals and amateurs, and many have a nonprofit foundation and approach. A majority of efforts like these can be conceived of as a possible reconstruction of accountability journalism. They are responses to an overall structural challenge in the current situation for quality journalism, to preserve “independent, original, credible reporting, whether or not it is popular or profitable, and regardless of the medium in which it appears” (Downie & Schudson, 2009, p. 12). Simultaneously, journalism’s professionalism and its normative foundation are at stake.

On Professionalism and Journalism’s Normative Foundation

The professional framework of journalism is challenged when the relationship between journalism and its audiences is in a phase of transition. The whole idea of professionalism is under siege in the age of the amateur and the citizen journalist. One response is to redefine the role of the journalist and to engage in dialogues and

conversations with “the people formerly known as the audience.” The ways in which this is done should be subjected to investigation and discussion.

The participatory turn in the relation between professionals and amateurs in the field of journalism represents an essential journalistic reorientation. Prevailing slogans for this reorientation are “pro-am journalism” (where pro-am is short for professional–amateur), participatory journalism, and citizen journalism. Alan Rusbridger, editor of the *Guardian* in the UK, speaks about “the mutualization” of the newspaper, a process in which “our readers have become part of what we do.”

They write commentaries for our Comment is Free site – they have helped with investigations into tax avoidance and police brutality. They form communities around individual reporters and issues, lending a hand with research and ideas, bringing us up short when we get things wrong. They have collaborated on big projects needing resources beyond our scope. We have done things that would have been impossible without them. In return we give them a more diverse form of journalism and the visibility that comes from a platform that reaches some 30 million unique users a month – two thirds of them outside the U.K. (Rusbridger, 2009)

Obviously, this is a success story with a considerable potential to inspire further mutualization of journalism and new efforts toward dialogue between journalists and audience members. The flourishing of so-called user-generated content and blogging stimulates a debate about journalistic expertise: what is it, and where is it to be found?

Christopher Anderson (2008) here points to an intriguing paradox at the core of the journalistic professionalization project. While professionalization is about drawing lines of demarcation against other professions and agents, journalists’ professional identity also consists in keeping the professional borders open. For instance, there is a tendency to celebrate journalists who have entered the profession as outsiders. Furthermore, Anderson points to the still deep ambivalence among journalists toward the notion of the “journalism school.” In short, Anderson (2008) writes, journalistic expertise “seems as *generous* as it does *jealous*” (p. 263).

The mutualization of journalism also represents a generous approach toward the empowered audience and the providers of user-generated content. Journalists have to take on a new role, it is frequently argued; they can no longer act as teachers and lecturers but should engage in a dialogue with readers, listeners, and viewers. Journalism should be more of a seminar than a lecture (Gillmor, 2006, p. xxiv). Here the journalist is conceived of as a guide and a catalyst in a user-generated traffic, where the users are equal partners in a joint venture with professional journalists. But this is a false presumption, in my view, since the journalist necessarily has a different assignment and different responsibilities than the audience member or “user” of new media. There will always be a distinction between the professional and the amateur, and this relation will always be one of power and authority. In a seminar, a professor has a different obligation and responsibility than the student.

The extent to which we actually can witness a breakthrough for participatory journalism will vary from one country to another and from one context to another. Different structural features have to be taken into account in concrete studies of participatory journalism practices. Domingo and colleagues (2008) instructively demonstrate this in a study of participatory forms of journalism in 16 online newspapers in Europe and the United States. In all the newspapers they studied, only the interpretation stage was found to be significantly open to citizen participation. Beyond the comment section of the published articles, audience participation was relatively rare and diverse. Domingo et al. (2008) suggest that online newspapers' attitudes toward audience participation "are locally constructed not only in every country but also in every case, apparently shaped by specific contextual factors" (p. 335). Among such factors the following are emphasized: professional singularities, market characteristics, social particularities, and regulatory differences (p. 337).

The debate on citizen journalism and "pro-am" journalism tends to gravitate between two extreme positions. On the one hand, it is argued that a "cult of the amateur" undermines professional journalism. As a vibrant exponent of this view, Andrew Keen (2008) contends that "the ubiquity of free, user-generated content threatens the very core of our professional institutions" (p. 44). On the other hand, contributions from amateurs are celebrated for their journalistic merits and contributions to the "lifeblood of our political system" and to the "engine for our intellectual vitality" (Gant, 2007, p. 200). Journalism is a practice, an activity, not an institution, and, as Scott Gant asserts, we are all journalists now.

In order to reconstruct and maintain accountability journalism, it is, in my view, important to stick to the concept of journalism as an institution. It is in the institutional arrangement built around journalism that we find the obligations to and standards of accountability journalism. Decent journalism requires a decent journalistic institution. Citizen journalists and amateurs of different kinds, of course, can and often do deliver quality journalism. They are also free to invoke the values and norms of the journalistic institution. They might even claim the same rights as professional journalists, like "shield laws" and access privileges. But so far we do not, as citizens and news consumers, have the same right to expect citizen journalists to be committed to the values of public service and professional journalism, unless they explicitly subscribe to these values. We cannot hold any citizen journalists accountable in the same way as we do professional journalists. And we cannot expect any citizen journalist to be sanctioned when he or she commits journalistic errors and does not meet required ethical and professional standards.

The subtitle of Bill Kovach and Tom Rosenstiel's *The Elements of Journalism* (2001) reads: "What Newspeople Should Know and the Public Should Expect." Explications of what citizens should expect of journalism can be read as an outline of journalism's social contract. This contract can also be extracted from codes of ethics for journalism and other media accountability systems. Kovach and Rosenstiel's well-founded version states that "the purpose of journalism is to provide people with the information they need to be free and self-governing," and that in order to fulfill this task:

1. Journalism's first obligation is to the truth.
2. Its first loyalty is to citizens.
3. Its essence is a discipline of verification.
4. Its practitioners must maintain independence from those they cover.
5. It must serve as an independent monitor of power.
6. It must provide a forum for public criticism and compromise.
7. It must strive to make the significant interesting and relevant.
8. It must keep the news comprehensive and proportional.
9. Its practitioners must be allowed to exercise their personal conscience. (pp. 12–13)

The normative foundations of accountability journalism are implied in the concept of the Fourth Estate. Of course, journalism's watchdog role and the idea of journalism as a public good can be, and often are, mobilized in strategic action toward commercial ends. This does not make the ideal less valuable, even though many will find the following quote from Rupert Murdoch revealing: "Unless we can return to principles of public service, we will lose our claim to be the Fourth Estate. What right have we to speak in the public interest when, too often, we are motivated by personal gain?" (quoted in Schultz, 1998, p. 15). These words were uttered in 1961 – long before Murdoch became the media tycoon he is today. The legitimacy force in the concept of the Fourth Estate could be used and abused then, as it can be now. This calls for a critical treatment of the ideal; it does not mean that the ideal is obsolete.

On Journalism Studies in the Age of Reorientation

In understanding the making and maintenance of accountability journalism, I want to turn to the long-standing question in social theory of the relationship between structure and agency. The effort to construct a form of accountability journalism can find inspiration in scholarly efforts "to overcome theoretically the practical contradiction of the human condition: the contradiction between people making history (society, system, structure etc.) and history (society, system, structure etc.) making people," to quote Zygmunt Bauman (1989, p. 36). There is also something to be learned from Anthony Giddens (1979) and his persistent work to formulate a structuration theory. Furthermore, we can draw upon the economic historian Christopher Lloyd (1986, 1993) and *structurism* or *methodological structurism*.

In his reflections on historical sociology, Philip Abrams maintains that "in terms of their fundamental preoccupations, history and sociology are and always have been the same thing" (1982, p. x). His argument is that "at the heart of both disciplines is a common project: a sustained, diverse attempt to deal with [. . .] the problematic of structuring" (1982, p. x). Both disciplines are concerned with "the puzzle of human agency," and they both try to approach agency through an understanding of "the process of social structuring" (Abrams, 1982, p. x).

This very general proposition might appear as a pure abstraction with minimal relevance for practical research, but I would argue otherwise. Empirical historical and sociological research on journalism can be enriched through accompanying reflections on the enigma of human action, on “*shaping of action by structure and transforming of structure by action*” (Abrams, 1982, p. 3, emphasis added). An awareness of this problematic can also be instrumental in avoiding different versions of determinism, be they technological or economic.

By conceiving of structures as both a medium for and a result of action – by viewing structures as potentially both constraining and enabling – we are approaching a valid understanding of a changing journalism in a changing society, and we are doing this without ruling out the individual actors who make a difference in the process. The intriguing interplay of material, institutional, and symbolic relationships is at stake. According to Graham Murdock (1991), “the trick we need to learn is how to keep these two faces of communications – the material and the symbolic – in play at the same time and to explore their interplay without collapsing either one into the other” (p. 54). He further emphasizes that this ambition confronts us precisely with “the central theoretical dilemma of the human sciences – how to conceptualize the relations between social structures, cultural formations, and situated action” (p. 54).

In accordance with Giddens’s classic work on structure and action in the 1970s, we can conceive these concepts not as contradictory but as complementary terms, as faces of *the duality of structure*. By this notion, Giddens (1979) wants to express that “social structures both are constituted by human agency, at the same time that structures are the very medium for this constitution” (p. 5).

The interdependency of structure and action means that structure cannot be understood as synonymous with constraint (system compulsion) – structure is both force and choice; both restriction and incitement. Structures exist only as structural properties in a social system, which are organized as regular social practices. A typical expression of such structured social practices is an institution, which must be understood as a subcategory of system, that is, it must have an extension in time and space and be recognized by a majority of the members of a society. Journalism can serve as an example of such an institution, with its structured professional rules and resources.

In general there are two kinds of rules in Giddens’s account, normative elements and codes of signification. Resources are also of two kinds: authoritative (or symbolic) resources and allocative (or material) resources. I find it useful that this conception of resources includes both symbolic and material features. In order to understand journalism and journalistic reorientations, we have to take into account the different versions of rules and resources. Furthermore, we might be able to distinguish between enabling and constraining aspects of different kinds of rules and resources. Such an analytical tool might be useful in order to consider the impact of the changing political economy as well as changing professional values, for example, with reference to lists of journalistic norms and qualities, like those provided by

McChesney and Nichols and Kovach and Rosenstiel, discussed previously. The reconstruction of accountability is an active structuration where agents draw upon available rules and resources. Some resources, like the economic ones, might be constraining in relation to accountability journalism, while others, like professional values, might be enabling.

In his own writing, Giddens de-emphasizes the material resources to an unfortunate degree. Nor is he necessarily successful in his efforts to make “structure” a flexible concept detached from every aspect of constraint. Problems with Giddens’s conception of structure, consequently, have led even sympathetic critics to prefer other conceptions of patterns of relations, like Norbert Elias’s concept of “figurations” (Bauman, 1989) or a concept of “formations” (Murdock, 1993).

Elias’s approach offers the advantage of a processual perspective embedded through empirical studies. In Elias’s view, social phenomena “in reality can only be observed as evolving and having evolved” (1994, p. 186). To restrict the analysis to an either-or question or “to two antithetical states represents an unnecessary impoverishment of sociological perception on both empirical and theoretical levels” (p. 186). Figurations are in motion, they change, turn into other figurations, and it is therefore a research challenge “to develop one’s own imaginative capacity that one is able to think in figurations, and, moreover, in figurations whose normal characteristics include a tendency to change” (p. 215).

Lloyd’s (1993) project is to conceptualize and discuss methodological structurism, which he finds existing today “quite widely as an unexamined assumption within the explanations of many historians” (p. 7). Structures exist, as ensembles of rules, roles, relations, and meanings; they are real entities that are products neither of the theorists’ nor of the agents’ imaginations. They are not “reducible to characteristics of individuals or patterns of individual behaviour,” but they influence “the behaviour, beliefs, and understanding of persons, and they are knowable through the behaviour, products, and utterances of persons” (p. 39).

These approaches break with methodological individualism, with the idea that social categories and explanations can be reduced to descriptions in terms of individual predicates. Nor are these approaches compatible with traditional structure-oriented approaches, where the acting agents are seen as puppets in a structural web of influences. A preoccupation with the problematic of structuring can be a sensitizing device in attempts to come to terms with, or even transcend, the familiar dichotomy “creativity vs. constraint.” Rules and resources surrounding and present in the newsroom should be conceived as both media for and results of journalists’ action. Different journalistic criteria are probably more fruitfully understood as “rules” – in Giddens’s sense of generalizable procedures – than as causal explanations of journalistic behavior.

Furthermore, as Anderson (2008) emphasizes in a call for studies of changes in the “knowledge base” out of which journalists justify their work, knowledge and expertise are not static, ahistorical entities that occupational groups can seize. On

the contrary, they are flexible rules and resources on which the agents can draw in their structuring of new professional procedures.

A promising analytical strategy could, then, be described as *an institutional approach informed by a structuring perspective*. The object of study is current and historical changes in social relations, in figurations in the journalistic institution and between this institution and society – for example, in the form of relations toward other agents in the journalistic field, toward the market, media owners, political actors of different kinds, toward journalistic norms and ideals, and so on.

Here, I have referred to theory on a relatively general level, and of course it would be possible to pursue the task of understanding the development of efforts to reconstruct accountability journalism further, inspired by more concrete theories, for instance, in the realm of political economy. In that case, simplistic readings based in economical determinism could be carefully avoided. This endeavor will then be in compliance with modern versions of political economy, like the one advocated by Peter Golding and Graham Murdock (1991) using the buzz phrase “critical political economy.” They emphasize, precisely with reference to the work of Anthony Giddens, the need to integrate approaches of agency and structure, and the accompanying need to “think of economic determination in a more flexible way” (Golding & Murdock, 1991, p. 19). It certainly has been a problem in analyses inspired by political economy that the agents’ actions have disappeared or appeared as pure reflections of the structural circumstances. The interaction between structure and action – the structuring – tends to disappear.

Furthermore, in a political-economical vein we can learn a great deal from concrete studies of commercial journalism, like John McManus’s *Market-Driven Journalism* (1994). McManus is relatively refined in his distinguishing of a journalistic logic on the one side, and market logic on the other. However, in my view he gets too mechanistic and simplistic in his analysis of how structural circumstances shape the news. Through references to the problematic of structuring, this kind of study could be developed in a fruitful way.

A more recent study of “new media” and “old news” is also promising in its efforts to combine structure and action. Natalie Fenton’s volume, *New Media, Old News: Journalism and Democracy in the Digital Age* (2010), seeks to

challenge traditional divides in media and communication studies that tend to prioritize either structure (mostly from within political economy) or agency (largely situated in cultural studies) (Fenton, 2007), to reach a position that understands the place of both and seeks to uncover the dynamics of power therein. (p. 5)

There are, as we have seen, reasons to be concerned about the future of accountability journalism. There are also reasons to believe that this journalism – the journalism that feeds democracy – probably will be conducted in the future. Accountability will be reconstructed by professional journalists and by amateurs, separately and together. In a digital age and in an era of essential reorientations, core values of the institution

of journalism are in need of active reinterpretations and support. In order to understand and sustain necessary reconstructions of accountability journalism, researchers have to account for an intriguing interplay between agency and structures.

Mending the Gaps

Connecting Media Policy and Media Studies

Victor Pickard

ABSTRACT

In this chapter, Victor Pickard explores the systemic disconnect between media studies and media policy. By situating this gap within historical, intellectual, and ideological contexts, he proposes possible strategies for bridging the two areas. He suggests that, contrary to many assumptions and practices, media studies scholars should directly engage with media policy debates of critical import. The chapter addresses some of the challenges and opportunities for scholars to intervene in core media policy debates in the coming years, including discussions about the future of journalism, media ownership, public media, and Internet policies like net neutrality. Pickard concludes by arguing that media studies and communication scholars have a special role to play in helping to advance policy that enables greater democratic potentials for all of society.

Media studies and media policy would appear to be natural allies with deep affinities. But a number of barriers frequently hinder what should be a fruitful interaction. Bridging this divide would mutually benefit both areas. While media policy debates occasionally have been enriched by scholarly input in the past, the proliferation of media-related challenges facing society today calls for much more engagement from the academic community. Indeed, at perhaps no other time in living memory have

both the stakes for such debates been as high and the opportunity for scholars to intervene as great.

The field of media studies would also benefit from such a symbiotic relationship on at least two levels. First, the professional realm of media policy – including research positions at regulatory agencies, think tanks, nonprofit advocacy organizations, congressional offices, and other policy-oriented institutions – could serve as a viable career choice for PhDs who increasingly are seeking alternatives to academic jobs. Second, for the field of media studies to remain politically engaged in ways that affect people’s everyday lives, and to encourage public scholarship, scholars must be in conversation with key media policy debates – debates ranging from the future of journalism to core Internet policies like net neutrality. Institutions connected to media policymaking stand to gain from an influx of academically trained professionals who command a strong foundation in historical and theoretical orientations – a kind of training that only rarely comes with law degrees and other areas of expertise. Unfortunately, persistent ideological constraints, both inside and outside the academy, too often undercut these potentials.

The following chapter will address some of the challenges and opportunities for scholars to engage with media policy debates in the coming years. The primary focus will be on the US academic and media policy scenes, but much of the analysis could also apply to global relationships like Internet governance issues and neoliberal policy regimes (Pickard, 2007). Media studies and communication scholars arguably have a special role to play in advancing policy that creates greater democratic benefit for all. In particular, they can perform a number of roles and functions, ranging from pedagogy to advocacy, that can help connect dots and mend divides between theory and praxis, and between the academy and the political sphere of media policy.¹

Historicizing the Disconnect and Revising the Revisions

The divide between media studies and more politically engaged policy projects stems from several historical, institutional, and political factors. Tracing back to the origins of the field, scholarly interventions into the US media system have been discouraged by a “dominant paradigm” favoring scientific approaches to media processes that concluded media had little effect on public opinion and behavior. Although sometimes scapegoated as a convenient straw man, this “limited” or “minimal effects” tradition arguably has helped depoliticize media scholarship by relegating larger questions about ideology and power to the field’s intellectual margins. Notable exceptions, as well as revisions to familiar critiques, are increasing. For example, Pete Simonson (2008) notes that those who wish to dethrone the minimal effects model are too quick to ignore the richness of the research produced by the Bureau of Applied Social Research, much of it by women like Thelma Anderson, Thelma

McCormack, and Joan Goldhamer, who conducted qualitative, particularistic, and multi-method research. Furthermore, Paul Lazarsfeld and, in particular, Robert Merton (Simonson, 2006) included more critical descriptions of media influence early on in their work that official histories of the field often neglect. They identified, for instance, that significant social functions of mass media, such as “status conferral,” “enforcement of social norms,” and the “narcotizing dysfunction,” helped encourage conformist behavior (Lazarsfeld & Merton, 1948).

Nonetheless, these critical observations of how media serve as mobilizing agents largely receded as minimal effects became sanctified within the field. All too infrequently noted, however, is that the minimal effects model, codified in the discipline’s DNA by both detractors and defenders, was not foreordained. This is especially true when considering C. Wright Mills’s reservations toward some of the same data that girded Katz and Lazarsfeld’s (1955) conclusions that media, after all, had relatively little impact on people’s opinions and behavior – that instead, media effects were socially mediated and influence was transacted from media via “opinion leaders” in a two-step flow process through interpersonal networks. Mills, the leading researcher on the so-called Decatur study, questioned the interpersonal communication processes emphasized in what became the foundational book *Personal Influence*. Noting the lack of analysis related to social “stratification,” Mills drew on some of his more critical observations to pen his 1956 classic *The Power Elite*, which emphasized the role of concentrated, hierarchical power in US society that was largely missing from the Decatur study. Indeed, more recent work on the Decatur study’s origins – particularly Mills’s role – suggests a largely ignored alternative history (Sterne, 2005, pp. 71–76; Summers, 2006, pp. 33–37).

Such revisionist histories are on the rise but often do little to challenge the overall depoliticized trajectory of communication studies. Historically within the field of communication and media studies, more critical explanations of structural relationships such as those advanced by the *Power Elite* often have been neglected in favor of research that remains largely descriptive, noncritical, and micro-phenomenal. As chronicled in Lent’s book *A Different Road Taken* (1995), for the few radicals in the field’s early days like Herb Schiller and Dallas Smythe, being critical scholars was a lonely battle. A similarly forgotten trajectory can be discerned in Dallas Smythe’s memoirs, in which he wrote the beginnings of an oppositional counternarrative to the seminal *Four Theories of the Press* (Siebert, Schramm, & Peterson, 1956). While his University of Illinois colleagues in the newly founded Institute of Communications Research (ICR) held forth on the social responsibility model, Smythe challenged them publicly and wrote screeds privately, characterizing their work as public relations for the commercial press, “equivalent in class and political economic terms to the press doctrine in the Soviet Union” (Smythe & Guback, 1994, p. 96).

Paradoxically, red-baiting would serve a role in both containing radical critiques and forcing radical scholars into the academy to escape political repression. Smythe had been red-baited by reactionaries in DC for his progressive views and again when

he first arrived at the University of Illinois.² Around the same time, another red-baited figure from postwar media policy battles, Charles Siepmann, took refuge in the academy. An early BBC pioneer and the primary author of the infamous Federal Communications Commission (FCC) Blue Book, Siepmann helped found a communications department at New York University (Pickard, 2011a). That at least two of the first communication departments not only were engaged with media policy but also harbored radical scholars dedicated to a critical orientation toward media studies suggests a heterodoxy of alternative, radical traditions not contained within official narratives. Nonetheless, it is this dominant paradigm, driven by social science research focused narrowly on media effects, which ascended, and has continued to figure centrally in histories of the field of communication.

This trajectory was not inevitable. Both Dan and Herb Schiller note the strange irony that at the exact moment the US national security state was enlisting liberal intellectuals and communication scholars to create a propaganda apparatus for nascent overseas Cold War efforts, some of these very same scholars were advocating that media have limited effects on public opinion. This contradiction would not be as glaring if it were not for the scale of their propaganda projects, as Holly Shulman (1990) describes in her history of the Voice of America. Brett Gary (1999) chronicles the debates among the “nervous liberals” who decided to keep the propaganda apparatus intact after World War II. Chris Simpson (1994) goes so far as to suggest that the field of communication would not have been institutionalized if it were not for the massive influx of governmental monies for propaganda purposes. Dan Schiller (1996) describes how “the purportedly ‘limited effects’ of the mass media were elevated by mainstream research only as the structural underpinnings of institutionalized communication were willed off limits” (p. 59). Noting how such a narrow focus keeps concerns about social relations at arm’s length, Herb Schiller observed that “[minimal effects’] usefulness to existing power is obvious” (1991, p. 146). He also asserted that even the model’s proponents acknowledged that such findings pleased media owners who felt absolved from accountability (p. 137). In response to the rise of active audience research, Herb Schiller argued, “theories that ignore the structure and locus of representational and definitional power and emphasize instead the individual message’s transformational capability present little threat to the maintenance of the established order” (p. 156). Moreover, he noted how limited effects emerged as the dominant explanatory model for media within the United States precisely at the same time that a model of powerful or “strong effects” was being deployed outside US borders. Todd Gitlin (1978) similarly noted how the focus on propaganda techniques seemed oddly discordant with the overall limited effects thrust of the field, yet he observed that this “strange conjunction of events is not without its logic” (p. 205).

Gitlin’s well-known intervention against the dominant paradigm underscores the fraught relationships between media scholars, their models, and larger political economic structures. Gitlin cast the role of mainstream communications scholars, especially practitioners of the dominant tradition of minimal media effects, as serving

the hegemonic power of capitalist society by playing a role in its reproduction and managing the status quo. In mainstream communication scholarship, he sees an allegiance to the status quo embedded in positivistic, quantitative methods, which have, according to Gitlin,

drained attention from the power of the media to define normal and abnormal social and political activity, to say what is politically real and legitimate and what is not; to justify the two-party political structure; to establish certain political agendas for social attention and to contain, channel and exclude others; and to shape the images of opposition movements. By its methodology, media sociology has highlighted the recalcitrance of audiences, their resistance to media-generated messages, and not their dependency, their acquiescence, their gullibility. (pp. 205–206)

Gitlin saw Lazarsfeld's conception of "effect" as defined narrowly to lend itself to measurement in a strict behavioral and replicable sense, thereby erasing connections to larger sociopolitical meaning and decontextualizing political relationships. Gitlin uncovered a list of what he saw as faulty assumptions underlying such work that looked for effects that were the least likely to manifest:

[Mainstream communications research] has looked at effects of broadcast programming in a specifically behaviorist fashion, defining effects so narrowly, microscopically, and directly as to make it very likely that survey studies could show only slight effects at most. It has enshrined short-run effects as measures of importance largely because these effects are measurable in a strict replicable behavioral sense, thereby deflecting meaning from larger social meanings of mass media production. (p. 206)

Gitlin also criticized the focus on "reinforcement" without expanding on ramifications such as long-term, ideological effects.

To be fair, Katz (1987) and others have countered that media effects models have not remained static and continue to develop alongside competing alternative theories. Lending weight to Katz's observation is the fact that scholarship over the past 20 years has gone far in updating the minimal effects model and clarifying its limitations. These modifications and corrections to the earlier minimal effects model range from agenda setting to framing to priming. More recent meta-analysis suggests that despite the conventional narrative that effects research has evolved according to three distinct phases (powerful, minimal, not-so-minimal), "the research corpus in media effects documents a very impressive range of effects from no effect at all to very large effects" (Neuman & Guggenheim, 2011, p. 173).

Demonstrating how quantitative methods can produce radical research is the exemplary work of George Gerbner (1980) who pioneered work on long-term, cumulative media effects, such as those demonstrated by what he termed the "mean world syndrome" – that repeated, long-term exposure to violent television imagery led to a skewed view of the outside world as inordinately hostile. His work had a profound impact on policy debates and would culminate in the "cultural environment" move-

ment. Similarly, quantitative approaches to media analysis were also prominent in early radical communication research – including Smythe’s content analyses of broadcast media – and continue to be a mainstay in media reformers’ efforts to illustrate how media fail to adhere to prescribed public interest obligations.

In short, even from a critical point of view, pluralistic approaches to media studies are necessary to encourage diverse conceptualizations of power. Although the cultural turn in communication studies prompted a number of radical scholars to argue that the field’s depoliticization only worsened (McChesney, 2007), radical scholarship on the whole has arguably become more entrenched in recent decades. To be sure, tensions continue to play out among various critical traditions – for example, in their call for a “critical media industry studies,” Havens, Lotz, and Tinic (2009) felt compelled to dismiss academics located in the Schiller and Smythe traditions “who maintain an unreconstructed Marxist theoretical framework” (p. 237). On a similar note, Henry Jenkins (2006) criticizes media reformers, whom he dubs “critical pessimists,” as relying too much on “melodramatic discourse about victimization and vulnerability” and thus ignoring the “complexity of the public’s relationship to public culture” and thereby siding “with those opposed to a more diverse and participatory culture” (pp. 247–248).

But these critiques notwithstanding, it would be fair to suggest that many of the old schisms have begun to recede. In their place, one may hope, is a more constructive approach to social problems that draws from a variety of media studies traditions. In the end, nearly all media policy research should be welcome, but there is a special role to be played by what can be termed “critical media policy studies,” an approach rooted in several of the field’s obscured critical traditions.³

A Call for Critical Media Policy Studies

A critical orientation can help galvanize a more activist intervention in media policy debates. By critical orientation I mean “an explicit skepticism toward dominant institutions, ideologies and social relations and implicit commitment to a more democratic, egalitarian, and human social order” (McChesney, 1993, p. 98). A related term is “radical,” describing scholarship that penetrates to the roots of core power relationships. Uncovering the normative foundations of power, particularly as they relate to media, should be the first objective of critical media policy scholarship – an objective very much in line with classical democratic theory. Indeed, Thomas Jefferson issued this important warning: “A democracy will not long endure without frequent return to fundamentals” (quoted in Siepmann, 1948, p. 27). In looking at the role of media in a democratic society, returning to some fundamental democratic theory could be useful, beginning with classics put forth by the likes of Locke, Milton, and Jefferson, and including more recent work by scholars like Starr (2008) and Christians, Glasser, McQuail, Nordenstreng, and White (2009). Where the latter discuss media’s

normative underpinnings, Paul Starr (2008) puts forth a typology of three democratic theories of the press.

Within Starr's model are, on the one hand, minimalists who favor a libertarian media environment characterized, for example, by adversarial electoral campaigns. Minimalists believe that the market will effectively govern the media system, obviating any need for governmental oversight. At the other pole, according to Starr, are radical democrats who favor greater egalitarianism in media, as in all other sectors of social life, and see a potentially progressive role for state intervention to guarantee this social democracy. "In regard to communications, the radical democrat sees the market as a corrupting influence that degrades political discussion and reinforces what used to be described as the cultural hegemony of the capitalist class and is now usually just characterized as the dominance or 'monopoly' of big media corporations" (p. 37). Starr describes the radical narrative as one that "views the rise of commercial mass media under the control of large corporations as a betrayal of the original promise of the public sphere and a free press" (p. 40). Emphasis is placed on the "suppression of alternatives," including "the voices of marginalized groups and dissident journalists" and of "alternative policies that might have limited the dominance of the corporate media" (p. 40).

In Starr's view, the more sensible model is the third option, one he calls the "liberal deliberative" model. This model "does not presuppose that power must be equally distributed among citizens, nor does it count on high levels of everyday popular engagement in public affairs" (p. 37). According to Starr, "these goals, while admirable, are so removed from the realities of modern society that they cannot be conditions for political legitimacy" (p. 37). Implicit in Starr's advocacy of the liberal deliberative model is a critique of the radical approach, although he goes no further than to suggest that equitable power distributions and popular political participation simply cannot, *a priori*, be considered legitimate options. I would suggest that Starr's position is symptomatic of a major weakness of the liberal view that fails to prioritize contesting long-standing structural inequities. Although Starr gives a fair assessment of the radical political economic view, one more critical piece should be added: the radical approach assumes scholars should engage with the public to advocate for a more democratic media system.

Signs that critical policy studies are being taken more seriously in the field of communication are increasing. In recent years, national associations have held special panels for a critical approach to policy, and a number of pre-conferences and working groups have emerged to create more discursive space and allocate more resources for this growing subfield. An important collection of essays showcasing recent activist and scholarly collaborations around media policy reform is a promising development (Napoli & Aslama, 2011). Another recent edited collection served as an intervention in telecommunication debates during the lead-up to President Obama's election (Schejter, 2009). Nevertheless, critical policy studies remains a relatively minor subfield kept on the field's periphery. Among those few policy scholars working in communications departments, even fewer are conducting policy research from a critical orientation.

The Critical Political Economy Approach to Policy Studies

While critical traditions of all stripes lend themselves to policy-oriented media studies, the “critical political economy” approach is arguably the most obvious vehicle enabling structural interventions. Exposing the roots of social problems, political economists often ask questions that powerful interests – along with most mainstream research and society in general – have determined “out of bounds,” lying beyond normative, polite, and rational debate. A political economy of communications must have at least two components. First, assuming that media are central to any society, it must situate a nation’s communication system within larger social relationships and political structures. This includes interrogating how the media system challenges or reinforces power hierarchies and established interests, including how it figures within global regimes of power and imperial projects. Second, a political economy of communications should examine the structure of the communications system, including ownership, profit structures, support mechanisms (e.g., advertising and public relations), and enabling government policies. This last component can be separated out into a third mode of inquiry deserving its own category: an examination of the specific policies that give rise to a particular media system.

Political economy’s communication origins can be traced back to primarily two sources: the Institute of Communications Research in the United States and the “Westminster school” in England. Dallas Smythe initiated the former after he, like many radicals before and after him, took refuge in the academy. After essentially fleeing his post as the first chief economist at the FCC in Washington, DC, Smythe taught the first political economy course in the new field of communications. Herb Schiller took his place in the ICR when Smythe departed for an academic position in his native Canada. Smythe and Schiller would go far in establishing political economic inquiry, investigating the commodification of culture, production of media consumers, and media operations vis-à-vis US imperialistic projects.

Nicholas Garnham, James Curran, and other prominent British scholars established the Westminster school in England (Curran, 2004). Garnham’s work (1990) was inspired by a previously understudied argument by Raymond Williams, in *Marxism and Literature*, that media and cultural production should be treated as inseparable within capitalist production. In other words, a political economy of communication should figure prominently in any critical inquiry seeking to make sense of how power is inscribed and reproduced in culture. Around the same time, other British scholars including Graham Murdock and Peter Golding (1974) also made the case for a political economy of communications by examining the role of media systems within capitalist market relationships.

Many scholars of political economy drove home the fact that there is nothing natural or foreordained about media systems; they do not spring forth from Zeus’s

head fully formed. Instead, they are the direct result of explicit policies that resulted from an intensely political process. It is the job of critical political economists of media to ruthlessly scrutinize these policies, exposing their contingencies and contradictions. A crucial goal of political economists is to emphasize the power structures that produce any given media system. In the United States, or any capitalist society, this means that we must explore the reinforcing mechanisms of class divides, such as the role of corporate lobbying in media policymaking and the conservative onslaught against civil society institutions that has become increasingly mainstreamed in recent decades. A core component of political economists' project is a prescriptive social mission that entails a normative and even ethical commitment: to assist processes of social change aimed at effecting a stronger democratic society. In many cases this means butting up against status quo assumptions and assailing neoliberal capitalist hegemony. Indeed, distilled from the work of leading political economists is the assumption that disrupting orthodoxy is an essential part of the project (Gandy, 1993; McChesney, 2008; Mosco, 1996).

In short, critical scholars should bring to light core injustices in our institutions, power relationships, and received assumptions by exposing the language and narratives that get deployed in ways that recreate, bolster, and inoculate power asymmetries from interrogation. The legitimacy of these enabling narratives should be called into question. As we aggressively scrutinize these social relationships, which so often serve as apologetics for the status quo, we are guided by at least an implicit commitment to social justice. Increasingly, the current system, which perpetuates power asymmetries and primarily serves in the capital accumulation process, is no longer tenable, especially given the increasing economic inequality in the United States, as well as the detrimental impact of corporate power in the wake of developments like the Supreme Court's decision in *Citizens United v. FEC*.⁴

Contextualizing the Big Picture and Returning to the Normative

In today's context of technological, political, and social change, we have reached a "critical juncture" of historic import (McChesney, 2007). As a prerequisite for engaging with media policy at this juncture, scholars must penetrate through the constraints of the reigning "American media policy paradigm" (Pickard, 2008). This discursive framework characterizes most DC-based media policy discussions, and favors technological and economic considerations at the expense of normative and democratic ones.⁵ Such an orientation tends to systematically neglect the politics of policymaking, thus ensuring that structural understandings and prescriptions for reform are kept off the table. This paradigm was evident when pro-industry groups that were aligned against mandated net neutrality attempted to portray the debate as being primarily technical instead of concerned with core democratic concerns.

FCC Commissioner Robert McDowell epitomized this position in a *Washington Post* op-ed in 2008. Referring to crucial Internet policies, he asserted that “engineers, not politicians or bureaucrats, should solve engineering problems.” The reduction of media policy to solely technical concerns and questions of efficiency is an age-old trope, recurring over the decades to contaminate debates ranging from spectrum management policy to the ownership and control of media outlets. This strategic framing has consequences: any project that depoliticizes media policy issues also undermines media reform efforts.

To counteract this misinformation, it is incumbent upon scholars to help bring crucial context to light in discussing media policy – context that *politicizes* media policy debates.⁶ By insisting that we include politics, history, and normative understandings in policy discussions, scholars help connect media policy to larger matters – matters that typically fall within the purview of scholarly debate. For example, as we account for technological changes in media systems, we can address political economic issues pertaining to the ownership and control of media infrastructure. We can ask historical questions about policy antecedents and recover alternatives while showing that the status quo is contingent on political practices (Pickard, 2010b). Finally, we can pose normative questions and advance policy prescriptions that would benefit the most people by enabling a more democratic communication system.

In addition to recovering crucial context for media policy debates, media scholars can participate in the policymaking process in at least three ways. First, we can draw from our scholarship to contribute to policy proceedings and provide reports and memos to policymakers. For example, public comment periods at the FCC and other agencies provide an opportunity for scholars to submit written statements and even entire journal-length articles that may enlighten policy discussions. Furthermore, staffers in congressional and regulatory offices are often receptive to bullet-pointed summaries of scholarly work explaining policy positions and their anticipated effects. Second, media scholars can publish popular media like op-eds, blog posts, and magazine essays to help clarify what is at stake with specific media policies. Finally, we can help engage our students in the policymaking process, encouraging and enabling their participation. I have found when discussing these issues in the classroom that my students are very receptive if I can show how policy decisions directly affect their everyday lives. For instance, policies regarding intellectual property, net neutrality, and media ownership have a major impact in shaping their daily Internet use. After demonstrating these connections, I set up classroom activities and assignments in which students create their own policy proposals addressing major media-related problems.

The overarching theme for all these approaches is that media scholars should help clarify policy issues for public consumption while encouraging people to directly engage with the policymaking process. Oftentimes, policy issues are not overly complicated but have been strategically distorted by commercial interests who stand to gain from particular outcomes. Along with net neutrality, the national debate on media ownership is another useful case study of how large sectors of the public

engaged to dramatically alter a crucial policy debate. The historical record suggests that if media policy issues are debated openly with an engaged public, the case for media reform becomes paramount. Toward these ends, we must constantly remind policymakers that when we talk about net neutrality, we are not talking about simply the mechanics of a “series of tubes” but rather the future of meaningful democratic communication in US society. When we talk about managing the public airwaves, we are not merely looking to fill gaps in the federal budget by auctioning off monopoly rights to electromagnetic spectrum to the highest bidder, but instead we hope to enable more diverse voices and information within our national discourse. And when we talk about the collapse of journalism, we are not talking about just a bad turn in the market or an inevitability of technological progress but a tragedy that is striking a core institution indispensable for democracy.

Indeed, to take just one example, the future of journalism is perhaps the most important media policy debate facing society today. Daily reports on the state of the press read like obituaries, with newspapers verging on bankruptcy or even closing, hemorrhaging jobs and ad revenue, dismantling foreign and DC press bureaus, and eviscerating local, international, beat, and investigative reporting. Other news media offer little solace, with broadcast and cable news devolving into shrill commentary, and online journalism defying monetization. But often missing from these laments is an even deeper crisis: the institution of journalism is dying before our eyes, a tragedy that goes beyond the decline of newspapers to strike at the foundations of democratic self-governance. Given the systemic failure of advertising-subsidized news and the vacuum left by its demise, it is not hyperbolic to assume that decisions made during this critical juncture will largely determine what news media will look like for decades to come. Assuming that no silver bullet or easy policy fix exists, we must ask the question: What will take the place of traditional commercial news media (McChesney & Pickard, 2011)?

First and foremost, this crisis demands a period of vigorous experimentation (Pickard, 2010a). It is also an opportunity to jettison what is bad with our current news media system, salvage that which is good, and push forward with entirely new models. Scholars can aid this process by recuperating models for possible alternatives. My particular focus in these efforts is to draw from historical and comparative analyses of international models to provide a picture of structural alternatives for journalism that either have worked – or were seriously considered – for some duration in the past, or are in operation somewhere in the world today (Pickard, 2011b). These models include nonprofit, municipally owned, cooperatively governed, and worker-run media, with institutional support and funding through tax incentives, public subsidies, foundation support, and other creative hybrids. This kind of research is a necessary first step in assessing the viability of alternative models and determining the policies and practices that can enable these institutions in ways that best serve the democratic needs of diverse communities.

Moreover, scholars can help devise policies that would benefit the most people (Meinrath & Pickard, 2008; Pickard & Meinrath, 2009). When caught up in ongoing

policy struggles, it is easy to lose sight of the necessity of historical perspective. However, historicizing contemporary policy debates is one tangible way that academics can help. Furthermore, they can help move the discourse from developing that contextualization to then communicating it to the public and key stakeholders in a way that can prompt action toward creating a more vibrant and democratic media system.

What Media Scholars Can Do

Media scholars can also help incubate alternative communication models by keeping radical visions alive and advancing them at more opportune moments, particularly during times of crisis. They can also facilitate linkages between the political world of media policy and academic communities. To be sure, while the field of media studies should engage with key media policy debates of the day, this does not mean that every media scholar should be expected to do work that directly intersects with media policy issues. But it should mean that a critical mass of scholars is doing such work. Judging from the florescence of media policy centers, conference panels and workshops, special issues of journals, foundation-supported research, job openings for tenure track media policy positions, and many other signs, a recent surge in academic interest toward media policy is evident. Yet there are still many communication departments that lack a single faculty member who works on such issues.

While the stakes for media policy debates and the opportunity for academic interventions are both great, my own participant observations from time spent working on media policy in Washington, DC amply demonstrated that engagement requires more complicated processes than scholars simply jumping into the fray. One barrier is that it can be difficult to match scholars' skill sets with particular policy problems. A second is that many scholars tend to think of policy in more abstract theoretical terms that do not always neatly map onto praxis. But perhaps the most difficult barrier is that the imperatives of the policy world – like rapidly responding to ever-shifting political landscapes and meshing research objectives with legislative and regulatory processes – do not always lend themselves to those of the academy – like publishing in academic journals, teaching classes, and working toward tenure. A major obstacle to academics becoming more involved in the policy process is that, without direct professional benefits, their time spent on these issues can seem like even more unpaid service labor in a sector that is increasingly exploited.

Nonetheless, there is much that scholars can do that satisfies multiple aims. And while we should be honest that academics infrequently produce work directly applicable to lobbying efforts, scholars have resources that advocates do not. They have time, authority, and expertise. They can connect with students and other constituencies. They can draw from a knowledge base that lends itself to a long critical view of policy battles. In general, scholars can help recontextualize and repoliticize media policy debates.

A renewed interest in media policy scholarship has been concomitant with a rising number of think tanks, particularly on the political left like the New America Foundation and the Center for American Progress, which have begun to focus more on media policy issues. Additionally, joining long-standing policy fora like the annual Telecommunication Policy Research Conference is the work of policy centers like Harvard's Berkman Center for Internet and Society, Yale's Information Society Project, and Michigan State University's Quello Center, to name just a few. The Social Science Research Council (SSRC) has been centrally involved in media policy reform in recent years, as have groups of scholars at Penn State and the University of Texas, Austin. Media reform organizations, particularly Free Press, maintain strong connections to a number of media studies scholars, temporarily launching the "Academic Braintrust" (a tongue-in-cheek name) to form working groups on various media policy issues. Another interesting experiment that combines media scholarship with hands-on media policy experience is the consortium on media policy studies program (COMPASS, for which I served as a fellow in 2005). Originating with the two Annenberg schools, the University of Illinois, and the University of Michigan, this program coordinates graduate student summer fellows in a number of congressional and mostly nonprofit offices where participants are immersed in the policymaking process (Newman, 2009).⁷

While questions will continue about how media scholars can get more involved in policy and make policy more central to media studies, given the current media landscape of technological and political change, opportunities for structural reform are plentiful. By connecting media policy issues and debates directly to people's everyday lives, scholars can foster good public scholarship and provide analytical tools to the public that encourage their engagement with media policy.

Historicizing Media Policy Debates

When considering how we can design a media system that serves democratic society, we need to look to our past for lessons about the future. We need to be aware of previous policy debates both to understand how we got here and to learn from previous errors. One important lesson comes from identifying a recurring theme found in previous policy debates: the delegitimation of government intervention in general, and of media regulation in particular. The late C. Edwin Baker (2010) noted that the two arguments media industry representatives typically used to discredit public policy interventions in media were the following: first, that the government has no legitimate role in markets, and second, that the First Amendment forbids government intervention in media markets specifically. Both charges are demonstrably false. The government intervenes in markets all the time – usually to aid corporate profit – and, based on important Supreme Court decisions and other interpretations, the First Amendment can be seen as *mandating* that the government provide the

support necessary for a healthy media system. Nonetheless, pro-industry ideological blinders will continue to pose an insurmountable barrier to all progressive media policy unless we dismantle them. And the best starting point for such a project is to turn to our history.

One such historical analysis put forth by the late Tony Judt (2010) illustrates that the deregulatory turn away from social democratic orientations in the latter half of the twentieth century was marked by an emphasis on efficiency to the detriment of ethics. As a society, Judt observed, we stopped asking whether policies are good or just and instead began asking whether they are efficient and profitable. This neo-liberal turn, often traced to the 1970s, actually began in media policymaking as early as the postwar 1940s (possibly even earlier). What was chiefly an unpopular corporate consensus in the 1940s has now been elevated and adopted by a quasi-grassroots social movement in the form of the so-called Tea Party (Pickard, 2011c).

In short, it is important that we have the intellectual clarity, coupled with political will, to correct the historical record. Among policymakers and pundits it is often noted without much reflection that the “public interest” standard has remained frustratingly ill defined. While it is true that previous attempts to define standards have been fraught with conflict and difficulty, the term “public interest” has not been left undefined by lack of effort. Rather, it has remained ambiguous because industry interests fought aggressively to make it so. Previous policy clashes, where media industries prevailed, resulted in these decontextualized, ahistorical, and depoliticized narratives that, in turn, help perpetuate industry-friendly policy arrangements. Perhaps the clearest example of this phenomenon occurred in the 1940s when red-baiting successfully thwarted a social democratic approach to media policymaking (Pickard, 2010b). This history matters now because, once again, “nervous liberals” (Gary, 1999) are backtracking on structural interventions in deference to industry-friendly media policy proposals. Most recently, the policy debate around net neutrality exemplifies where a great abdication has occurred on the part of regulatory agencies like the FCC. Media ownership issues, exemplified by the Comcast–NBC merger, testify to the corporate capture of the media regulatory apparatus.

Conclusion

To summarize, media scholars can best advocate for reform via their own scholarship and popular writings, and by engaging their students as well as fellow scholars and the broader public. Through publicly engaged scholarship and writing for popular audiences, academics can help clarify what is at stake and provide analyses toward addressing media policy-related problems. Advocating for reform does not mean we must compromise our work; simply providing empirically grounded research accessible to constituencies beyond the academy helps make our work relevant and useful for media reform. By connecting how media policy issues and debates directly affect

people's everyday lives, we are doing our job of providing good public scholarship. Given the current media landscape of technological and political change, opportunities for structural reform are myriad. Media policies that will influence our democracy for the coming decades will likely be determined during this current critical juncture. Media scholars have much to contribute to these debates. It is our responsibility to provide analytical tools to the public that encourage their direct engagement with media policy. We must break through the ahistorical and apolitical limitations of the US media policy paradigm if we are to establish an ethical and democratic media system for the twenty-first century.

NOTES

- 1 Although I specifically address academic involvement in media policy debates, much of this discussion relates to debates about the role of the "public intellectual." This broader context, although beyond the bounds of this chapter, strikes at the heart of foundational questions about the purpose of knowledge production, universities, and higher learning within a democratic society – all important discussions that deserve much closer attention than I am able to offer here.
- 2 Smythe's papers at Simon Fraser University indicate that he later discovered that while at the ICR he was being surveilled for the FBI by the departmental chair, Wilbur Schramm.
- 3 One potentially fruitful conversation is between "critical media policy studies" and "critical cultural policy studies." Even if they are generally distinct from one another in terms of emphasis, they share some key assumptions, such as the following: "Critical cultural policy studies must concern itself with progressive politics, and take its touchstone as much from social movements as from policy infrastructures" (Lewis & Miller, 2003, p. 8).
- 4 *Citizens United v. Federal Election Commission*, 558 U.S. 08-205 (2010) was a landmark US Supreme Court decision that determined, based on First Amendment grounds, that corporations cannot be limited in spending money for political broadcasts in support against specific candidates during election campaigns.
- 5 It should be noted that there are normative implications in the more conservative research. For example, Wilbur Schramm and other founding figures of the field of communication made a case for what media systems in the developing world *ought* to be like (i.e., like Western media systems, which Schramm and others saw as inherently superior and democratic, precisely because they were defined by and supportive of a capitalist model of development).
- 6 These efforts to counter a narrowly technical framing of media policy could also benefit from the work of scholars who argue that technologies have politics. See, for example, Langdon Winner (1986).
- 7 Corporations such as Google have also helped spearhead similar summer fellowship programs that provide policy training. These kinds of fellowships give beneficiaries valuable training and insider experience. Many of Google's policy positions are aligned with those held by nonprofit public interest groups and it tends to maintain a laissez-faire relationship with the nature of the fellowship work, placing fellows in ideologically diverse think tanks and advocacy groups. Nonetheless, these relations also present problems and contradictions inherent in having corporations fund media policy fellowships.

From Audiences to Media Subjectivities

Mutants in the Interregnum

Jack Z. Bratich

ABSTRACT

In this chapter, Jack Bratich argues that, even as “the audience” is in crisis in the digital media era, we can still learn much from examining the construction of that audience. The audience itself is a convergence of discursive problematizations of what Bratich calls “media subjectivities.” This chapter explores a number of these problematizations in order to extract the specific dynamics of “the audience” that are still relevant, including relations between individuality and collectivity, activity and reactivity, composition and organization. Ultimately, Bratich argues, audience studies reaches a limit with the emergence of interactivity, but a limit that allows us to productively mine the past for new ways of thinking about media subjectivities.

The current media age has been described as one of transition and an interregnum, an in-between age marked by uncertainty, experimentation, and unpredictability (Jenkins, 2006; Levy, 1997). This era is one of transformation in which old categories disappear and new ones take their place. These assessments are often filled with optimism and a faith in progress. But in-between states are not solely times for improvement. Antonio Gramsci (1971) describes such states as a crisis in which “the old is dying and the new cannot yet be born: in this interregnum, morbid phenomena

of the most varied kind come to pass” (pp. 32–33). The interregnum produces change, but this change is best defined as a series of *mutations*. While we are not able to predict what will arise, we are obligated to evaluate the mutants we are becoming, as new hybrids bring with them a “terrible ambiguity” regarding their powers (Negri, 2003).

What are the new mutations in media studies? What is living and what is dead? Better yet, what is *undead*? These questions seem especially pertinent when addressing one of the traditional objects of media study: the audience. Has the audience disappeared along with mass or broadcast media? Has it turned into something else? Perhaps the “people formerly known as the audience,” as Jay Rosen (2006) puts it, can tell us, in their monstrosity, something of the history of audience studies. The moments of dissolution of certain paradigms allow researchers to see the hegemonic epoch differently. Remediation thus does not just apply to technological form and content but to the *concepts* that accompany those forms. Here we will explore some of those concepts, specifically ones relating to the media subjects called audiences.

This chapter argues that we can still learn much from examining the construction of that audience. Key terms in contemporary new media studies (e.g., convergence, collective intelligence, interactivity) carry with them a series of issues that have surrounded the discursive construction of audiences throughout the twentieth century, namely the dynamics of power relations and subjectivity. The audience itself is a convergence of discursive problematizations of what we could call “media subjectivities.” This chapter explores a number of these problematizations in order to extract the specific dynamics around them that are still relevant, including the relation of individuality and collectivity, activity and reactivity, composition and organization. Ultimately, I argue, audience studies reaches a limit with the emergence of interactivity (and its mutations interpassivity, interactivism, and inter-reactivity), but a limit that allows us to productively mine the past for new ways of thinking about media subjects.

Problematizing the Audience

As a number of scholars have noted, “the audience” is a construction (Alasuutari, 1999; Allor, 1998; Ang, 1992; Bennett, 1996; Hartley, 1992). Specifically, different ways of conceptualizing the audience are the product of *problematization*, which Michel Foucault (1988) defines as “not the representation of a pre-existing object, nor the creation by discourse of an object that does not exist. It is the totality of discursive and nondiscursive practices that introduces something into the play of true and false and constitutes it as an object for thought” (p. 257). These problematizations have a history that needs studying.

The audience has been an object of concern, sometimes a “problem” or threat, other times a source of anxiety, and at others a target for cultivation (Bratich, 2005).

The audience is a result of a particular configuration of power/knowledge: as a category, it emerges from various agents, institutions, and desires. These are more than ideas, as *practices* follow problematizations. The audience acts as anchor and alibi for a variety of decisions (public policy, educational, corporate production, cultural programming, funding, domestic rules).

The field of media studies needs not merely to *recover* the problematizations of the audience but to *reopen* them. The future of the audience is in its virtuality – its pre-forms that have not yet been actualized. A virtual, as Pierre Levy (1998) defines it, involves cracking open an actual to reveal the knot of tendencies or forces that invoked a resolution (the actual). Actualization is more than a selection among already constituted alternatives (a realization of one possible among possibles). Rather, it constitutes a *solution* to problem(s). Any entity (in this case a settled notion of an audience) invokes the *specter* of the improbable, the fluctuation, and thus the virtual (Terranova, 2004). Investigating the audience means asking: what are the knots that gave rise to the solution only to be occulted afterward?

What happens when we remediate and reopen a concept like audience? We not only account for the myriad associated concepts (mass, public, popular, identity, receiver, citizen, consumer) but open up the volatile tendencies that prompted *both* a number of possibles and the actual solution. We are thus not encountering a “new” audience, or even a post-audience (if by that we mean *after* the audience). Instead, we will find ourselves in a dispersed milieu of practices that come to define media subjectivity. The key dynamics involved in understanding recent developments in participatory media culture (interactivity, sociality, co-creation, collectivity, affectivity) thus find a virtual existence throughout the history of audiencing.¹

Collective Subjects: Composition and Organization

What is this media subjectivity? For one thing, we need to examine it as the nexus of power and subjectivity. How were media subjects brought into being, rendered knowable, and made into a subject upon which to intervene? A methodological key here is to remove the individual from the center of the analysis. Instead, we focus on collectivity and powers. How does the history of audiences (especially in its earliest stages) present a portal into understanding the ways of assembling and theorizing collectives?

Understanding media subjectivity as a collective matter means foregrounding the *capacities of a collective body whose existence is mediated*. This phrase is one of the virtuals encased in the history of audiences and their problems/solutions. How does it take on a special tenor in an age defined by participation, collective intelligence, the wisdom of crowds, and interactivity?

We can turn here, as many autonomist social theorists do, to Spinoza, and ask: what is a mediated body capable of? Helpful are Spinoza’s fundamental insights

into capacity, affect, and bodies, now situated within the techniques of media subjectivation:

We know nothing about a body until we know what it can do, in other words, what its affects are, how they can or cannot enter into composition with other affects, with the affects of other bodies, either to destroy that body or to be destroyed by it, either to exchange actions and passions with it or to join with it in composing a more powerful body. (Deleuze & Guattari, 1987, p. 284)

These problematizations are not just invented in a discursive vacuum – they respond to activities of media subjectivation already occurring (Bratich, 2005). As we will see, they try on the one hand to neutralize and pacify some media actions (preventing enemy propaganda from reaching targets, dissuading alternative and dissenting practices). On the other, they attempt to capture, discipline, and shape media capacities (as market, public opinion, social movement, national identity, lifestyle, community).

Problematizations of audiences have been epistemological propositions, but they have also been *interventions*. They act on other actions, as conduct on conduct. Problematizations are actions that signify certain ways of being at the same moment that they encounter other beings. And how can we characterize the latter terms here (actions, conduct, beings)? Audiences are both the objects of audiencing discourses and signs of something that *exceeds* these capturing discourses. What is this excess, this surplus? The discussion below teases out a number of concepts that allow us to get to the ontology of this surplus: accumulation, self-valorization, composition, and constituent power.

Audiences are linked to the history of what Toni Negri (2005) calls ontological constitution and “ontological accumulation.” In characterizing capitalism, his autonomist approach argues that accumulation not only belongs to capitalist regimes of value-production but also emerges “from below, from the base of life” (Negri, 1999). Species-being – defined as the capacity to take powers as objects of will, consciousness, and practice – can encounter capital without being reduced to capitalism’s interruptions and forms of violence. The autonomist concept of *self-valorization* refers to how this value-generation of creative acts infuses the immanent needs and desires of the producing community and avoids being fully captured by capital (Cleaver, 1979; Dyer-Witheford, 2004; Negri, 1991; Virno & Hardt, 1996).

Audiencing takes an audience as an object of discipline, management, and encouragement (within limits). But as a composition, constituent power, capacity, and social value (what I have elsewhere called audience-power or mediated multitude), it is never fully captured by these discourses. Processes of media subjectivation exist alongside or within the audience problematizations, constituting the *longue durée* of accumulation and self-valorization. What media subjects do, as audiences and despite them, creates surplus: accumulations of value, power, and social relationships that no longer depend on external mechanisms to organize them or to realize their

virtues. This ontological foundation is “a concrete substratum which neither the conscience nor the memory attest, but only the continuity of struggles. And all the modifications, breaks and radical innovations gather around that constructed and re-found base, around that dynamic profile of a subjective ontology” (Negri, 2005, p. 138).

It helps to think about this subjective ontology if we introduce a bifurcation, drawn from Gilles Deleuze’s reading of Spinoza. Within the forms of interaction, two processes emerge: *organization* and *composition* (Armstrong, 1997). Organization refers to processes that externally mediate the forms according to transcendent values and ideals. Power here is “a principle of organization which subordinates the activity of things to a transcendent order” (Armstrong, 1997, p. 47). This “plan of organization”

directs the development of forms and the formation of subjects but *without itself being given in that which it gives*. It is a hidden structural and/or genetic principle that organizes and defines bodies in terms of their forms and their functions, in terms of the ends they are to serve. (Armstrong, 1997, p. 48, emphasis added)

Composition, in this Spinozan framework, designates immanent processes of transmission and transduction that begin at the lowest, most mundane interactions to combine capacities. Composition refers to how bodies enter into relations with one another (how they affect and are affected) – a coming-together which cannot be predicted from the component parts or interactions. This kind of plan “has no supplementary dimension; the process of composition must be apprehended for itself, through that which it gives, in that which it gives” (Deleuze, 1988, p. 128; see also Deleuze & Guattari, 1987, pp. 265–272). Composition involves “experimentally combining powers, by entering into different relations; only in this way are the powers and capacities of any particular body discovered” (Armstrong, 1997, p. 48).

Audiences exist as both organization and composition. Each problematization is a practical intervention and mediation that exists somewhere on the continuum between transcendence and immanence, operating on different plan(e)s. Audience as organization is produced through a problematization – a selection and a resolution. It is a discursive capture around forms and functions, assembled for particular ends and often with hidden structural principles. It is a *constituted power* (Negri, 1999).

Audience composition refers to the immanent processes of media subjectivation.² Recently, terms like “grassroots,” do-it-yourself (DIY), bottom-up, peer-to-peer, and co-production have been proffered to understand these processes. Composition refers to the experimental, the emergent, the not-yet-formed, the virtual. It is the milieu out of which the problematizations are formed. Composition is the noise to the selection mechanisms of the discursive captures; it primarily exists *in virtuo*, as *constituent power*. While we can begin the empirical work of naming and recovering some lost practices, it is vital to understand the virtual existence of practices before relying on those that are actual (and thus recoverable).

In this ontological dimension we can locate the political; specifically, the relation of audiences to democracy. Democracy here is not relegated to the political order often assumed in media studies, for instance, work on audience citizenship (Butsch, 2008). This privileging of the citizen (as member of a polity, as a nation-state subject), while offering numerous insights into the various discourses that problematized media subjects, remains at the level of *constituted power*. It takes for granted a particular sociopolitical order with its accompanying subject positions (as forms and functions). But constituent power, according to Toni Negri, has a broader scope. As a creative force, it is closely tied to interactions and associations defined as the powers of *demos* or multitude. Alberto Toscano (2005) notes that an ontological analysis begins with “forms of interaction,” political associations defined by a democratic dynamic *against* transcendence.

Drawn from Spinoza’s understanding of democracy as immanence, this multitude subjectivity is self-organized (composed of interactions whose constituent power refuses and resists capture by constituted power), in order to carefully cultivate, nurture, and affirm immanent powers. It is a type of direct democracy, but one that does not presume a people that is already ready to rule – it requires attention to the interactions that compose subjectivity (individual and collective). One would have to gauge any democratic order (as constituted power) insofar as it captures or encourages democracy (as constituent powers). A more familiar version of the question here, often put to modernity, is *how does each epoch of productive forces provide and inhibit emancipatory potential?* How do mediated forms amplify or interfere with the expression and affirmation of powers?

In the remainder of this chapter, I consider these dynamics of organization and composition through a variety of terms associated with audiences: masses and publics; consumers, receivers, spectators, social identities, active audiences (decoders), and finally fans. In each case, I examine the compositional issues embedded in the problematization. This approach draws a thread through these terms to unravel the knot encased in each. The point here is to see the “post-audience” within the audience, to identify themes that prefigure, persist, and mutate today. I then assess how the recent reconfiguration of media culture (the interregnum) reworks these associations, unleashing dynamics that take on new names. Audience studies goes on because its object has disappeared: what new mutants appear in the interregnum and how were they already incubating in its previous formulations?

Associated Terms³

In this section I examine the early twentieth-century conceptualization of emergent media collectivities. These problematizations of media collectives as masses and publics offer key themes relevant to studying contemporary media subjects. Each attempt at conceptualizing the audience encodes an ambivalence, namely one of

capture and overflow, of harnessing audience-powers yet not allowing them to get out of control. How did these audiences, through their newfound media powers, become both a resource and a threat to governance? How do today's interactivated media subjects find themselves within this ambivalence?

Masses

As Raymond Williams famously put it, there are “no masses, there are only ways of seeing people as masses” (1997, p. 20). He takes this nominalism one step further by claiming that we interpret masses “according to some convenient formula [. . .] it is the formula, not the mass, which it is our real business to examine” (p. 20). So what was at stake in defining media subjects as masses? To answer that, we need to return to the moment when amassing, mediated or not, was an object of concern.

The mass finds a predecessor in *crowds*. Sociologists, among others, have continually returned to the second half of the nineteenth century to understand the emergence of collective social agents. Crowds (and the more narrowly organized mob) were defined by Gustav Le Bon and Charles McKay via associations with irrationality, loss of individuality, passion, and imitation (Blackman, 2007; Borch, 2007; Brennan, 2004; Butsch, 2008). The amassing of a multitude was seen through biopolitical lenses, as a matter of health, disease, and contagion (Blackman, 2007; Brennan, 2004; Terranova, 2007). In other words, understanding crowds existed within a discourse whose objective was managing *populations*. The problematizations of audiences-as-masses took traits from this physical crowd and applied them to a faceless mass.

This is only one strand of audience history, the one tied to mass media. Audiences were already active as politically charged collective subjects (Butsch, 2008). During the French Revolution, a people – formed in some ways as audiences of plays and printed matter – mobilized against the monarchy. In the United States counterpart, performative publicity stunts like the Boston Tea Party called forth an audience to be provoked to action. After the Revolution, theaters became sites where Republicans contested Federalists, as audience members, over the control of what was happening on stage.

But there was one watershed event that fundamentally transformed the relation between composition and organization of collective powers, thereby setting the tone for future audience dynamics. As Richard Butsch (2008) persuasively argues, the history of audience rights took a severe turn in the Astor Place Opera House Riot of 1849.⁴ The Astor Place riot was a threshold event in the articulation between audience participation and the democratic tradition of rights and customs. In these crowd actions we see a shift from the rights of the audience to stop a performance to the right of an individual member to spectate without disruption. Butsch also notes that the crackdown on theater audiences was a crucial way of policing the streets in response to working-class organization. In this moment, amassing and problematizing the theatergoers as a violent mob severed the connection of audiences with the

Revolutionary heritage. Constituent power was disaggregated and the compositional capacities of media subjects were disrupted.

Media subjectivity was transcendently organized, first by treating audience actions as crimes to be policed. After bloody repression, a new organization appeared, one that installed the rational individual at the center of audience political subjectivity (endowed with the right to consume in peace, to choose his or her commodity in a disciplined space) (Butsch, 2008, p. 32).

These kinds of amassings later proved troublesome in other sites of reception, such as early cinemas. This time the problem was not the riotous assertion of rights but the unruly interactions (argumentative, criminal, sexual) at the sites, which brought in a policy apparatus (moral, legal, architectural) to discipline cinema spectators. The responses this time were not the brutal repression of bodies on streets but a material reorganization: in addition to enforced behavioral codes (silence during shows), discipline was spatial (fixed seating, ornate theaters, cost-prohibitive entry).

During the same period (1910–1930), the problematizing discourses transformed the masses from an actively unruly agent to a passively suggestible receiver. The earlier analysts of crowds also wrestled with this ambivalence. On the one hand, we have the collective power of *too much* agency – the danger to norms and constituted arrangements. On the other hand, each individual *lacks enough* agency – vulnerable to suggestion and imitation, even to hypnosis and the contagion of passions. Moral panic discourses proclaimed that this vulnerable mass needed to be protected from itself, and responded by implementing regulatory codes. Early audience studies was an extension of protection discourses' competitive claims to authority, often involving paternal organization of media subjects around the figure of the child.

What have we extracted so far from this moment of amassing? First and foremost, we have the techniques of managing collective media subjects. At this point the collective is mostly a threat. We could call this a type of *hyperpathy*, or excessive action (at least from the problematizers' standpoint).⁵ Dangerous crowds occupy a variety of spaces, including ones with media performances.

Media subjects were organized via cultivation, a spectator-discipline according to external standards (at times via codes of audience dress and conduct) (Butsch, 2008). The organization of interactions sought to regulate behavior, producing a political subject founded on austere protocols of rational behavior: media subjectivity as a self-disciplined consumer.

Ultimately, embedded in the problematizations of audiences as masses (its virtual knot) is the emerging collective power of mediated subjects. The constituent power of audiences is defined as a threat to constituted powers (challenging protocols, evading moral gazes, and eroding institutional boundaries). Participation-power, so useful during the Revolutionary period, now encounters its Thermidor. But more than just completely repressing these powers, the reactive constituted power starts to recognize the *usefulness* of these constituent powers. How, problematizers begin to ask, can we harness *and* nullify these capacities? For a better understanding of how they answered this question, we turn to the persistent organization of media subjects as *publics*.

Publics

It is difficult to imagine the history of media subjects apart from their ongoing association with the *public*. From defining early US print journalism as a Revolutionary force to linking Internet culture with a Habermasian public sphere, the public has been a regulative ideal for the problematization of audiences. Here I want to bifurcate this notion of the public into two political components. The first dimension refers to a political order comprised of citizenship, civic participation, electoral campaigns, and policymaking, as well as the construction of a communicative civil society that underpins them. The second dimension involves mobilizing opinion and consent, and comes in the form of public relations, public opinion, and propaganda.

The public is ambivalently related to the crowd, mob, and mass. At times it is strictly differentiated from the latter concepts, and at others the public *draws upon* elements of these other terms (within limits). Take the case of Sam Adams, who helped harness the riotous energy of the aggrieved and stood aside as confrontation with the colonial regime occurred. Then, when success was achieved for the emerging political class, this energy was targeted as a security threat (to wit, Adams's role in drafting the Massachusetts Riot Act) (Sandine, 2009).

A brief example related to early US print more clearly illuminates the role of media in this ambivalence. Newspapers (and other print modes of political information) were noted for their abilities to create an impersonal, abstract body of eyes that could act as rational watchdogs on the excesses of government (Warner, 1990). This public sphere would be a space of interaction for men of letters to depersonalize their self-interests toward a greater good.

However, news was not merely a site for the emergence of this political subject. Take this quotation from Thomas Jefferson regarding Shays's Rebellion, in which small farmers rebelled against debt collection and heavy taxes: "the way to prevent these irregular interpositions of the people is to give them the full information of their affairs thro' the channel of the public papers, and to contrive that those papers should penetrate the whole mass of the people" (quoted in Butsch, 2008, p. 81).

Shays's Rebellion was one among many signs that the Revolutionary spirit was still alive, a constituent power refusing to be nullified in a Constitution. Jefferson's sentiment makes clear that it was up to print to act as Thermidor, to prevent constituent power from continuing its ontological movement. When governments could not enact such repression, it was up to media to take on this governmentalized function.

Around a century later, we see a variation on this theme; this time with the tension between constituent and constituted power occurring *within* the press, namely as the tension that resulted in journalism's professionalization. Professional journalism arose in contradistinction to a type of popular news called "yellow journalism" (Bratich, 2008b; Schudson, 1978). This popular journalism had two components:

sensationalism (focus on scandal, imagery, emotion) and muckraking (motivated investigation, exposés of corruption, populist antagonism). The profession authorized itself in the name of the public, now defined against the disorderliness of the popular. The professional public, then, was founded on a management of certain affects (rage, resentment, empathy, pleasure) while cultivating others (scorn, disdain, loyal admiration).

A media-generated public, the key to informed citizenship, was an ideal open to all, but accompanied by the distinction between ideal subjects and the disqualified. These binaries ran down familiar lines: rationality/irrationality, reason/emotion, mind/body, discussion/action. Problematizing audiences as publics involved persuasion as well as dissuasion, the mobilization and immobilization of bodies, ideas, affects.

To understand these dual processes even further, we need to mention briefly key figures that bridge the bifurcated public (for an overview and synthesis of these pioneering perception engineers, see Ewen, 1996). For Walter Lippmann, most people were, when it came to political matters, innocent bystanders. They were deluged with propaganda and did not have the time or resources to make informed decisions. How was a spectator to distinguish the public from the private-disguised-as public? The answer here was to put the public in its place, namely as “interested spectators” (Bratich, 2008b; Ewen, 1996). Meanwhile, intellectual leaders were defined as agents with a special purpose, working to shape perception and assist in constructing that public. For these problematizers (social scientists and other “unseen engineers”), the public is to be formed via identifications with certain interests and alignment with objectives. This is done, for someone like Lippmann, via the *symbol* and images, which unify disparate positions and conflicting emotions.

In an apocryphal story, it was Lippmann himself who wrote to Woodrow Wilson urging the president to create a public-making mechanism in order to garner consent for the impending entry into the Great War. The resulting Committee on Public Information (or Creel Committee) launched the career of Edward Bernays, regarded as the father of public relations (PR). For Bernays, propaganda was necessary for democracy to narrow choices for the masses. Organization here is a type of winnowing and routing, a conduction of behavior through preassigned canals to fight off competing organizations (enemy propaganda).

George Creel, head of the Committee, saw that it was not enough to unify a population around information or principled beliefs. Needed was not “mere surface unity, but passionate belief in justice of America’s cause that should weld the people into *one white-hot mass instinct*” (in Ewen, 1996, emphasis added). The organization of publics was understood to work via *harnessing* the affective capacities previously attributed to unruly mass behavior. And it was understood that this organization required tactics that would mask their origins in the external governance agencies. Top-down directives had to appear as persuasion immanent to crowds, even coming *from* them. To accomplish this constituted-power-disguised-as-constituent power, Creel employed techniques like embedding opinion leaders in the population

(e.g., the Four Minute Men). From then on, stealth, peer-to-peer influence in organizing multitudes was to become a fixture.

The problematization of audiences-as-public *did* “take into consideration the pas-sional character of human existence” (Armstrong, 1997, p. 49). However, it did so to manage them via giving them forms and functions for ends externally imposed on the composition. It would be a mistake to think of this early public-making as a type of propaganda via the “hypodermic needle” model of communications. It is not a matter of injecting a message into people’s minds/brains. Rather, it involves a more nuanced perception management: identification, exercising desire, guiding attention. There is no unidirectional insertion by a mechanism here: it draws and attracts, seduces and evokes. As a public-making machine, this early audiencing involved capturing affections and controlling collective attention (Ewen, 1996, p. 136). Moreover, audiences were not just passive spectators but needed to be activated by “signals” to identify enthusiastically with narrative heroes, to inhabit dynamically the position of the official protagonist. A nascent form of active audience research was exhibited here, though it could be more accurately called “activated” audience research.

Managing the growing power of masses was paramount at this time, which meant devising means of recruiting, directing, and harnessing them (Ewen, 1996). The public was to be both domesticated and persuaded (to align with a position): an identification and a recruitment around an Us/Them. According to Edward Bernays, twentieth-century populations were more difficult to coordinate and unify than in the past, since in “modern nation-states any large undertaking needs public approval” (Ewen, 1996, p. 166). On the one hand, masses “throw their newly gained strength in the desired direction” (p. 167). At the same time, those masses cannot escape seduction by enemy forces, so “an antidote to willfulness” must be invented, according to Harold Lasswell (p. 175). The public becomes that antidote, organized through propaganda. Early audience studies was part of a broader public-making dispositif, where pastoral power meets psychology. This dispositif sought to understand how desire is composed in order to direct and conduct the powers toward transcendent ends. The audience is a target of knowledge and interventions – knowing the masses (crowd behavior, social psychology) in order to transform them via media instruments into publics aligned with constituted power.

Most importantly, however, there was an already-existing composition that needed *transforming*. Remember that the context for the problematization of audiences here is crisis, struggle, war, and specifically the *resistance* to war, the reluctance to be mobilized. This intransigence against external manipulation is what, for many problematizers, needed eroding via a “white-hot mass instinct” directed by the state for war.

At the same time that a public was being mobilized through persuasion, then, others were being immobilized through *dissuasion* (Virilio, 2000). The Espionage Act, and later its amended version as the Sedition Act, restricted the types of mediated expression for subjects. The Sedition Act criminalized “any disloyal, profane, scurrilous, or abusive language about the form of government of the United States [. . .] or

the flag of the United States, or the uniform of the Army or Navy.” Arrests were made for speeches, films, newsletters, anti-draft pamphlets, and other media forms. Along with the Palmer Raids, which resulted in mass arrests, these Red Scare, anti-dissent mechanisms all worked to ensure that only *particular* opinions and actions would be operational in the name of the public. Democracy, then, was the production of a particular type of demos, a constituted one in which the two publics worked together (e.g., one could become a rational citizen after and through PR’s dissuasion/persuasion).

To summarize then: one audience dynamic can be defined as *Public vs. Mass* (exclusion, banishing, dissuasion). Here cultivation is a prophylactic *against* masses. Suppressing uprisings, defusing dissent, immobilizing actions: mass power here is the inchoate composition whose powers have taken no constituted form but are eroding already-existing, constituted forms. This occurred in Jefferson’s call for news to act as Thermidor, in the Astor Place crackdowns, and the panics over cinema audience behaviors.

Another dynamic is the *Public as Transmuted Mass* (mobilization, cultivation, incitement). This appears first in the revolutionary heritage of mediated constituent power. Later, problematizers like Lippmann, Bernays, Creel, and Lasswell find within masses the necessary historical elements (the rise of mass power) that need careful study and conduction. Their mediated dimension is crucial: a wholesale mobilization of images, symbols, and affects, via the emerging systems of film, journalism, advertising, and propaganda, bifurcate mass constituent power into useful and dangerous, both now determined by constituted power. The power of media subjects to refuse and to self-organize was still recognized, so the reactive dispositif (a.k.a. enlightened political leaders) was forced to decompose these emerging forces.

The transmutation of a mass into a public is an action upon what Foucauldian scholars call the “population,” which was a recently emerging object of calculation during the turn of the twentieth century. According to Tiziana Terranova (2007), the public is not derived from a notion of civil society but from the biopolitical element of population. The population emerges along with the domain of the virtual, as an indefinite object imbued with powers and potentials. As Foucault (2005) put it, “the naturalness of the population makes it continually accessible to agents and techniques of transformation *on condition that these are enlightened, reasoned, led by analysis and calculus*” (p. 62, in Terranova translation, p. 137).

Masses bridge the population and the public by recognizing the vitality of collective media subjects, who are no longer primarily repressed but exercised, seduced, provoked, and canalized. The public is thus not just enacted as disembodied information and impersonal action. It arises out of the biological, economic, and spiritual life of a population. Governance mechanisms worked on this biopolitical sphere, including media subjectivity. Sometimes this was directly commissioned by the war-making state (mobilizing citizens to war and dissuading dissenters). Later, these mechanisms dispersed into the knowledge field – in universities, marketing research units, private foundations and think tanks, and then back into electoral campaigns and public opinion techniques. Attempts were made to organize populations under

elite orchestration, while preempting the compositional powers of independent activism. One of the main institutions that directed these populations in their desires and everyday lives is the consumer industry.

Consumers

The problematization of media subjects as consumers has been perhaps the most thoroughly studied development in media studies, so few words will be spent summarizing it here. Leiss, Kline, and Jhally (1997) define modern consumerism as the fusion of communication and selling, a merger of the audience (of mass-distributed ads) with buying subjects (of mass-produced goods). Consumer research throughout the twentieth century sought to understand the powers of desire through social science techniques, in order to stimulate and harness them. Knowledge here, of course, was designed to guide desirous behavior. A population identification shift occurred in the late nineteenth and early twentieth centuries, from religious, political, and ethnic traditions to ones based on aleatory individual selves whose desires could now be fulfilled with goods (Lears, 1983). In addition, subjects needed to change the conception of themselves from producers to consumers. A whole series of discourses, techniques, and institutions arose to channel old and new aspirations toward consumption and individualism.

Here we have the foundations for understanding contemporary collectivity: an aggregate of individuations, each with presumed desires that can be resolved individually in the consumer sphere. From the 1920s development of whisper copy/scare tactics to the twenty-first century's "affective marketing" with its emphasis on love and intimacy, consumer audience research has sought to know and insinuate itself into the subjectivation processes. Collective subjectivity is increasingly turned into individual brand attachments, encouraged and spurred via media (ads, stealth marketing stunts, games, environments, social media, and social interactions on and around brand platforms).

Critics of this consumer cultivation of media subjects need mentioning here, especially critical theory most often associated with the Frankfurt School. Horkheimer and Adorno's culture industry (2001) thesis is key to understanding audience powers and media subjectivity as composition/organization. Within the critical theory framework, the mass was depicted as targets, as deceived, as unable to resist. However, it is important to note that this framework refused to call it *mass* culture, as this would presume a bottom-up compositional culture that *inherently* lent itself to conformity and herd-like behavior. The Frankfurt School thus was not exactly an extension of the "culture and civilization" approaches from earlier decades (which themselves drew upon theories of the crowd). The culture and civilization sentiments were defined by fear of the masses, by the nineteenth-century desire to repress or, when able, to domesticate the passions of populations.

The culture industry thesis, in contrast, highlighted the class conflict at the heart of culture (Durham Peters, 2002).⁶ Classes were targeted and turned *into* masses by the culture industry. They were made to function as interchangeable, akin to industrial products. In other words, the industry operated by *organizing* media subjects (as consumers, as conformists, as submissive, as passive). Adorno and Horkheimer were describing, in grim and humorous detail, these organizing techniques. The authors bore witness to a tendency of turning culture into a factory, but not to make claims about human beings being conformists, sheep, and dopes. Instead, they used shock theory to activate the will of the industry's subjective targets, to transmute pacified (not passive) media subjects into compositionally active ones.

Critical theory, to be sure, attributed to the massified media subjects a weak capacity for resistance. But this was neither an innate nor ahistorical ontological trait: not inherent in the composition of forces, but an historical artifact. Near the end of his followup (in "Cultural Studies Reconsidered"), Adorno (2000) remarks on the "deep unconscious mistrust" shared by audiences (p. 37). The culture industry is thus responsible for transforming media subjectivity's powers *into* masses and then despising them, obstructing their tendency toward collective emancipation.

Recipients (a.k.a. Active Receivers)

The earliest propaganda research (later renamed public opinion and persuasion research) defined media subjects partially as passive recipients, as vulnerable (to enemy propaganda). But rather than define audiences as passive, we could say they were *potentially activated* (by any side's messages). In this way, we could see this early moment as a controlled modification of activating and pacifying receivers.

When persuasion research turned to a limited effects model, then, it was no major departure from early propaganda. Media subjects are still embedded in personal relations, which could be used to the advantage of the compliance seekers. Two-step flow models looked for a flexible counteraction to media subjects' resistance, developed feedback mechanisms to overcome media subjectivity intransigence (or the armored capacity to be affected) by highlighting the importance of human intermediaries.

This two-step tactic is a kind of immersion into composition, using indirect means to guide and organize from the bottom up (recall the Creel Committee's Four Minute Men). Peer influencers operate as what Raymond Williams (1997) called "agents" as opposed to "sources" – they exist as disseminators for others' agendas: bridging, translating, and mediating the transfer of the hidden source's message. In other words, a transcendent organizing effort. Even with limited effects models, then, the rationales remain the same – to understand and direct mobile, nomadic, "undecided" media subjects.

Active receivers take a different track later. As part of public opinion, media subjects can provide feedback (mostly on the effectiveness of campaigns directed at

them). This feedback mechanism finds its Cold War pinnacle in the audience research known as “uses and gratifications” – a framework in which the media subject is characterized as an abstract psychological individual guided by reason: a seeker of need fulfillment. As critics note, this approach overemphasized individual needs at the expense of understanding the social basis of needs and practices, overemphasized the mentalistic/psychologistic dimension, and ultimately was too functionalist. Media subjects here were ahistorical and collectivity meant an atomized aggregate of individuals, rather than social interactors and groups (Elliot, 1974).

Spectators

Across the Atlantic, media scholars were not so sanguine about the free, self-transparent media subject. Drawing primarily from the psychoanalytic tradition, film analysts and cinema theorists shaped a large body of work. While their primary object of study was not the audience (but rather the text, narrative codes, or cinematic apparatus), their equation of the audience with *spectators* set the agenda for much media scholarship. Psychoanalysis as such is preoccupied with the development of subjectivity, so it is no surprise that this spectator takes up a central position in the analysis. The subject of course is not equivalent to an individual. The subject is a temporary location, a space, a position, a function of a structuring system. A media subject was *placed* by an apparatus, which involved the material arrangement of the representational system, including the theater (lighting, seating, projection, screen) as well as the behavioral codes (immobility of the body, silence) (Bazin, 1967–1971; Metz, 1977). This subject was also interpellated by the dream-like discourse of the textual system.

The spectator’s activity entailed another set of operations, understood via psychoanalysis, namely the psychic processes that institute subjectivity. The spectator’s actions are unconscious, the dynamic play of forces of desire involving *projection* and *identification* (similar subjective processes that earlier in the century formed the basis for organizing techniques of PR and advertising). While psychoanalytic media studies saw its authority wane in the twenty-first century after decades of cultural studies’ critique, it bequeathed a number of key insights worth reviving in an age marked by participation, user-generation, and convergence.

This tradition reminds us that self-possession is itself a fantasy. It highlights, first, that users of systems are not free agents but enter into a space determined by codes, apparatuses, programs, and pathways. Moreover, those users do not necessarily (inter)act primarily through cognitive, rational, instrumental means. They are filled with contradictory desires, unconscious motives, and powerful (often hidden) fantasies. Subjectivity depends on *identification* with the objectives of system and its positions. In an intellectual context where cognitive studies and uses and gratifications models reinstall a single-minded rational individual at the center of research, it is important to preserve these shadow self practices.

Social Identities

Alongside psychology, another critique of the free and abstract individual emerged, but this one was also a critique of that psychoanalytic framework. This one saw *social relations* as determining identity, which would inform any uptake of the position of spectatorship. Understanding that any media subject is raced, gendered, sexualized meant complicating notions of both autonomous and determined media subjects.

While often called “identity,” this approach has not defined media subjectivity as a univocal, coherent, or self-possessed entity. Understanding audiences as identities meant foregrounding social division, hierarchies, and power differentials – not only to represent diverse media subjects, but also to undermine presumptions of a universal audience. The identity turn recognized texts as ideology, but also highlighted the counterpower of readings to refuse and rework representations. This asymmetry brought antagonism squarely into the heart of media subjectivity. Gender analyses were particularly exemplary.

Within feminist approaches to media subjectivity, gender is more than a demographic category. First, it was noted that the very diminution of mass or pop culture depended on *feminizing* the audience (Huyssen, 1986; Modleski, 1986; Petro, 1986). Second, much of cultural studies audience research was prompted by gender issues. The salvaging of pop culture from its debased status as low culture or trash culture was done via heavily feminized genres like romance novels (Radway, 1984), soap operas (Fiske, 1987; Geraghty, 1991), and young women’s magazines (McRobbie, 1982). Laura Mulvey’s (2001) canonical intervention-essay, “Visual Pleasure and Narrative Cinema,” remains one of the most reprinted essays in media studies. Her partial break from psychoanalysis was even more notable for spurring myriad responses *within* feminist studies. Gender analyses, far from toeing a particular line about identity in media subjects, were sites of ongoing debate and proliferation of difference.

Janice Radway’s (1984) germinal work on romance reading continued this tradition of controversy and brought to light the third element of gender and audiences, namely that gender identity and politics were often negotiated *through* media forms. Feminism has been directly engaged with the politics of representation and visibility, often within media texts (e.g., images of roles for women, body types, depictions of subordination as well as invisibility).

This concern with media has continued through the contemporary work on third-wave, postfeminist, and girlie culture research. Media subjectivity here continues to be concerned with representation; no longer as primarily a source of disempowerment but a type of subjective empowerment. Third-wave feminism raises questions about empowerment through commodity culture, spurring debate about the politics of pleasure and fantasy, and the ability to control appearances as a mode of agency. Moreover, gendered media subjectivity has moved beyond questions of consumption and reception to matters of *production*, be it via low-fi, DIY media (Kearney, 2006; Piepmeier, 2009), high-tech channels (Banet-Weiser, 2011; Lange, 2007; Senft, 2008),

or something in-between like the resurgence of craft culture (Bratich, 2010a; Robertson, 2006).

Girl power, as a mix of unresolvable tensions between agency and conformity, is the perfect example of contemporary audience power issues. The ambivalence of power (as system of oppression and as subjective capacitation) and of desire (as empowered self-expression and as Stockholm Syndrome-like decapacitation) is the forefront of understanding media subjectivity today. Gender and media (and more broadly, identity and media) are not particular cases of media subjectivity (whose unmarked general status is already gendered), but a terrain where contemporary issues around composition/organization are *first* negotiated.

Active Decoders

The active audience moment, like the identity moment, complicated the uniformity of the psychoanalytic interpellative system and its spectator subject by highlighting the social dimension. There was a gap between the viewing position of ideological spectatorship and the live individuals who occupied it, and this gap allowed for refusals, evasions, and contradictions. Texts can offer specific positions, but they cannot guarantee them.

The active audience turn in cultural studies arose from a different nexus of concerns than the active receiver of uses and gratifications. US mass communications research had operated within a problematic defined originally by persuasion studies, propaganda research, and direct effects on receivers. Media power was questioned for its effectiveness; understanding audiences meant highlighting the capacity of abstract individuals to work around message compliance (an obstacle) or to satisfy freely their psychological needs (a cause to champion). To put it in blunt Cold War terms, British cultural studies examined resistance to capitalist ideology through active audiences, while in the United States the activity of media subjects signified the American exceptionalist triumph of democracy in media culture.

Turning back to the Marxist problematic, then, popular culture became a resource for social actors to create resistant politics. John Fiske (1987, 1989), contrary to many of his detractors, did not simply celebrate or affirm consumer choices as resistant acts. Pop culture itself was not resistance but a *site of struggle* between power and resistance. Focusing on the vigor and vitality of people demonstrates, for Fiske, the *possibility* of social change and motivation to drive it. In other words, Fiske's analytic emphasis was on the virtual rather than the actual. His perspective located antagonism and conflict in the heart of what was taken to be homogeneous, common culture. He also framed this active media subject within a longer history of popular intransigence, persistence, and tenacity. He used Michel de Certeau's approach to pop culture (a series of operational schemas embedded in a long history of strategy, games, and war). This opened up commodity culture to an archaic *ontology*. Media subjectivity was an expression of a being through time, a contemporary formulation

of an historical ontology. It is this popular ontology, a type of constituent power, that would enact structural changes – not all at once, but after a long erosion and weakening of constituted power.

Finally, Fiske insisted on a media subjectivity that was not solely defined by a grim political composition whose only exit was a consciousness-raised rational action. Pleasure and play were not distractions from proper political work but part of the composition of one's everyday life that could become sources of resistance and transformation (while also remaining immanent and not just directed toward a transcendent organizational end, even if political).⁷

The active audience moment took a number of directions. Bodily and spatial dimensions were teased out, as in the ethnographies of domestic spaces and relations (Gray, 1999; Hay, 2003; Silverstone, 1996). Fiske's work was pilloried within cultural studies for its purported celebratory sentiments. Consumer culture apologists took it up as justification for the desires of media subjects (turning audience activity into the pluralism of choice rather than the proliferation of conflictual differences).

But perhaps the most prominent and lasting outcome of the active audience turn was the rise of fan studies. Fiske's most famous intellectual progeny, Henry Jenkins, has come to be identified with the success of fan studies, from his germinal *Textual Poachers* (1992) to the recent touchstone *Convergence Culture* (2006). What happened in between is significant, as he went from championing the underdog to depicting how the marginal became the victor. It is this line – the problematization of audiences as fans – that will open us up to the contemporary conjuncture that allows an assessment of the future of audience studies.

Fans

A quick summary of fans as media subjectivity is in order. Fans are more than active audiences. They produce their own culture, starting with the creation of artifacts (letters, columns, and zines, as well as collages, clubs, websites, conventions, videos, games). Their activity involves collective display and circulation.

Fan production involves two things relevant for the present argument: creating a *community* and creating a *world*. Fandom requires an individual's decoding power but is defined via the ensuing intersubjective and communicative practices. Fans shift across programs (following a genre, auteur, theme) to construct a fan community. Sociality and communication among audience members increase audience power insofar as media subjects increase connectivity and produce cultural value. Second, fans do not just generate interpretations, they make worlds through their own cultural production (videos, fan fiction, gatherings, online communities). As Jenkins (1992) notes, the fictional world is not created by the original text into which an audience steps; it is created by fans through texts and other artifacts (we can think here of such places as the Xenaverse, Buffyverse, or Potterverse).

But here we can extract a key element from the fan problematization by asking: what kinds of worlds? While the capacity of fans to produce worlds expresses the

powers of media subjects, it is also done through a necessary attachment to a commodity already given. The text or product's position is *ambivalent*: it is a resource for community and creative powers, but also an identificatory pole. This is the vexed nature of fan desire – attachments both composed by them and organized by the commodity/brand. The corporate structuration of those worlds not only limits possible extensions (through property battles), it draws value from fan interactions.

The ambivalence results from what social theorists call real subsumption, in which cultural production (even and especially from the grassroots) is fully commodified as value-maker. Fan work is revalorized – as buzz generator, as attention-attractor, as brand-enricher, as community-builder. To celebrate fan movement from the margins to the center of production means overlooking this process.

Instead of a fan victory, we can frame the process as fans being willingly captured or bought off with minor rewards (the flattery of being recognized, the social status within small groups, the occasional financial breakthrough of superfans). At the very least, we could say that fans are encouraged to express themselves as long as the communication is (potentially) valuable. Rather than seeing the marginal subjects as having moved *themselves* to the center (resulting in power sharing and co-creation), we can see that they were *made to function*; they were organized to produce financial value and to become workers in a social media factory.

None of this argument denies the empowerment of fans *as fans*. What is at issue here is the elevation of the fan into the media subject prototype for political actions. The ambivalence of fans as media subjects involves the tension between resistance and conformity. What are the identifications possible in a world constructed by subsumption? What types of antagonism are possible? We can briefly invoke the spirit of subcultures here, as subcultures lent themselves to lifestyle marketing (via their insularity, the internal hierarchies, the underestimation of capital's ability to tap subcultural practices for their value-generation).

With subsumption, where can we locate fan antagonism? While fan power occasionally impacts noneconomic discourses (e.g., religious censors), for the most part antagonism is drawn between fans and owners (be they auteurs like George Lucas or collective controllers like Electronic Blizzard). Fan antagonism, while having a potential for resistance to models of value-extraction and exploitation, is often reduced to modifying some of the terms of engagement. Their identification with, and dependence upon, external commodity forms makes their powers as media subjects more harnessable as majoritarian world-making than resisting in the name of a world to come.

Interactivity as/in the Interregnum

Fan subjectivity takes us to the defining issues of the audience in the interregnum. This interregnum has been referred to as convergence, participatory, configurable, remix, interactive culture. While some analysts narrow this down to recent technical

developments, media subjectivity shows us that digital and online tools have intensified and extended already-existing practices. The increase in collective powers (as unruly and harnessable), identification practices, social antagonism, creation of sociality and worlds, and the dynamic between organization and composition all find new salience, even as they are mutating. The following section takes these virtuals from the remediation of audience studies and maps their relevance to the interregnum. I focus on interactivity, not for its own sake but in order to unfold the virtuals in the concept. I also discuss its mutations (interpassivity, interactivism, inter-reactivity).

Convergence culture has been noted for the blurring of boundaries, collapse of binaries, and production of new hybrids (Jenkins, 2006). What are the remixed media subjects? How do we see the past morphing into future forms? Contemporary scholarship has already named some of these mutants: producers, prosumers, co-creators. At times, these hybrids take previous types and merge them as equals (and then occasionally tease out some minor asymmetries). Do hybrids equalize internal differences or are they composed of *unequal* elements? How do we reconstitute conflict, contradiction, and antagonism in convergence? A term like interactivity is as good a place to start as any, and the following paragraphs link it to a number of already discussed virtuals (identification, control, labor, conflict) to understand contemporary media subjectivity.

The technical protocols associated with new media have surpassed the most celebratory of the active audience problematizations by making media subjects *interactive*. How has active production been subsumed into interactivity? We first need to note a distinction made by others, namely *interactivity* vs. *participation*. For Jenkins, the distinction runs along human/technology lines: interactivity is technological, determined by design, with the goal of feedback into the system. Participation involves the social and cultural protocols in and around the technical ones. Mark Andrejevic (2007) does not draw such a strict line, noting that interactivity itself takes on different modes. There are two types of feedback: cybernetic (means) and goal-setting decisions (ends) (p. 201). Cybernetic participation is a type of interactivity that requires *identification* with goals, priorities, and values of institutional agents. Feedback is provided to fine-tune means, not determine ends. The steering (the *kyber* at the etymological root of *cyber*) is done via dominant actors rather than a publicly determined course. Media subjects, then, are recruited for harmony, alignment, and a shared definition of the situation with those who govern. While Jenkins affirms fans as media subjects with agency to shape courses, Andrejevic finds these subjects fraught with contradictions and muddled desires. The social and cultural protocols that Jenkins separates from the technical ones are themselves a type of governance. Protocols are resources *for* users but are also codes and techniques that produce subjects who are then *used*.

The contemporary turn toward a term like *users* only exacerbates this tension. If we think of users as individuals who instrumentalize a system for their own purposes, we have restored the uses and gratifications model of psychological indi-

viduation. Users are also positions within a system, a space much like that proposed by spectator theory, only now with added affordances. Identification with a system is now an interactive affair; alignment entails *giving* (e.g., feedback). And as the term *user's* connotations indicate, there is an addictive overattachment to technical protocols, with all of the drug user's ambivalence and contradictions. Media subjectivity's relation to technology begs an analysis of the processes of *identification* and *individuation*.

Interactivity, while often linked to freedom and participatory action, has been a resource for control mechanisms in governance and neoliberal capitalism. Andrew Barry's (1998) Foucauldian analysis locates interactivity's usefulness to governing conduct. Liberal governance now involves "intensive interaction with the public in carefully managed environments [which] is expected to maximize and intensify feedback between government and governed, and minimize possibilities for unexpected political controversies and future conflicts" (p. 178). Interactivity here has its roots in the earlier problematization of media subjects as masses. Governance involves an intervention into virtuals, a harnessing of capacities, while *preventing* useless or even dangerous kinds of emergence. Population management operates here not primarily by exclusion but by calculating and enhancing powers (within channels of conduction).

The labor of media subjects is also a type of interactivity. Dallas Smythe's (2001) contribution to understanding audiences as workers and creative activity now finds new salience. Autonomist media research has updated Smythe to understand the immaterial labor of online brand fans (Arvidsson, 2005), social media users (Andrejevic, 2010; Coté & Pybus, 2007; Hearn, 2010) and gamers (Dyer-Witheford & de Peuter, 2009). Much attention has been paid to attention as a scarce and highly demanded resource in an age of communicative capitalism and its cognitariat (Berardi, 2009; Dean, 2010). It is here we can complicate the research that flattens labor asymmetries into co-production. Who are the subjects of the "co" in co-production and co-creation? How do they resonate, how do they conflict? What are their identifications and individuations? Some analysts minimize the dissonance by giving consumers a new sovereignty (a digital media version of the way consumer culture studies de-fanged Fiske). But the "co" involves an intricate co-dependence, one imbued with dynamics of exploitation, conflicted identification, willful submission, and the vexed pleasures of media subjects as both *users* and *used*.

For recent thinkers of interactivity, Pierre Levy's term *collective intelligence* is rich and instructive. For Levy (1997), collective intelligence represents nothing less than a "new stage of *hominization*" (or the becoming-human of the species) (p. xxvi, emphasis added). More than producing a new type of subject, contemporary conditions make subjectivity *itself* a primary site of intervention: "because it conditions all other activities, the continuous production of subjectivity will most likely be the next major economic activity" (p. 4).

Others picked up on these dimensions a decade later through terms such as crowdsourcing (Howe, 2006), the wealth of networks (Benkler, 2006), and the wisdom of

crowds (Shirky, 2008; Surowiecki, 2004). Here we see an apparent turnaround from the approach to crowds a century earlier. But this is a departure only from the initial moment of problematizing media subjects as masses and crowds (as irrational and easily manipulated) in order to shun or neutralize them. The later version, one that harnesses mass power under the concept “public,” resonates with this twenty-first-century valorization. Tapping the powers of online collectivity to solve problems reduces composition to an instrument, organized by mechanisms that determine the problems defined elsewhere. Crowds here are not the unruly mixtures found in compositional gatherings; they do not interact via affect, they do not spread contagions.

Instead, they are an aggregate of disconnected individuals who come to form a temporary assemblage around a predetermined task (e.g., a scientific contest, marketing challenge, or governmental problem). Only when these mass forces have been disciplined, fragmented, and rationalized is it tolerable to “nodalize” them back into connectivity. Using the term “crowds” erases the historical association with unruly composition, replacing it with a public-disguised-as-crowd.

There is indeed much to laud about newfound powers of connectivity and sociality. But reducing these powers to the ability to generate knowledge and value for others, around a loose but homeostatic rationality, erases the antagonism, difference, and asymmetries in contemporary collective virtual powers. Dissuasion is still in operation in the actions of collective intelligence (Bratich, 2010b). Collective intelligence is still embedded in networked institutions of security and sovereignty, preempting the emergence of some user-generated usage while promoting others.

A term like general intellect, coming from the Italian autonomist tradition, enriches the concept of collective intelligence by embedding it in material production practices and subjective struggles. General intellect increases the labor power of workers via their heightened sociality (especially in nonwaged spheres like gaming, social networking platforms, fan sites, and other types of “free labor” [Terranova, 2000]). This results in both a wellspring of value captured by capital and a surplus of connectivity that is immeasurable and thus provokes a crisis in value-extraction.

Interactivity might be the most prominent term for processes of subjectivation in the interregnum, but there are others, actual and virtual. Slavoj Žižek’s term *interpassivity*, for instance, finds resonance for contemporary media subjectivity. With interpassivity, subjects defer action to machines, actively. Mark Andrejevic (2007) calls it *interpassive participation* (p. 173). Subjects knowingly submit to the imperatives of the technical, identifying with reified cybernetic objectives while claiming them as their own. This ideological dimension speaks to the constitution of media subjects (as matters of desire, identification, and pleasure) and moreover produces an ersatz participation that blocks its realization. Interpassivity also involves embodiment, as the haptic and kinesthetic dimensions of interactivity mesh with the machinic organization of body habits (Parisi, 2007).

We could also use a term like *interactivism* to refer to users’ engagement with their technological conditions to push the openness of systems, to appropriate their

authority, and to shape their vectors. Activist media subjects have taken on these new conditions of interactivity in order to intervene into this crisis and generate new forms of antagonism. Counterglobalization and grassroots struggles in the twenty-first century have used the Internet, mobile phones, and social media to mobilize (Berardi, Jacquemet, & Vitali, 2009; Juris, 2005; Kahn & Kellner, 2004; Kidd, 2003). Twitter and Facebook, for example, have been deployed as a crucial extension of both state warfare and social movement composition (Bratich, 2010a). We have seen versions of interactivism also emerge around hackers, modders, social movement media, Low Power FM and community wireless, where the shape of protocols and usage are at stake.

We do not need to focus on digital media to see this process at work. Interactivist media subjects have a long history within communications struggles, involving appropriation of protocols and usage for compositional ends. Here we could cite an entire history of radical media (Downing, 2001) and DIY media like zines (Duncombe, 1997; Piepmeyer, 2009). The politics of amateur uses and technical-social competences infused media subjects from early ham radio operators (Douglas, 1987) to CB users (Packer, 2008).

Interactivism involves an historical ontology, a movement through, with, and despite media forms. Interactivist media subjects require a shift in perspective, analyzing media development from below, highlighting the persistent efforts to create a common project through media, the composition of a cooperative ethos and a transversal power. These are often minoritarian practices, but ones whose very resilience is testimony to their virtues. This media constituent power signifies the ongoing accumulation of antagonisms within any media development, and a practical matter of building agency via “experimentation by composition” (Armstrong, 1997, p. 48). We can draw out this vital history as one that defines media subjectivity alongside, under, and against the audience studies that problematized it.

Finally, we can propose another new term, one which foregrounds the ethical component of media subjectivity: *inter-reactivity*. At play here are the affective processes of subjectivation, both the powers and the feelings that accompany them. *Reactivity* is a term both Spinozan and Nietzschean in its genesis (due to spatial constraints I will focus on the former). The affective turn often draws upon Spinozist philosophy (most prominently revived in sociopolitical theory by Michael Hardt and Toni Negri), which could use some brief explanation. The affections are the interactions of bodies when they encounter each other. For Spinoza, we begin in a state of reactivity (a receptivity, a power to be affected). These reactive interactions begin at the lowest level of encounters, involving passions and images (the imagination). We are constantly bombarded by random stimuli and find ourselves at the mercy of chance encounters. From these reactive encounters we form powers and relations.

What can we do as reactors? We need to understand the cause of our states – what is it that affects us one way or the other? Specifically, the traces of chance encounters (hidden to us) prevent us from understanding our own powers. Spinoza lays out what practical action needs to take place: we need to transform our subjectivity from being

at the mercy of chance encounters to having an understanding of effects upon it, and eventually knowing the *causes* of those affections. From here we can compose an active, even rational, body by understanding what is compatible, empowering, and affirmative, as well as determine what is incompatible, disempowering, and depleting. Inter-reactivity begins with this reactivity, and examines its acceleration, extension, and intensification with communication technologies and media connectivity. How are subjects filled with affections (passive or active) in their mediated interactions? How does any particular mediated organization of encounters deplete or augment the abilities of the subjects composed? More specifically, can the subjects adequately comprehend how those affections work on them?

Current organizations of multitude powers, with regard to media, produce a “collection of disconnected, isolated individuals able to act together” (Del Lucchese, 2009, p. 350). How do contemporary forms of interaction diminish the powers of subjects, leaving them isolated in their passions, then connecting them via their depletion? The pathological dimension of interactivity is a matter of public problematization. Moral panics regularly frame understandings of digital selves and data subjects around the depleting effects of hypermediation (reviving the early audience research figure of the child-as-victim in need of protection and discipline). But rather than allow these control mechanisms to define the debate and problematizations, critical media studies can address the ethical dimension of interactivity. Media studies needs to contribute intelligently to the understanding of pathologies, the (de)composition of bodies via exhaustion, frustration, peer-to-peer surveillance, judgment, and other debilitating transindividual affects.
